Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

with a safety alert symbol, indicates that minor personal injury can result if proper precautions are not taken.

CAUTION

without a safety alert symbol, indicates that property damage can result if proper precautions are not taken.

NOTICE

indicates that an unintended result or situation can occur if the relevant information is not taken into account.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Table of contents

1 System overview of STEP 7 and WinCC 23

1.1 Scaling of STEP 7 and WinCC 23

1.2 Options for STEP 7 Engineering System 25

1.3 Options for WinCC Engineering and Runtime systems 26

2 Readme 29

2.1 General notes 29
2.1.1 General notes 29
2.1.2 Notes on the installation 33
2.1.3 Use of communications processors 35

2.2 STEP 7 Basic 36
2.2.1 Notes on use 36
2.2.2 Editing devices and networks 37
2.2.2.1 General information on devices and networks 37
2.2.2.2 System reaction of the S7-1200 CPU with firmware version V2.0 37
2.2.2.3 Replacing the ET 200S pulse generator and positioning modules 37
2.2.2.4 Setting flow control for CM 1241 (RS232) 38
2.2.2.5 Notes on online and diagnostics 38
2.2.2.6 Compiling the hardware of a pulse generator 39
2.2.3 Programming a PLC 39
2.2.3.1 General notes on PLC programming 39
2.2.3.2 Instructions 40
2.2.3.3 Testing the user program 41
2.2.4 Technology functions 42
2.2.4.1 Notes on technology functions (S7-1200) 42

2.3 WinCC Readme 43
2.3.1 Notes on use 43
2.3.2 Migration 45
2.3.3 Engineering System 47
2.3.3.1 Screens and Screen Objects 47
2.3.3.2 Tags 50
2.3.3.3 Alarm system and alarm displays 51
2.3.3.4 System functions 51
2.3.3.5 Recipes 51
2.3.3.6 User administration 51
2.3.3.7 Communication 52
2.3.4 Compiling and loading 55
2.3.5 Runtime 58
2.3.5.1 Notes on operation in Runtime 58
2.3.5.2 Notes on operation of panels in Runtime 59
2.3.6 HMI devices 59
2.3.6.1 General notes 59

3 Installation 61

3.1 System requirements for installation ... 61
3.1.1 Notes on the system requirements ... 61
3.1.2 System requirements STEP 7 Basic ... 62
3.1.2.1 Software and hardware requirements STEP 7 ... 62
3.1.3 System requirement for WinCC Basic ... 63
3.1.3.1 Software and hardware requirements ... 63
3.1.3.2 Licenses and Powerpacks ... 66

3.2 Licenses ... 71

3.3 Installation log ... 72

3.4 Starting installation ... 73

3.5 Installing Support Packages ... 76

3.6 Displaying the installed software ... 77

3.7 Modifying or updating installed products ... 78

3.8 Repairing installed products ... 80

3.9 Starting to uninstall ... 82

3.10 Installing and uninstalling the migration tool ... 84
3.10.1 System requirements ... 84
3.10.2 Installing the migration tool ... 84
3.10.3 Uninstalling the migration tool ... 85

4 Migrating projects ... 87

4.1 Migrating projects ... 87

4.2 Preparing projects with the migration tool ... 89
4.2.1 Migrating projects with the migration tool ... 89
4.2.2 Calling the migration tool ... 90
4.2.3 Creating a migration file ... 91

4.3 Migrating projects ... 92

4.4 Displaying the history of the migration ... 94

4.5 Displaying the log file of the migration ... 95

4.6 Migrating STEP 7 projects ... 96
4.6.1 Migration of STEP 7 projects ... 96
4.6.2 Requirements for the migration of STEP 7 projects ... 98
4.6.3 Checking whether STEP 7 projects can be migrated ... 99
4.6.4 Removing unsupported hardware components ... 100
4.6.5 Special points to observe during migration ... 100
4.6.5.1 Device names ... 100
4.6.5.2 PROFINET IO configurations ... 101
4.6.5.3 PROFIBUS configurations ... 102
4.6.5.4 Connections ... 103
4.6.5.5 Multiprojects ... 104
4.6.5.6 Messages ... 104
4.6.5.7 Reporting system errors ... 105
4.6.5.8 Migrating program blocks ... 105

4.7 Migrating WinCC flexible projects (Basic) ... 114
4.7.1 Basics (WinCC flexible) ... 114

4.7.1.1 Migration (WinCC flexible) 114
4.7.1.2 Basics on migration (WinCC flexible) 115
4.7.1.3 Projects from Migrating WinCC flexible projects (WinCC flexible) 117
4.7.1.4 Compiling and loading a migrated project (WinCC flexible) 119
4.7.2 Migrating engineering data (WinCC flexible) 120
4.7.2.1 Supported HMI devices (WinCC flexible) 120
4.7.2.2 Object support during migration (WinCC flexible) 122
4.7.2.3 Changes of values of object properties by the migration (WinCC flexible) 124
4.7.2.4 Migration tags (WinCC flexible) 125
4.7.2.5 Migration of alarm classes and alarm groups (WinCC flexible) 126
4.7.2.6 Migration of language-dependent contents (WinCC flexible) 129
4.7.2.7 Migrating libraries (WinCC flexible) 131
4.7.3 Migrating runtime data (WinCC flexible) 132
4.7.3.1 Migrating runtime data (WinCC flexible) 132
4.7.3.2 Backing up recipe data and user administration (WinCC flexible) 133
4.7.3.3 Restoring recipe data and user administration (WinCC flexible) 134
4.7.4 Migrating integrated projects (WinCC flexible) 135
4.7.4.1 Migrating integrated projects (WinCC flexible) 135
4.7.4.2 Migrating an integrated project (WinCC flexible) 136
4.7.5 Reference (WinCC flexible) 139
4.7.5.1 Migration of data types (WinCC flexible) 139
4.7.5.2 Migrating data types of Allen-Bradley DF1 (WinCC flexible) 140
4.7.5.3 Migrating data types of Allen-Bradley Ethernet IP (WinCC flexible) 141
4.7.5.4 Migrating data types of Mitsubishi FX (WinCC flexible) 142
4.7.5.5 Migrating data types of Modicon Modbus (WinCC flexible) 143
4.7.5.6 Migrating data types of Modicon Modbus TCP/IP (WinCC flexible) 143
4.7.5.7 Migrating data types of Omron Hostlink/Multilink (WinCC flexible) 144
4.7.5.8 Migrating data types of SIMATIC S7 200 (WinCC flexible) 145
4.7.5.9 Migrating data types of SIMATIC S7 300/400 (WinCC flexible) 146

4.8 Post-editing integrated projects 150
4.8.1 Migrating an integrated project 150
4.8.2 Post-editing integrated projects 152
4.8.3 Converting unspecified CPUs into specified CPUs 153
4.8.4 Creating an integrated HMI connection 155
4.8.5 Re-linking HMI tags 157
4.8.6 Deleting an unspecified connection 158

5 First steps 159

5.1 Getting Started Documentation 159

6 Introduction to the TIA Portal 161

6.1 User interface and operation 161
6.1.1 Starting, setting and exiting the TIA Portal 161
6.1.1.1 Starting and exiting the TIA Portal 161
6.1.1.2 Overview of the program settings 162
6.1.1.3 Overview of the script and text editor settings 164
6.1.1.4 Overview of the print settings 165
6.1.1.5 Changing the settings 166
6.1.2 Layout of the user interface 166
6.1.2.1 Views 166
6.1.2.2 Portal view 167
6.1.2.3 Project view 169

6.1.2.4 Project navigation ... 171
6.1.2.5 Work area ... 175
6.1.2.6 Inspector window ... 184
6.1.2.7 Task cards ... 186
6.1.2.8 Details view ... 189
6.1.2.9 Overview window ... 190
6.1.2.10 Resetting the user interface layout ... 193
6.1.3 Keyboard shortcuts ... 194
6.1.3.1 Keyboard shortcuts for project editing ... 194
6.1.3.2 Keyboard shortcuts for windows ... 195
6.1.3.3 Keyboard shortcuts in the project tree ... 195
6.1.3.4 Keyboard shortcuts in tables ... 195
6.1.3.5 Keyboard shortcuts for text editing ... 196
6.1.3.6 Using the on-screen keyboard ... 197
6.1.4 Special features specific to the operating system ... 197
6.1.4.1 Influence of user rights ... 197
6.1.4.2 Expanding user rights ... 198

6.2 Help on the information system ... 200
6.2.1 General remarks on the information system ... 200
6.2.2 Opening the Help system ... 203
6.2.3 Searching the Help system for keywords ... 203
6.2.4 Full-text searches ... 204
6.2.5 Using favorites ... 205
6.2.6 Printing help topics ... 206
6.2.7 Disabling the automatic display of tooltip cascades ... 206
6.2.8 Safety Guidelines ... 207

7 Editing projects ... 209

7.1 The basics of projects ... 209

7.2 Creating and managing projects ... 210
7.2.1 Creating a new project ... 210
7.2.2 Opening projects ... 210
7.2.3 Displaying properties of the project ... 212
7.2.4 Saving projects ... 213
7.2.5 Closing projects ... 213
7.2.6 Deleting projects ... 214
7.2.7 Working with multi-language projects ... 215
7.2.7.1 Project text basics ... 215
7.2.7.2 Select project languages ... 217
7.2.7.3 Setting the editing language ... 217
7.2.7.4 Translating texts directly ... 218
7.2.7.5 Translating texts using reference texts ... 219
7.2.7.6 Exporting and importing project texts ... 220
7.2.7.7 Application examples for multilanguage projects ... 222

7.3 Editing project data ... 224
7.3.1 Compiling and loading project data ... 224
7.3.1.1 Compiling project data ... 224
7.3.1.2 Downloading project data ... 226
7.3.2 Comparing project data ... 233
7.3.2.1 Basics of project data comparison ... 233
7.3.3 Protecting project data ... 234

7.3.3.1 Protection concept for project data 234
7.3.3.2 Revoking access rights for devices....235
7.3.4 Printing project contents 235
7.3.4.1 Documentation settings 235
7.3.4.2 Printout of project contents 237
7.3.4.3 Changing the print settings 238
7.3.4.4 Specifying the print layout....239
7.3.4.5 Entering document information....240
7.3.4.6 Managing cover pages and frames 241
7.3.4.7 Designing cover pages and frames 244
7.3.4.8 Displaying print preview....251
7.3.4.9 Printing project data....254

7.4 Undoing and redoing actions 257
7.4.1 Basics of undoing and redoing actions....257
7.4.2 Undoing an action....259
7.4.3 Redoing an action....260

7.5 Finding and replacing in projects....261
7.5.1 Information on the search function 261
7.5.2 Search and replace....262

7.6 Working with text lists 264
7.6.1 Text lists....264
7.6.2 Creating user-defined text lists 266
7.6.3 Editing user-defined text lists....267
7.6.4 Editing system-defined text lists....267

7.7 Using memory cards....269
7.7.1 Basics about memory cards....269
7.7.2 Adding a user-defined card reader 269
7.7.3 Accessing memory cards....270
7.7.4 Displaying properties of memory cards 271

7.8 Using libraries 272
7.8.1 Library basics....272
7.8.2 "Libraries" task card 273
7.8.3 Using the elements and parts view....276
7.8.4 Working with the project library....276
7.8.4.1 Project library basics....276
7.8.4.2 Creating folders in the project library 277
7.8.4.3 Adding elements to the project library 277
7.8.4.4 Using elements of the project library 279
7.8.4.5 Editing elements of a project library....282
7.8.4.6 Removing elements from the project library 284
7.8.4.7 Filtering the view 285
7.8.5 Working with global libraries 285
7.8.5.1 Global library basics....285
7.8.5.2 Creating a new global library 286
7.8.5.3 Opening a global library....287
7.8.5.4 Displaying properties of global libraries....288
7.8.5.5 Saving a global library....289
7.8.5.6 Closing a global library....290
7.8.5.7 Deleting a global library 291
7.8.5.8 Creating folders in the global libraries 292

7.8.5.9 Adding elements to a global library 293
7.8.5.10 Using elements of a global library 295
7.8.5.11 Editing elements of a global library 298
7.8.5.12 Removing elements from a global library 300
7.8.5.13 Using a supplied global library 301
7.8.5.14 Filtering the view 302

7.9 Using cross-references 303
7.9.1 Using cross-references 303

7.10 Simulating devices 304
7.10.1 Simulation of devices 304
7.10.2 Starting the simulation 304

8 Editing devices and networks 305

8.1 Configuring devices and networks 305
8.1.1 Hardware and network editor 305
8.1.1.1 Overview of hardware and network editor 305
8.1.1.2 Network view 307
8.1.1.3 Device view 310
8.1.1.4 Topology view 313
8.1.1.5 Printing hardware and network configurations 315
8.1.1.6 Activating the page break preview for printout 317
8.1.1.7 Changing the print options 317
8.1.1.8 Inspector window 318
8.1.1.9 Hardware catalog 320
8.1.1.10 Information on hardware components 322
8.1.1.11 Enabling product support 323
8.1.1.12 Keyboard action in the hardware and network editor 324
8.1.2 Configuring devices 325
8.1.2.1 Basics 325
8.1.2.2 Configuring individual devices 334
8.1.3 Configure networks 348
8.1.3.1 Networking devices 348
8.1.3.2 Communication via connections 369
8.1.3.3 Displaying and configuring topology 414
8.1.4 Creating configurations 430
8.1.4.1 Configurations for automation systems 430
8.1.4.2 Configurations for PROFIBUS DP 465
8.1.4.3 Configurations for PROFINET IO 488
8.1.4.4 Bus coupling with PN/PN coupler 519
8.1.4.5 Configurations using external tools 521
8.1.4.6 Loading a configuration 523
8.1.5 Additional information on configurations 525
8.1.5.1 Functional description of S7-1200 CPUs 525
8.1.5.2 Distributed I/O 588
8.1.5.3 Parameters of analog modules 619
8.1.6 System diagnostics with 'Report System Errors' 620
8.1.6.1 Introduction to system diagnostics with 'Report System Errors' 620
8.1.6.2 Basics of system diagnostics 620
8.1.6.3 Components supported 621
8.1.6.4 Diagnostics blocks for reporting system errors 622
8.1.6.5 Properties of the blocks 622

8.1.6.6 Supported error OBs....623
8.1.6.7 Overview of the status DBs....624
8.1.6.8 Diagnostics status DB....625
8.1.6.9 PROFINET IO DB....628
8.1.6.10 PROFIBUS DP DB....631
8.1.6.11 Displaying settings of system diagnostics....633
8.1.6.12 Basic settings....633
8.1.6.13 Advanced settings....637
8.1.7 Displaying alarms....641
8.1.7.1 Overview of the alarm display....641
8.1.7.2 Archive view....642
8.1.7.3 Layout of the alarms in the archive view....642
8.1.7.4 Receiving alarms....643
8.1.7.5 Export archive....643
8.1.7.6 Clear archive....643
8.1.7.7 "Active alarms" view....644
8.1.7.8 Layout of the alarms in the "Active alarms" view....644
8.1.7.9 Status of the alarms....644
8.1.7.10 Acknowledging alarms....645
8.1.7.11 Ignoring alarms....646
8.1.7.12 Keyboard commands in the alarm display....646

8.2 Device and network diagnostics....647
8.2.1 Hardware diagnostics....647
8.2.1.1 Overview of hardware diagnostics....647
8.2.1.2 Showing non-editable and current values of configurable module properties....656
8.2.1.3 Showing the current values of dynamic modules properties....661
8.2.1.4 Checking a module for defects....664
8.2.1.5 Changing the properties of a module or the programming device / PC....670
8.2.1.6 Diagnostics in STOP mode....678
8.2.1.7 Online accesses in the Online and Diagnostics view....680
8.2.1.8 Checking PROFIBUS DP subnets for faults....683
8.2.2 Connection diagnostics....686
8.2.2.1 Overview of connection diagnostics....686
8.2.2.2 Displaying the connection status using icons....687
8.2.2.3 Detailed connection diagnostics....688

9 Programming a PLC....693

9.1 Creating a user program....693
9.1.1 Programming basics....693
9.1.1.1 Operating system and user program....693
9.1.1.2 Blocks in the user program....694
9.1.1.3 Block calls....702
9.1.1.4 Operands in instructions....716
9.1.1.5 Data types....741
9.1.1.6 Program flow control....819
9.1.2 Declaring PLC tags....824
9.1.2.1 Overview of PLC tag tables....824
9.1.2.2 Structure of the PLC tag tables....825
9.1.2.3 Creating and managing PLC tag tables....826
9.1.2.4 Declaring PLC tags....829
9.1.2.5 Declaring symbolic constants....835
9.1.2.6 Editing properties....837

9.1.2.7 Monitoring of PLC tags 840
9.1.2.8 Editing PLC tag tables 840
9.1.3 Creating and managing blocks 844
9.1.3.1 Creating blocks 844
9.1.3.2 Specifying block properties 853
9.1.3.3 Managing blocks 859
9.1.4 Programming blocks 863
9.1.4.1 Program editor 863
9.1.4.2 Programming code blocks 875
9.1.4.3 Programming data blocks 1014
9.1.4.4 Programming PLC data types 1036
9.1.4.5 Using external source files 1047
9.1.5 Comparing project data 1052
9.1.5.1 Basics of comparing project data 1052
9.1.5.2 Carrying out an online/offline comparison 1056
9.1.5.3 Carrying out offline/offline comparisons 1057
9.1.5.4 Using the comparison editor 1059
9.1.5.5 Performing detailed block comparisons 1065
9.1.6 Compiling and downloading blocks 1071
9.1.6.1 Compiling blocks 1071
9.1.6.2 Downloading blocks 1076
9.1.7 Protecting blocks 1085
9.1.7.1 Protecting blocks 1085
9.1.7.2 Setting up and removing block copy protection 1087
9.1.7.3 Setting up block know-how protection 1088
9.1.7.4 Opening know-how protected blocks 1089
9.1.7.5 Printing know-how protected blocks 1090
9.1.7.6 Changing a password 1091
9.1.7.7 Removing block know-how protection 1092

9.2 Displaying program information 1093
9.2.1 Overview of available program information 1093
9.2.2 Displaying an assignment list 1094
9.2.2.1 Introduction to the assignment list 1094
9.2.2.2 Layout of the assignment list 1095
9.2.2.3 Symbols in the assignment list 1096
9.2.2.4 Displaying an assignment list 1097
9.2.2.5 Setting the view options for the assignment list 1098
9.2.2.6 Filter options in the assignment list 1099
9.2.2.7 Defining filters for assignment list 1100
9.2.2.8 Filtering an assignment list 1101
9.2.2.9 Defining retentive memory areas for bit memories 1101
9.2.2.10 Enabling the display of retentive bit memories 1102
9.2.3 Displaying the call structure 1103
9.2.3.1 Introduction to the call structure 1103
9.2.3.2 Symbols in the call structure 1105
9.2.3.3 Layout of the call structure 1106
9.2.3.4 Displaying the call structure 1107
9.2.3.5 Setting the view options for the call structure 1108
9.2.3.6 Introducing the consistency check in the call structure 1109
9.2.3.7 Checking block consistency in the call structure 1110
9.2.4 Displaying the dependency structure 1111
9.2.4.1 Introduction to the dependency structure 1111

9.2.4.2 Layout of the dependency structure 1112
9.2.4.3 Symbols in the dependency structure....1113
9.2.4.4 Displaying the dependency structure....1113
9.2.4.5 Setting the view options for the dependency structure 1114
9.2.4.6 Introducing the consistency check in the dependency structure 1115
9.2.4.7 Checking block consistency in the dependency structure 1116
9.2.5 Displaying CPU resources 1117
9.2.5.1 Introducing resources 1117
9.2.5.2 Layout of the "Resources" tab 1119
9.2.5.3 Displaying resources....1120
9.2.5.4 Selecting the maximum load memory available 1120

9.3 Displaying cross-references....1121
9.3.1 General information about cross references....1121
9.3.2 Structure of the cross-reference list 1122
9.3.3 Displaying the cross-reference list 1124
9.3.4 Displaying cross-references in the Inspector window....1125

9.4 Testing the user program....1127
9.4.1 Basics of testing the user program 1127
9.4.2 Testing with program status....1128
9.4.2.1 Testing the program....1128
9.4.3 Testing with the watch table....1133
9.4.3.1 Introduction to testing with the watch table....1133
9.4.3.2 Layout of the watch table 1134
9.4.3.3 Basic mode and expanded mode in the watch table 1135
9.4.3.4 Icons in the watch table 1136
9.4.3.5 Creating and editing watch tables....1137
9.4.3.6 Entering tags in the watch table....1140
9.4.3.7 Monitoring tags in the watch table 1145
9.4.3.8 Modifying tags in the watch table....1149
9.4.4 Testing with the force table 1156
9.4.4.1 Introduction for testing with the force table 1156
9.4.4.2 Safety precautions when forcing tags....1158
9.4.4.3 Layout of the force table 1159
9.4.4.4 Basic mode and expanded mode in the force table 1160
9.4.4.5 Icons in the force table....1160
9.4.4.6 Open and edit force table....1161
9.4.4.7 Entering tags in the force table 1162
9.4.4.8 Monitoring tags in the force table....1167
9.4.4.9 Forcing tags in the force table....1170
9.4.4.10 Stop forcing tags 1178

9.5 Configuring alarms 1181
9.5.1 Introduction to alarm configuration 1181
9.5.2 Assigning alarm numbers 1181
9.5.3 Components of an alarm....1182
9.5.4 Available alarm blocks 1182
9.5.5 Alarm type and alarms 1183
9.5.6 Formal parameters, alarm data types and alarm blocks 1185
9.5.7 Layout of the alarm editor 1186
9.5.8 Creating and editing alarms 1187
9.5.8.1 Creating PLC alarms....1187
9.5.8.2 Edit PLC alarms in the alarm editor 1188

9.5.8.3 Edit PLC alarms in the program editor ... 1188
9.5.8.4 Deleting PLC alarms ... 1189
9.5.8.5 Creating and editing an alarm type ... 1189
9.5.8.6 Creating and editing an instance DB ... 1189
9.5.8.7 Creating user diagnostic messages ... 1190
9.5.8.8 Editing user diagnostic alarms ... 1191
9.5.8.9 Deleting user diagnostic messages ... 1191
9.5.8.10 Entering texts ... 1191
9.5.8.11 Locking texts ... 1192
9.5.8.12 Locking attributes ... 1193
9.5.8.13 Insert associated values in alarms ... 1193
9.5.8.14 Structure of associated values ... 1194
9.5.8.15 Examples of associated values ... 1195
9.5.8.16 Deleting associated values ... 1196
9.5.9 Text lists for alarms ... 1196
9.5.9.1 Basics of alarm text lists ... 1196
9.5.9.2 Editing text lists for alarms ... 1196
9.5.9.3 Integrating texts from text lists in alarms ... 1197
9.5.9.4 Example of integrating texts from text lists in alarms ... 1198
9.5.10 Alarm classes ... 1198
9.5.10.1 Creating alarm classes ... 1198
9.5.10.2 Editing alarm classes ... 1199

9.6 Using global project functions ... 1200
9.6.1 Importing and exporting ... 1200
9.6.1.1 Basics for importing and exporting ... 1200
9.6.1.2 Format of the export file ... 1200
9.6.1.3 Exporting PLC tags ... 1201
9.6.1.4 Importing PLC tags ... 1202

9.7 Programming examples ... 1203
9.7.1 LAD programming examples ... 1203
9.7.1.1 Example of controlling a conveyor belt ... 1203
9.7.1.2 Example of detecting the direction of a conveyor belt ... 1204
9.7.1.3 Example of detecting the fill level of a storage area ... 1206
9.7.1.4 Example of controlling room temperature ... 1209
9.7.2 FBD programming examples ... 1211
9.7.2.1 Example of controlling a conveyor belt ... 1211
9.7.2.2 Example of detecting the direction of a conveyor belt ... 1212
9.7.2.3 Example of detecting the fill level of a storage area ... 1214
9.7.2.4 Example of controlling room temperature ... 1217

9.8 References ... 1220
9.8.1 General parameters of the instructions ... 1220
9.8.1.1 Meaning of the parameters REQ, RET_VAL and BUSY with asynchronous instructions ... 1220
9.8.1.2 Evaluating errors with output parameter RET_VAL ... 1222
9.8.2 Basic instructions ... 1226
9.8.2.1 LAD ... 1226
9.8.2.2 FBD ... 1393
9.8.2.3 SCL ... 1565
9.8.3 Extended instructions ... 1668
9.8.3.1 Date and time-of-day ... 1668
9.8.3.2 String + Char ... 1678
9.8.3.3 Distributed I/O ... 1700

9.8.3.4 Interrupts 1729
9.8.3.5 Diagnostics 1745
9.8.3.6 Pulse 1755
9.8.3.7 Data logging 1757
9.8.3.8 Data block functions 1767
9.8.4 Technology 1771
9.8.4.1 PID Control 1771
9.8.4.2 Motion Control 1816
9.8.4.3 High-speed counters 1848
9.8.5 Communication 1850
9.8.5.1 S7 communication 1850
9.8.5.2 Open User Communication 1859
9.8.5.3 Web server 1893
9.8.5.4 Communications processor 1895
9.8.5.5 TeleService 1958

10 Visualizing processes (Basic) 1967

10.1 Creating screens 1967
10.1.1 Basics 1967
10.1.1.1 Screen basics 1967
10.1.1.2 Availability of screens for specific HMI devices 1969
10.1.1.3 Basics 1970
10.1.1.4 Working with screens 1974
10.1.1.5 Working with Templates 1977
10.1.2 Working with objects 1983
10.1.2.1 Overview of objects 1983
10.1.2.2 Options for Editing Objects 1986
10.1.2.3 Inserting an object 1987
10.1.2.4 Deleting an Object 1989
10.1.2.5 Positioning an object 1990
10.1.2.6 Resizing an object 1991
10.1.2.7 Selecting multiple objects 1992
10.1.2.8 Aligning objects 1995
10.1.2.9 Moving an object forward or backward 1997
10.1.2.10 Show objects outside the screen area 1998
10.1.2.11 Rotating objects 1998
10.1.2.12 Flipping objects 2000
10.1.2.13 Designing an object 2001
10.1.2.14 Inserting multiple objects of the same type (stamping tool) 2001
10.1.2.15 Repositioning and resizing multiple objects 2003
10.1.2.16 External graphics 2004
10.1.2.17 Managing external graphics 2005
10.1.2.18 Storing an external image in the graphics library. 2007
10.1.2.19 Working with object groups 2009
10.1.2.20 Configuring the keyboard access 2015
10.1.2.21 Examples 2019
10.1.3 Working with text lists and graphics lists 2022
10.1.3.1 Working with text lists 2022
10.1.3.2 Working with graphics lists 2029
10.1.4 Dynamizing screens 2038
10.1.4.1 Basics on dynamization 2038
10.1.4.2 Dynamization in the inspector window 2038

10.1.4.3 Dynamization with animations 2040
10.1.4.4 Dynamize with system functions 2049
10.1.5 Working with function keys 2051
10.1.5.1 Working with function keys 2051
10.1.5.2 Assigning function keys globally 2053
10.1.5.3 Local assignment of function keys 2055
10.1.5.4 Assigning a function key to a function 2057
10.1.5.5 Assigning operator authorization for a function key 2058
10.1.5.6 Assigning a function key to a graphic 2060
10.1.5.7 Example: Using function keys for screen navigation 2062
10.1.6 Working with layers 2064
10.1.6.1 Basics on working with layers 2064
10.1.6.2 Moving objects between layers 2065
10.1.6.3 Setting the active layer 2066
10.1.6.4 Show and hide layers 2067
10.1.6.5 Renaming layers 2068
10.1.7 Working with libraries 2070
10.1.7.1 Basics on libraries 2070
10.1.7.2 Copy templates and types 2072
10.1.7.3 Libraries in WinCC 2072
10.1.7.4 Displaying library objects 2075
10.1.7.5 Managing library objects 2077
10.1.7.6 Storing an object in a library 2078
10.1.7.7 Inserting a library object 2079
10.1.7.8 Creating a global library 2080
10.1.7.9 Saving a global library 2081
10.1.7.10 Opening a global library 2082
10.1.8 Display and operating objects 2083
10.1.8.1 Device-Specific Nature of the Objects 2083
10.1.8.2 Objects 2084
10.1.9 Configuring screen navigation 2111
10.1.9.1 Basics for screen navigation 2111
10.1.9.2 Assign button with screen change 2112
10.1.9.3 Assign screen change to function key 2114

10.2 Working with Tags 2115
10.2.1 Basics 2115
10.2.1.1 Basics of tags 2115
10.2.1.2 Overview of HMI tag tables 2116
10.2.1.3 External tags 2117
10.2.1.4 Addressing external tags 2118
10.2.1.5 Internal tags 2121
10.2.2 Working with tags 2122
10.2.2.1 Creating tags 2122
10.2.2.2 Editing tags 2127
10.2.2.3 Configuring tags 2132
10.2.3 Working with arrays 2150
10.2.3.1 Basics on arrays 2150
10.2.3.2 Creating array tags 2152
10.2.3.3 Examples of arrays 2153
10.2.4 Working with cycles 2154
10.2.4.1 Cycle basics 2154
10.2.5 Displaying tags 2155

10.2.5.1 Outputting tag values in screens....2155
10.2.5.2 Configuring trend displays for values from the PLC 2155

10.3 Working with alarms....2158
10.3.1 Basics....2158
10.3.1.1 Alarm system in WinCC 2158
10.3.1.2 Alarm types 2159
10.3.1.3 Alarm states 2161
10.3.1.4 Alarm classes....2162
10.3.1.5 Acknowledgment....2164
10.3.1.6 Alarm groups....2165
10.3.1.7 Alarm number....2166
10.3.2 Working with alarms....2167
10.3.2.1 Alarm components and properties....2167
10.3.2.2 Configuring alarms 2168
10.3.2.3 Configuring alarm output....2182
10.3.2.4 Acknowledging alarms 2187
10.3.3 Operating alarms in Runtime 2190
10.3.3.1 Alarms in Runtime....2190
10.3.3.2 Simple alarm view, simple alarm window in runtime 2192
10.3.3.3 Alarm indicator in Runtime....2194
10.3.3.4 Acknowledging alarms 2194
10.3.4 Reference....2195
10.3.4.1 System functions for alarms....2195
10.3.4.2 System events....2196

10.4 Working with recipes 2219
10.4.1 Basics....2219
10.4.1.1 Definition and applications 2219
10.4.1.2 Examples for using recipes....2221
10.4.1.3 Structure of recipes 2221
10.4.1.4 Displaying recipes 2223
10.4.1.5 Flow of data for recipes....2223
10.4.1.6 Synchronization of recipe data records with the PLC 2224
10.4.2 Elements and basic settings 2225
10.4.2.1 "Recipes" editor....2225
10.4.3 Displaying and editing recipes in Runtime....2228
10.4.3.1 Simple recipe view 2228
10.4.3.2 Behavior of the recipe view in Runtime 2229
10.4.4 Configuring recipes 2231
10.4.4.1 General configuration procedure 2231
10.4.4.2 Creating and Editing Recipes 2232
10.4.4.3 Configuring the display of recipes....2239
10.4.5 Using recipes in Runtime 2242
10.4.5.1 Using the simple recipe view 2242
10.4.6 Example 2248
10.4.6.1 Example of creating a recipe 2248

10.5 Configuring user administration 2251
10.5.1 Field of application of the user administration 2251
10.5.2 Form of the user administration 2252
10.5.3 Basics....2253
10.5.3.1 Users....2253
10.5.3.2 Users work area....2253

10.5.3.3 User groups 2254
10.5.3.4 User groups work area 2255
10.5.3.5 Settings for the user administration 2256
10.5.4 Setting up the user administration 2258
10.5.4.1 Basics on user administration 2258
10.5.4.2 Administering users for Runtime 2258
10.5.4.3 Managing users in Runtime 2265
10.5.4.4 Configuring access protection 2273
10.5.5 Reference 2274
10.5.5.1 Objects with access protection 2274
10.5.5.2 Default user groups and authorizations 2274
10.5.6 Examples 2275
10.5.6.1 Example: Configuring a button with logon dialog box 2275
10.5.6.2 Example: Logging the logon and logoff events 2276
10.5.6.3 Example of user management 2277

10.6 Working with system functions 2285
10.6.1 Basics 2285
10.6.1.1 System functions 2285
10.6.1.2 Use of system functions 2286
10.6.2 Working with function lists 2287
10.6.2.1 Basic of the functions list 2287
10.6.2.2 Properties of a function list 2288
10.6.2.3 Configuring a function list 2288
10.6.2.4 Editing a function list 2290
10.6.2.5 Executing a function list in Runtime 2291
10.6.3 Example 2291
10.6.3.1 Changing the operating mode on the HMI device with the current display 2291
10.6.4 Reference 2294
10.6.4.1 Function list 2294
10.6.4.2 Events 2354

10.7 Planning tasks 2373
10.7.1 Field of application of the Scheduler 2373
10.7.2 Working with tasks and triggers 2374
10.7.3 Basics 2375
10.7.3.1 Work area of the "Scheduler" editor 2375
10.7.3.2 Function list 2376
10.7.3.3 Triggers 2377
10.7.3.4 Planning tasks with event triggers 2377
10.7.4 Examples 2379
10.7.4.1 Example: Update user following change of user 2379

10.8 Communicating with PLCs 2381
10.8.1 Basics of communication 2381
10.8.1.1 Communication between devices 2381
10.8.1.2 Devices and networks in the automation system 2382
10.8.1.3 Data exchange using tags 2385
10.8.1.4 Data exchange using area pointers 2386
10.8.1.5 Communication drivers 2386
10.8.2 Networks and connections 2387
10.8.2.1 SIMATIC communication networks 2387
10.8.2.2 Configuring networks and connections 2391
10.8.3 Data exchange 2399

10.8.3.1 Data exchange using tags 2399
10.8.3.2 Data exchange using area pointers 2406
10.8.4 Device dependency 2413
10.8.4.1 Basic Panel 2413
10.8.5 Communicating with SIMATIC S7 1200 2417
10.8.5.1 Communication with SIMATIC S7 1200 2417
10.8.5.2 Communication via PROFINET 2418
10.8.5.3 Communication via PROFIBUS 2432
10.8.5.4 Data exchange 2441
10.8.5.5 Performance features of communication 2460
10.8.5.6 Creating connections in the "Connections" editor 2461
10.8.6 Communicating with SIMATIC S7 300/400 2470
10.8.6.1 Communication with SIMATIC S7 300/400 2470
10.8.6.2 Communication via PROFINET 2471
10.8.6.3 Communication via PROFIBUS 2484
10.8.6.4 Communication via MPI 2492
10.8.6.5 Data exchange 2502
10.8.6.6 Performance features of communication 2519
10.8.6.7 Creating connections in the "Connections" editor 2520
10.8.7 Communicating with SIMATIC S7 200 2532
10.8.7.1 Communication with SIMATIC S7 200 2532
10.8.7.2 Creating a connection to SIMATIC S7 200 2532
10.8.7.3 Parameters for the connection 2534
10.8.7.4 Data exchange 2542
10.8.7.5 Performance features of communication 2560
10.8.8 Communication with other PLCs 2561
10.8.8.1 Communication with other PLCs 2561
10.8.8.2 Distinctive features when configuring 2562
10.8.8.3 Communication drivers 2562
10.8.8.4 Data exchange using area pointers 2676

10.9 Using global functions 2692
10.9.1 HMI device wizard basics 2692
10.9.2 Importing and exporting project data 2693
10.9.2.1 Importing and exporting project data 2693
10.9.2.2 Importing and exporting recipes 2694
10.9.2.3 Importing and exporting alarms 2698
10.9.2.4 Importing and exporting tags 2706
10.9.2.5 Importing and exporting text lists 2711
10.9.2.6 Importing and exporting project texts 2716
10.9.3 Using cross-references 2719
10.9.3.1 General information about cross references 2719
10.9.3.2 Displaying the cross-reference list 2719
10.9.3.3 Structure of the cross-reference list 2720
10.9.3.4 Displaying cross-references in the Inspector window 2721
10.9.4 Managing languages 2723
10.9.4.1 Languages in WinCC 2723
10.9.4.2 Language settings in the operating system 2724
10.9.4.3 Operating system settings for Asian languages 2725
10.9.4.4 Setting project languages 2726
10.9.4.5 Creating one project in multiple languages 2729
10.9.4.6 Using language-specific graphics 2737
10.9.4.7 Languages in runtime 2741

10.9.4.8 Example of multilingual configuration 2748
10.9.5 Replacing devices 2751
10.9.5.1 Basics 2751
10.9.5.2 Device-specific functions 2752
10.9.5.3 Adjusting screens to the new device 2755
10.9.6 Copying between devices and editors 2759
10.9.6.1 Basics 2759
10.9.6.2 Copying and pasting 2761

10.10 Compiling and loading 2766
10.10.1 Compiling and loading projects 2766
10.10.1.1 Overview of compiling and loading projects 2766
10.10.1.2 Compiling a project 2767
10.10.1.3 Loading projects 2768
10.10.1.4 Runtime start 2771
10.10.2 Simulating projects 2772
10.10.2.1 Simulation basics 2772
10.10.2.2 Simulating a project 2773
10.10.2.3 Working with the tag simulator 2775
10.10.3 Servicing the HMI device 2777
10.10.3.1 ProSave 2777
10.10.3.2 Backup of HMI data 2778
10.10.3.3 Backing up and restoring data of the HMI device 2779
10.10.3.4 Updating the operating system 2780
10.10.3.5 Updating the HMI device operating system 2781
10.10.4 Reference 2782
10.10.4.1 Error messages during loading of projects 2782
10.10.4.2 Adapting the project for another HMI device 2784
10.10.4.3 Establishing a connection to the HMI device 2785

10.11 Operating in Runtime 2787
10.11.1 Basics 2787
10.11.1.1 Overview 2787
10.11.1.2 Tags in Runtime 2788
10.11.1.3 System functions in Runtime 2788
10.11.2 Commissioning projects 2789
10.11.2.1 Settings in the Runtime software 2789
10.11.2.2 Loading projects 2790
10.11.2.3 Starting Runtime on the Engineering Station 2791
10.11.2.4 Starting Runtime on the HMI device 2792
10.11.2.5 Testing a project 2792
10.11.2.6 Closing a project 2793
10.11.2.7 Backing up and restoring data of the HMI device 2794
10.11.3 Languages in runtime 2795
10.11.3.1 Languages in runtime 2795
10.11.3.2 Setting a runtime language 2795
10.11.3.3 Setting the font for a runtime language 2797
10.11.3.4 Configuring language switching 2798
10.11.3.5 Specific features of Asian and Eastern languages in runtime 2798
10.11.4 Operating projects 2799
10.11.4.1 Basics 2799
10.11.4.2 Operating objects 2808
10.11.4.3 Project security 2821

10.11.4.4 Operating alarms 2829
10.11.4.5 Operating recipes....................2837

10.12 Performance features 2848
10.12.1 Engineering system 2848
10.12.2 Basic Panel 2850
10.12.3 General technical data 2854
10.12.3.1 Recommended printers 2854
10.12.3.2 Memory requirements of recipes for Basic Panels 2854

10.13 Migration to WinCC V11 2856
10.13.1 Overview of migration to WinCC V11 2856
10.13.2 Libraries 2856
10.13.3 Screens and templates 2858

11 Using technology functions.................... 2861

11.1 PID control 2861
11.1.1 Principles for control 2861
11.1.1.1 Controlled system and actuators 2861
11.1.1.2 Controlled systems 2863
11.1.1.3 Characteristic values of the control section 2865
11.1.1.4 Pulse controller 2868
11.1.1.5 Response to setpoint changes and disturbances 2871
11.1.1.6 Control Response at Different Feedback Structures 2872
11.1.1.7 Selection of the controller structure for specified controlled systems....................2879
11.1.1.8 PID parameter settings 2880

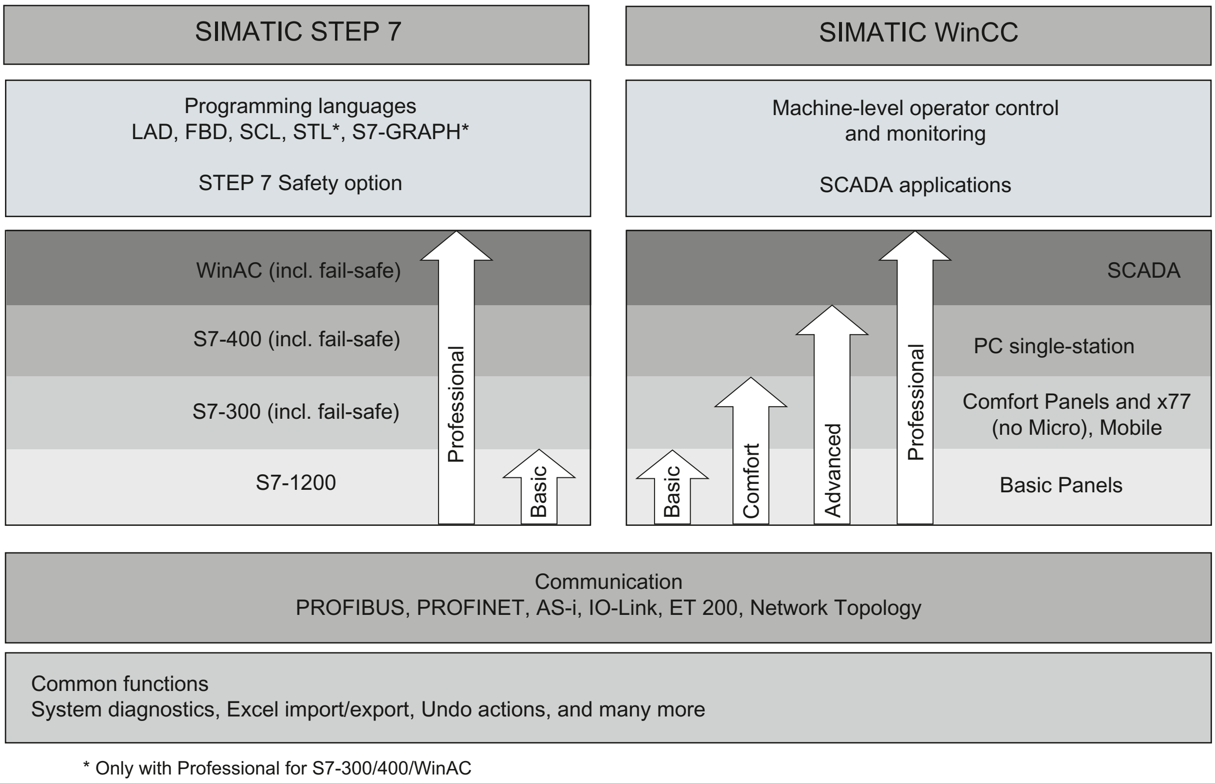
System overview of STEP 7 and WinCC 1

1.1 Scaling of STEP 7 and WinCC

Scope of performance of the products

The following graphic shows the scope of performance of the individual products of STEP 7 and WinCC:



STEP 7

STEP 7 (TIA Portal) is the engineering software for configuring the SIMATIC S7-1200, S7-300/400, and WinAC controller families. STEP 7 (TIA Portal) is available in 2 editions, depending on the configurable controller families:

- STEP 7 Basic for configuring the S7-1200
- STEP 7 Professional for configuring S7-1200, S7-300/400, and WinAC

WinCC

WinCC (TIA Portal) is an engineering software for configuring SIMATIC Panels, SIMATIC Industrial PCs, and Standard PCs with the WinCC Runtime Advanced or the SCADA System WinCC Runtime Professional visualization software.

WinCC (TIA Portal) is available in 4 editions, depending on the configurable operator control systems:

- WinCC Basic for configuring Basic Panels

  WinCC Basic is included with every STEP 7 Basic and STEP 7 Professional product.
- WinCC Comfort for configuring all panels (including Comfort Panels, Mobile Panels)
- WinCC Advanced for configuring all panels and PCs with the WinCC Runtime Advanced visualization software

  WinCC Runtime Advanced is a visualization software for PC-based single-station systems. WinCC Runtime Advanced can be purchased with licenses for 128, 512, 2k, 4k as well as 8k PowerTags (tags with a process interface).
- WinCC Professional for configuring panels and PCs with WinCC Runtime Advanced or SCADA System WinCC Runtime Professional

  WinCC Runtime Professional is a SCADA system for structuring a configuration ranging from single-station systems to multi-station systems including standard clients or web clients. WinCC Runtime Professional can be purchased with licenses for 128, 512, 2k, 4k, 8k, 64k, 102400, 153600 as well as 262144 PowerTags (tags with a process interface).

With WinCC (TIA Portal), it is also possible to configure a SINUMERIK PC with WinCC Runtime Advanced or WinCC Runtime Professional and HMI devices with SINUMERIK HMI Pro sl RT or SINUMERIK Operate WinCC RT Basic.

1.2 Options for STEP 7 Engineering System

Additional STEP 7 products

For applications with increased safety requirements, STEP 7 Professional can be extended with the STEP 7 Safety option.

The STEP 7 Safety option allows you to configure fail-safe PLC programs for F-CPUs.

1.3 Options for WinCC Engineering and Runtime systems

SIMATIC Panels as well as WinCC Runtime Advanced and WinCC Runtime Professional contain all essential functions for operator control and monitoring of machines or plants. Additional options allow you to extend the functionality in some cases to increase the range of available tasks.

Options for Comfort Panels, Mobile Panels, Multi Panels

The following possible extensions are available for Comfort Panels, Mobile Panels, and Multi Panels:

- WinCC SmartServer (remote operation)
- WinCC Audit (audit trail and electronic signature for regulated applications)

Note

In contrast to WinCC flexible 2008, functions from the WinCC flexible /Sm@rtService, WinCC flexible /Sm@rtAccess options as well as the WinCC flexible /OPC Server option are incorporated into the basic functionality.

Options for WinCC Runtime Advanced

The following possible extensions are available for WinCC Runtime Advanced:

- WinCC SmartServer (remote operation)
- WinCC Recipes (recipe system)
- WinCC Logging (logging of process values and alarms)
- WinCC Audit (audit trail for regulated applications)

Note

In contrast to WinCC flexible 2008, functions from the WinCC flexible /Sm@rtService, WinCC flexible /Sm@rtAccess options as well as the WinCC flexible /OPC Server option are incorporated into the basic functionality.

Options for WinCC Runtime Professional

The following possible extensions are available for WinCC Runtime Professional:

- WinCC Client (standard client for structuring multi-station systems)
- WinCC Server (supplements WinCC Runtime to include server functionality)
- WinCC Recipes (recipe system, formerly WinCC /UserArchives)
- WinCC WebNavigator (Web-based operator control and monitoring)
- WinCC DataMonitor (display and evaluation of process states and historical data)

Note

In contrast to WinCC V7, functions from the WinCC /OPC-Server and WinCC /ConnectivityPack options are incorporated into the basic functionality. Likewise, the basic functionality includes the Runtime API from WinCC /ODK.

Beyond the Runtime options, WinCC Runtime Advanced and WinCC Runtime Professional can be extended through customer-specific controls. To develop controls, the WinCC ControlDevelopment option is required.

Readme 2

2.1 General notes

2.1.1 General notes

The information in this readme file supersedes statements made in other documents.

Read the following notes carefully because they include important information for installation and use. Read these notes prior to installation.

Security settings

In order to operate the software packages in the TIA Portal, port 4410 for TCP must be entered as an exception in the Windows firewall during installation.

Installing new .Net versions or .Net service packs

- Close the TIA portal before installing a new .Net version or a new .Net service pack on your programming device/PC.
- Restart the TIA portal only after successful installation of the new .Net version or the new .Net service pack.

Notes on handling

- If a project in the list of projects last used is located on a network drive that is not connected, you may experience delays when opening the "Project" menu.
- When you insert a CPU, you may need to wait for some time if the project editor is open at the same time. This generally takes longer when you insert the first CPU in a newly created project. To be able to continue working more quickly, you should close the project editor before inserting a CPU.
- The message "Application is not responding" may appear in Windows 7 with functions that take a long time to run (loading the CPU for example). If this occurs, wait until the function has correctly finished.
- If you have installed a Microsoft mouse with IntelliPoint, you may find that it superimposes components over the buttons of the title bar. If this is the case, uninstall the IntelliPoint software from Microsoft.
- Enabling the "Virtual Desktop" options with NVIDIA graphics cards can cause problems. In this case, disable the "nView virtual desktop manager" of your NVIDIA graphics driver.

Using the TIA Portal via a remote desktop

In principle, it is possible to use the TIA Portal via a remote desktop connection. During configuration, you should, however, avoid disconnecting the connection to the desktop client. In rare cases, this can lead to the software user interface being blocked.

If you experience this blockage, follow these steps on the desktop client.

1. Open the Windows Task-Manager and close the "rdpclip.exe" process.
2. Type in "rdpclip.exe" in the command prompt to restart the process.

Note that the current content of the clipboard will be lost. You can, however, then continue configuration as usual. To be on the safe side, you should restart the TIA Portal at the next opportunity.

Opening the TIA portal multiple times

If you are running several applications of the TIA portal and they continually become active in turn, you can briefly switch to another application or use the key combination <ALT+Tab> to solve the problem.

Note on SD cards

The SD cards have been formatted and initialized by Siemens for use with S7-1200 modules. This format must not be overwritten otherwise the card will no longer be accepted by the S7-1200 modules. Formatting with Windows tools is therefore not permitted.

Behavior in case of open force job

Note that active force jobs will be retained even after you have loaded a new project to the SD card. This means you should first delete the active force job before you remove an SD card from the CPU and before you overwrite the card in the PC with a new project. If you use an SD card with unknown content, you should format the SD card before the next download.

Issues when shutting down Windows XP or when activating a screen saver

Windows XP uses the ACPI (Advanced Configuration and Power Interface) to shut down the computer or to go to standby mode. It can happen that while the system is processing a newly installed tool that the screen saver is not activated by the ACPI or that after exiting the tool that Windows XP cannot be shut down properly.

If the TIA Portal is running, the Standby function of the computer is deactivated. To put the computer into Standby, you have to first exit the TIA Portal.

The following description shows several optional settings in the "Power Options Properties" you can use to set the Standby mode of the computer with the function "Hibernate":

1. In Windows XP, open the "Power Options Properties" by pointing at "Start > Settings > Control Panel > Power Options" and select the tab "Hibernate". Select the "Enable hibernation" check box.
2. Switch to the "Advanced" tab. In the "Power buttons" dialog, click the drop down list box under "When I close the lid of my portable computer:" and select the option "Hibernate".
3. Then click the drop-down list box under"When I press the power button on my computer:" and select the option "Shut down".

4. Click "Apply" and confirm the settings with "OK".
5. Afterwards, restart the PC.

If you experience problems shutting down the computer, make sure that the TIA Portal has closed completely.

1. In the shortcut menu, select the Task Manager from the shortcut menu on the Taskbar.
2. If you see the process "Siemens.Automation.ObjectFrame.FileStorage.Server.exe" in the "Processes" tab, wait until this process has closed.
3. Then you can shut down the computer.

Subnet addressing for CP 1613 and CP 1623

CP 1613 and CP 1623 are communication modules with microprocessor. To ensure secure management of communication links, these are processed on the module. The protocol stack in your PC is used for diagnostic purposes (SNMP, DCP). To allow both protocol stacks (i.e. CP 1613/23 Firmware and CP 1613/23 NDIS access) access to the same partners, is recommended to place both stacks of a module in the same subnet.

Editing a device IP address

Do not use the address range from 192.168.x.241 to 192.168.x.250 when editing a device IP address. If necessary, this address range is automatically assigned by the system to a programming device. Depending on the subnet mask, this applies also for all network classes.

"TM_MAIL" instruction for TeleService

The "TM_MAIL" instruction is not included in the scope of delivery for TIA portal V11.0. The information on the use and functionality of the "TM_MAIL" instruction contained in the information system does not apply.

Migrating projects with the TIA Portal

After the migration of hardware configurations and program blocks from earlier automation solutions, first check the functionality of the migrated project before you use it in productive operation.

Screen display

After long periods of work, it can happen in the case of certain computer configurations with Windows XP that parts of the TIA Portal interface are no longer updated. Reducing the graphic hardware acceleration can correct this problem. You can find the setting for this by clicking on the desktop and selecting "Properties > Settings > Advanced > Troubleshoot > Slider Hardware acceleration" by means of the right mouse button. In this dialog, move the slider "Hardware acceleration" gradually to the left and apply this setting until the contents of the screen are displayed correctly again.

Tablet PCs

For the TIA Portal V11, tablet PCs are only released with the operating system Windows 7, not with Windows XP.

SQL Server

During the installation of the SQL Server 2005 or the SQL Server 2005 Express, an error can occur if the product SQL Server 2008 is already installed on your system.

In order to be able to use both varieties of the SQL Server in parallel, the SQL Server 2005 must be installed before the SQL Server 2008. To do this, follow these steps:

1. Remove the SQL Server 2008 version, without deleting the databases.
2. Install WinCC. The SQL Server 2005 is hereby installed and set up on your system.
3. Install the SQL Server 2008 again. Now you can continue to use the databases already created in the SQL Server 2008.

Working with automatically synchronized network drives

Automatic synchronization after a network interruption can result in current (local) project data being stored as a "backup" on the network drive through user interactions. This could cause outdated project data to be loaded from the network drive when opening the project. For this reason, we do not recommend that you store TIA Portal projects on synchronized network drives.

If, however, you do work on synchronized drives, you can continue working locally in the event of a network interruption. In this case, you must always ensure that the TIA Portal application is closed while data is synchronized. The synchronization itself must be implemented in such a way that the current (local) project data replaces the project data on the network drive.

Entry of decimal places

With certain Windows language settings, it may occur that the entry of values with a comma is not recognised (entering "1,23" leads to an error). Instead, use the international format ("1.23").

FAQs on the TIA Portal

FAQs on the TIA Portal are available at http://support.automation.siemens.com (http://support.automation.siemens.com/WW/view/en/28919804/133000).

2.1.2 Notes on the installation

Contents

Information that could not be included in the online help.

Target directory of the installation

Do not use any UNICODE characters (for example, Chinese characters) in the installation path.

Installation of STEP 7 Basic V11 and STEP 7 Professional V11 under Windows XP with Turkish Regional and Language Options

Installation of STEP 7 Basic V11 and STEP 7 Professional V11 under Windows XP may be cancelled, if the regional and language options are set to Turkish. In this case change the regional and language options from Turkish to English or German.

1. Open the Control Panel under Windows with one of the following commands:
   - "Start > Control Panel" (Start menu under Windows XP)
   - "Start > Settings > Control Panel" (classic start menu)
2. Open the "Regional and Language Options".
3. Select the "Regional Options" tab.
4. Under "Standards and formats" select "German" or "English" in the drop-down list.
5. Click "Apply" and confirm with OK.
6. Restart your PC for the setting to become active. Now you can continue with the installation of STEP 7 Basic V11 and STEP 7 Professional V11.
7. After installation, you can revert the regional and language settings (as described in steps 1 to 4) to Turkish.

Removing

In rare cases removal of the program can cause the computer to freeze, even when a full version of SQL Server 2005 is installed. In this occurs, disconnect the computer from the network to continue the removal process.

Installation of the SIMATIC USB driver under Windows server 2003 R2 StdE SP2

An operating system message relating to the SIMATIC USB driver is issued on the operating system Windows Server 2003 R2 StdE SP2. This message must be acknowledged with "Yes" as soon as possible after the message has been issued. The message may be in the background and therefore may not be immediately visible. After a certain period of time, the setup continues with the next component. The SIMATIC USB drivers are then not installed and cannot be used.

Display of the desktop icon

If you do not select the standard installation path during the installation of the TIA portal, the desktop icon may not be displayed correctly. This does not affect the functionality of the product.

2.1.3 Use of communications processors

Contents

Information that could not be included in the online help.

Necessary hotfixes for the use of certain communications processors

For the following communication processors, hotfixes are required for the use of certain products:

- CP 1613
- CP 1613 A2
- CP 1623
- CP 5613
- CP 5614
- CP 5613 A2
- CP 5614 A2
- CP 5623
- CP 5624

Install the following hotfixes and service packs:

- SIMATIC NET CD V8.0 SP1 for Windows 7: Hotfix 1 for SIMATIC NET CD V8.0 SP1
- SIMATIC NET CD 2008 SP3 for Windows XP, Windows Server 2003 or Windows Server 2008

You can find the hotfixes in the Service & Support area (http://support.automation.siemens.com/WW/view/en/12660737) of the Siemens website under the entry ID 12660737

Operation of communications processors

If both STEP7 V5.5 and STEP7 V11 are installed on a computer and STEP7 V5.5 is removed, the setup repair function of STEP7 V11 must be executed before the following communications processors can be used:

- CP 561x
- CP 5613 A2
- CP 5614 A2
- CP 5623
- CP 5624
- CP 5711

2.2 STEP 7 Basic

2.2.1 Notes on use

Contents

Information that could not be included in the online help.

Online operation

The simultaneous online operation of STEP 7 V5.5 or earlier and STEP 7 Basic V11 has not been approved.

Simultaneous online connections on an S7-1200 CPU

It is not possible to establish an online connection from multiple TIA portal instances simultaneously to the same S7-1200 CPU.

Configuring and assigning module parameters

For an overview of the modules you can configure and assign with STEP 7 Basic V11 go to http://support.automation.siemens.com (http://support.automation.siemens.com/WW/view/en/28919804/133000).

Removing/inserting the memory card

After removing or inserting a memory card, always perform a memory reset on the CPU in order to restore the CPU to a functional condition.

Removing and inserting Ethernet modules

If Ethernet modules are removed and re-inserted during operation, you must boot the PC; otherwise, the "Accessible devices" functionality in STEP 7 or NCM PC will not display all devices. While the PC boots, Ethernet modules must be activated.

Notes on the information system

The following function is already described in the information system, but is not available in STEP 7 Basic V11.0 SP1:

- Loading hardware configurations from the target system to the PG/PC.

2.2.2 Editing devices and networks

2.2.2.1 General information on devices and networks

Contents

Currently, there is no general information available on devices and networks.

2.2.2.2 System reaction of the S7-1200 CPU with firmware version V2.0

Contents

Information that could not be included in the online help.

System reaction of the S7-1200 CPU with firmware version V2.0 to events without OB start

When a module of the distributed I/O (PROFINET or PROFIBUS) is removed or inserted, the CPU generates a diagnostic buffer entry and remains in RUN mode.

If a programming error or an I/O access error occurs in a block for which you do not have local error handling activated, then:

- The CPU generates a diagnostic buffer entry.
- Contrary to the description in the online help, the CPU remains in RUN mode.

2.2.2.3 Replacing the ET 200S pulse generator and positioning modules

Contents

Information that could not be included in the online help.

Replacing the ET 200S pulse generator and positioning modules

This information is relevant to the "2 Pulse" pulse generator modules (6ES7 138-4DD00-0AB0) and "1 Step 5V" positioning modules (6ES7 138-4DC00-0AB0) from a project which was created with TIA Portal V11.0. When replacing these modules from the TIA Portal V11.0 with a new version of these modules, the parameter settings are reset to the default values.

This is the case with one of the following procedures:

- Replacting the pulse generator module 6ES7 138-4DD00-0AB0 or the positioning module 6ES7 138-4DC00-0AB0 with their successor modules 6ES7 138-4DD01-0AB0 or 6ES7 138-4DC01-0AB0 by means of a device replacement.
- Updating the module version using the appropriate button in the device properties in the Inspector window.

2.2.2.4 Setting flow control for CM 1241 (RS232)

Contents

Information that could not be included in the online help.

Values for XON and XOFF

If flow control is enabled for the CM 1241 (RS-232) communications module and set to "XON/XOFF", you can enter identical values for the XON and XOFF characters. From a technical point of view, however, this configuration is impractical. You should therefore use different values for XON and XOFF.

2.2.2.5 Notes on online and diagnostics

Contents

Information that could not be included in the online help.

Hardware detection followed by online connection

When the "Online > Hardware detection" command is performed for an unspecified CPU, the online configuration is not loaded from the CPU. If you do not load the configuration resulting from the hardware detection to the CPU, the device and network views will always show a difference between the offline and online configurations. It will appear there are different configurations in the online and diagnostic views, although the MLFBs are identical in the actual CPU and the offline CPU.

Assigning an IP address

If an IP address is assigned directly to a PLC via the diagnostics and online function with "Functions > Assigning an IP address", this IP address will be set permanently and retained even after a restart or power failure.

2.2.2.6 Compiling the hardware of a pulse generator

Contents

Information that could not be included in the online help.

Compiling with a disabled pulse generator

If a pulse generator is deactivated and the following error message nevertheless appears during compilation of the hardware "Pulse generator as: PTO cannot be selected. Associated high speed counter not correctly configured.", follow these steps:

1. Deactivate the high-speed counter.
2. Activate the pulse generator and set the operating mode to "PTO".
3. Deactivate the pulse generator.
4. Recompile the hardware.

2.2.3 Programming a PLC

2.2.3.1 General notes on PLC programming

Contents

Information that could not be included in the online help.

Programming language SCL

For CPUs of the S7-1200 series, SCL is not yet available in STEP 7 V11.0. This functionality will be provided as part of a service pack as soon as possible.

Downloading inconsistent programs to a device

In TIA portal, it is not possible to download inconsistent programs to a device without a consistency check. During the loading process, all blocks of the program are implicitly checked and are compiled again in the event of inconsistencies. If, however, there are programs on your CPU which were loaded with earlier versions of STEP 7, these programs could demonstrate inconsistencies.

In this case, note the following:

If you load an inconsistent program from a device, you will not be able to load the program unchanged to the device afterwards, because a consistency check always takes place during the loading process and existing inconsistencies are corrected.

Copying overlaying tags

Tags that overlay other tags using the keyword "AT" cannot be copied. In this case, copy the overlaid tag and define the overlay again on the copy.

Process image of PTO/PWM outputs

Do not use PTO/PWM outputs in the process image (for example, for accesses in the user program, for online functions or in HMI). The update rate of the process image is much slower than the rate of the signal changes. The display in the process image does not reflect the signal flow.

Conversion of know-how protected blocks from V10.5

After the conversion from V10.5 to V11.0, the program must be compiled. If you use know-how protected blocks, you are prompted to enter the password.

2.2.3.2 Instructions

Contents

Information that could not be included in the online help.

MODBUS library

The instruction "MB_SLAVE" was updated in STEP 7 V10.5 SP2.

If you have already used "MB_SLAVE" V1.0 in a project that was created with STEP 7 V10.5 SP1, you must manually replace this version with the new version MB_SLAVE" V1.1 after the installation of STEP 7 V11.

To do this, follow these steps:

1. Delete "MB_SLAVE" V1.0 from all blocks in the project.
2. Delete "MB_SLAVE" V1.0 from the project library.
3. Insert "MB_SLAVE" V1.1 in all required locations of use.
4. Compile the project.

Using instructions with parameters of type VARIANT in logic blocks with different access types (S7-1200)

Logic blocks (FBs/FCs) and data blocks (DBs) can be created with different access types ("standard" and "optimized"). In logic blocks, you can call any instructions. Certain instructions (for example, "WRIT_DBL" and "READ_DBL") use pointers of type VARIANT at input and output parameters to address data blocks.

Ensure that you do not use these instructions in programs in which logic blocks of different access types are called reciprocally. This could cause the following to occur:

- A structure from a standard data block is directly or indirectly passed to an optimized logic block, which forwards this structure directly or indirectly to one of the blocks mentioned above.
- The reverse scenario, whereby a structure from an optimized logic block is directly or indirectly passed to a standard data block, which forwards this structure directly or indirectly to one of the blocks mentioned above.

2.2.3.3 Testing the user program

Testing with the watch table

Contents

Information that could not be included in the online help.

Multiple access to the same CPU

Access to a CPU from a PG/PC is permitted only when a TIA portal is open. Multiple access to the same CPU is not permitted and can lead to errors.

Modify with trigger

When modifying with a trigger, for example when permanently modifying a tag, an existing control job is aborted if the CPU memory is currently being reset (MRES). The control job is also terminated even if you answer "no" to the prompt asking whether to stop modifying with trigger in the watch table dialog.

Rounding floating-point numbers

In the watch table, floating-point numbers are stored as binary numbers in IEEE format. Since some floating-point numbers (real, long real) that can be displayed in the user interface cannot be mapped exactly to the IEEE format, it is possible that floating-point numbers will be rounded.

If a floating-point number has been rounded for this reason and it is then copied to another input cell in the watch table, the rounding may result in a slight deviation.

Loading data blocks during an active control job

NOTICE
Loading changed data blocks during an active control job can result in unforeseen operating states. The control job continues to control the specified address, although the address allocation may have changed in the data block. Complete active control jobs before loading data blocks.

Testing programs converted from STEP 7 V10.5.

To monitor and test a program converted from STEP 7 V10.5, you have to first compile and load with STEP 7 V11.0.

2.2.4 Technology functions

2.2.4.1 Notes on technology functions (S7-1200)

S7-1200 technology functions

There are no notes available on the S7-1200 technology functions.

2.3 WinCC Readme

2.3.1 Notes on use

Contents

Information that could not be included in the online help.

Parallel installation in the TIA portal

You will be prevented from starting the TIA portal if you set up a non-permitted parallel installation of STEP 7 and WinCC.

The following parallel installations are not permitted in the TIA portal:

- STEP 7 V11 and WinCC V11 SP1
- STEP 7 V11 SP1 and WinCC V11

Both Engineering Systems must always have the same version after an installation.

A dialog opens during installation to inform you of any inconsistencies in your parallel installation.

Copying HMI devices with HMI connections

If you copy an HMI device with HMI connections to a PLC, the HMI connection in the new HMI device will not automatically be connected to an existing PLC with the same name. This statement applies to copying within a project as well as copying across projects.

To access the PLC tag via HMI tag in the new HMI device, you will have to complete the HMI configuration immediately after the copying step. Proceed as follows:

1. Open the "Devices & Networks" editor.
2. Connect the new HMI device with the desired network.
3. Open the connection table.
4. Select the HMI connection of the new HMI device.
5. Select the desired PLC under "Partner".

If you compile the new HMI device or connect additional PLC tags in between copying the HMI device and completing the connection, there may be some instances in which you create an additional HMI connection to the same PLC. This is especially true if you connect HMI tags with DB array elements.

Device replacement

After an HMI device has been replaced, you should check the appearance of the configured screens. Changing the size of the display may result in changes to the position and appearance of screen objects, e.g. recipe view and alarm view.

Device replacement - communication

If an HMI device is replaced, error messages of the type "... will not be supported in the new configuration. It will be removed" will be issued. These alarms refer to configured connections of the device and are triggered, for example, if the HMI devices have a different number of interfaces. These connections are marked red after a device replacement. If you would like to continue to use these connections, you have change the configuration of the connection. Proceed as follows:

1. Open the "Devices and Networks" editor.
2. Click "Network" in the toolbar of the network view.
3. Network the interface of the HMI device with the interface of the CPU.
4. Click in the tabular area of the network view on the "Connections" table.
5. Select the connection marked red.
6. Enter the new interface under "Properties > Properties > General > Interface" in the Inspector window.

Specifying the time of modification in the overview window

The times of modification displayed in the overview window only refer to changes to the object itself. Changes to subordinate objects, e.g. screen objects in a screen, do not cause the time of the last change to the screen to change in the overview window.

HMI device wizard

When you create a device with a color display using the HMI device wizard, the graphics of the navigation buttons may be displayed in black and white. This error only occurs, however, if the new device is created with the same name as a device with a monochrome display which has been deleted in the meantime.

You can avoid this error by always deleting the associated graphics in the Graphics collection whenever you delete a device from the project.

Objects with object references in the project library

Two copying methods can be used in WinCC flexible.

- With "simple copy" a WinCC flexible screen including an IO field, for example is copied. Only the object name of a tag configured on the IO field is copied, as this is a reference.
- With "copy", a screen, an IO field contained there and a tag configured on the IO field together with its properties are copied.

These two methods can also be used for storing an object in a library. Project libraries and the objects contained there are migrated during migration and can be used in WinCC.

In WinCC, however, only one copying method is available. With regard to tags, it functions like "simple copy" in WinCC flexible. With regard to graphics, graphics lists and text lists, it functions like "copy" in WinCC flexible.

If you stored objects with references to tags in a library in WinCC flexible, you must reconfigure the referenced objects when using them in WinCC.

Installing East Asian project languages on a PC without Asian operating system

If you select an East Asian project language on a PC that does not have an Asian operating system installed, the default font will be marked as invalid in the "Runtime settings > Language & font" editor.

To resolve this problem, open the "Regional and Language Options > Languages" dialog in the Control Panel and select the "Install files for East Asian languages" option.

Windows 7 and Windows 7 SP1

WinCC V11 SP1 is released for:

- Windows 7
- Windows 7 SP1

Parallel installation of WinCC V11 SP1 and WinCC V7.0

A parallel installation of WinCC V11 SP1 and WinCC V7 is not released for versions prior to WinCC V7 SP3.

2.3.2 Migration

Contents

Information that could not be included in the online help.

Changing the names of alarm classes

In contrast to WinCC flexible, the names of the predefined alarm classes are not dependent on the user interface language currently in use. During migration, the names of the alarm classes are assigned as follows:

WinCC flexible	WinCC
Error	Errors
System	System
Warnings	Warnings

The display names of the alarm classes can be changed as necessary after migration.

Project languages in WinCC

WinCC V11 does not support all project languages that were available in WinCC flexible, such as Arabic. If you receive an empty project as the result of your migration, you may want to check the set editing language. Do not set the project languages that are not supported as editing language in the source project. Proceed as follows:

1. Open the project with WinCC flexible.
2. Change the editing language to English, for example.
3. Save the project.
4. Restart the migration.

Objects with object references in the project library

Two copying methods can be used in WinCC flexible.

- With "simple copy", a WinCC flexible screen including an IO field, for example, is copied. Only the object name of a tag configured on the IO field is copied, as this is a reference.
- With "copy", a screen, an IO field contained there and a tag configured on the IO field together with its properties are copied.

These two methods can also be used for storing an object in a library. Project libraries and the objects contained there are migrated during migration and can be used in WinCC.

In WinCC, however, only one copying method is available. It functions like "simple copy" in WinCC flexible.

If you have stored objects with references to other objects in a library in WinCC flexible, you must reconfigure the referenced objects when using them in WinCC.

Structures with data type "Stringchar"

In WinCC V11, the data type "StringChar" is not supported in HMI user data types.

If you have used this data type in a structure in a WinCC flexible project, an invalid element is created by the migration in the HMI user data type.

You have to rework this user data type in WinCC. You can only remove the invalid element if you assign a valid data type and release the user data type. You can then delete the element. However, doing this causes any interconnections present between a faceplate and the elements of the user data type to be lost.

Also check the offsets of the subsequent elements and change them, if required.

Tag logging archives from WinCC V7

It is not possible to use the tag logging archives from WinCC V7 after migration to WinCC V11.

2.3.3 Engineering System

2.3.3.1 Screens and Screen Objects

Contents

Information that could not be included in the online help.

Text format of output fields in alarm text

It is not possible to underline tags and text list entries.

Copying display objects between two projects or two devices

In Project_1 configure an alarm window in the Global Screen, for example. You copy the alarm window and paste it in the Global Screen in Project_2.

The enabled alarm classes are partly not enabled in the alarm window after pasting.

This behavior applies to the following display objects:

- Alarm window
- Alarm indicator
- Alarm view

Representation of the cross-references in the Inspector window

The Inspector window displays objects used by a screen object in the "About > Cross-reference" tab.

A screen is open and an object selected. You are using an HMI tag at the object as process tag.

The object and the linked HMI tag are displayed in the cross-references. All locations of use of the object and the HMI tags are listed.

If the HMI tag is interconnected with a PLC tag or a DB tag, then the locations of use of the interconnected PLC tag or DB tag will be displayed.

Event names in case of alarms in the "Info" tab of the Inspector window

In some alarms of the Inspector window the event names in the "Info" tab will deviate from the names in the "Properties" tab.

Name in the "Properties" tab of the Inspector window	Name in the "Info" tab of the Inspector window
Cleared	ClearScreen
Loaded	GenerateScreen
Enable	Activate
Change	Change
When a dialog is opened	ONMODALBEGIN
When a dialog is closed	ONMODALEND
User change	PASSWORD
Screen change	SCREEN
Disable	Deactivate
Press	Press
Outgoing	Going
Incoming	Coming
Limit "high limit error" violated	AboveUpperLimit
Limit "low limit error" violated	BelowLowerLimit
Click	Click
Loop-In-Alarm	LoopInAlarm
Release	Release
Alarm buffer overflow	OVERFLOW
Acknowledge	Acknowledgement
Runtime stop	Shutdown
Press key	KeyDown
Release key	KeyUp
Switch ON	SwitchOn
Switch OFF	SwitchOff
Value change	Change value

Dynamization of object properties in a group

The dynamization of properties for all objects of the group which have these properties is not possible in a group. In WinCC V11, the properties of the objects beloning to a group can only be dynamized for each object itself.

Illegible characters in Runtime Professional

With Runtime Professional, only characters belonging to the language area which is defined with the operating system setting "Language for non-Unicode programs" can be displayed on the target system. Texts with characters from other language areas can, however, also be configured in the project.

Illegible characters may occur in the Engineering System with the objects text field, symbolic I/O field, gauge and slider if the settings in the operating system relating to "Language for non-Unicode programs" do not match the selected editing language and the objects are displayed in a different design than "WinCC Classic". The characters are displayed correctly in the Inspector window and the "Project texts" editor.

Therefore, first check in the Control Panel under "Regional and Language Options > Advanced" whether the setting for "Language for non-Unicode programs" is the same as the editing language. Otherwise, you can check or change the correct texts in the Inspector window or the "Project texts" editor.

Faceplates

Faceplates cannot be rotated or mirrored.

Persistence with display objects in WinCC Runtime Professional

The objects f(t)-trend view, f(x)-trend view, alarm view, recipe view, table view and value table have settings for the persistence of online configurations. If you have configured "Persistence" for "Online configuration" and "Keep changes" for "Reaction to screen change", you can make changes to the configuration dialogs in runtime which will be retained after a screen change and after runtime is exited.

However, online configurations for the settings mentioned cause changes to the configuration of the objects in the Engineering System to only be applied in Runtime if you recompile the device with the command "Compile > Software (rebuild all)".

Basic Panels, OP73, OP77A and TP177A: Displaying texts in runtime

The default font selected in the "Runtime settings > Languages & font" editor has an effect on the display of texts in runtime.

Text entries may be truncated if you selected an unfavorable font size or style.

This setting possibly has an effect on the following text entries:

- Tooltips
- long alarm text
- text in the dialogs

2.3.3.2 Tags

Contents

Information that could not be included in the online help.

Tag names

HMI tag names may not start with the character @.

Display of deleted array elements at location of use of HMI tags

The locations of use of HMI tags, such as the process value of IO fields, are usually indicated by the tag name. If the element of an array tag is used, then the tag name will be extended by the index of the array element indicated in brackets.

If a used tag is no longer included in the project, then the tag name will still be displayed at the location of use. The field will be displayed with a red background to indicate the missing tag. If a used array element or the array tag is no longer present, then only the index of the array element will be displayed in brackets. The tag name will not be displayed. The field is highlighted in red. You can no longer identify the name of the associated array tag based on the location of use in this instance.

If you do not know which array tag was linked to this location of use, then it may be necessary to link the array element once again.

If a tag or array tag was created based on a reference, then the selected reference will be closed automatically.

If an HMI tag is connected with an array element of a PLC tag and the PLC tag does no longer exist in the project, then the same behavior will take place in the "HMI tags" editor.

Array tags as list entry of multiplex tags

You can use the array tags of the Char data type just like the tags of the String data type.

The use of an array tag of the Char data type as list entry of a multiplex tag in the "HMI tags" editor is not supported.

2.3.3.3 Alarm system and alarm displays

Contents

Information that could not be included in the online help.

Displaying special characters in alarm texts

When configuring alarm texts, a fixed character set is used in the Engineering System. This character set allows you to use numerous special characters in alarm texts.

Language-dependent fonts are used in runtime to display the texts, for example MS PGothic, SimSun. The fonts used in runtime do not support all special characters. As a result, some special characters are not displayed in runtime.

Use of multiplex tags in output boxes with alarm texts

In the engineering system, it is also possible to use multiplex tags in the output boxes of alarm texts. During runtime, this leads to an incorrect display of the alarm, because the use of multiplex tags is not supported by the basic panels.

2.3.3.4 System functions

Contents

Information that could not be included in the online help.

2.3.3.5 Recipes

Contents

Information that could not be included in the online help.

2.3.3.6 User administration

Contents

Information that could not be included in the online help.

2.3.3.7 Communication

Contents

Information that could not be included in the online help.

Connection interruptions with Mitsubishi PLCs

After multiple connection interruptions, a situation may arise where all the connection resources of the Mitsubishi PLC are in use and the connection can no longer be established. It is recommended to check these connection resources in the PLC program of the PLC and also enable them again.

Using "DTL" data type for area pointers

Use the "DTL" data type for configuration of area pointers "Date/time" and "Date/time PLC". The "DTL" data type supports time information down to the nanosecond range. Because Basic Panels support time information only down to the millisecond range, you will encounter the following restrictions in the case of use on the area pointers:

- Area pointer "Date/time"
  For transmission of time information from a Basic Panel to the PLC, the smallest unit of time is 1 millisecond. The value range from microseconds to nanoseconds of the "DTL" data type will be filled with zeros.
- Area pointer "Date/time PLC"
  For transmission of time information from a PLC to a Basic Panel, the area from microseconds to nanoseconds will be ignored. The time information will be processed on the panel down to milliseconds.

Limited number of possible HMI connections

An error message is displayed during compilation of a device indicating that the configuration of the HMI connection in the "Devices & Networks" editor is invalid. The reason may be that the maximum number of possible connections of the HMI device or PLC has been exceeded.

Check the maximum number of available connections. Consult the device manuals of the devices you are using.

Routed communication with S7 300/400

The communication of connection partners in various subnets can be routed via the following links: PROFINET, PROFIBUS, MPI.

Using PROFINET IO with panel HMI devices

When using PROFINET IO to connect the direct keys and LEDs of HMI devices to the PLC, you can define an offset for the address area of the inputs and outputs during configuration in HW Config.

The following restriction applies when you use a PROFINET IO-capable CPU of the 400 series with one of the HMI devices listed below:

The offset for the start of the address area of the inputs must not be bigger than the offset for the start of the address area of the outputs.

The restriction applies to the following HMI devices:

- OP 177B
- OP 277
- Mobile Panel 177

For the configuration of the address parameters, open the PLC with the CPU of the 400 series in HW Config. Select the HMI device connected via PROFINET IO in the station window of HW Config. A table with the properties of the HMI device is displayed at the bottom of the station window in the detail view. Select the line containing the addresses of the HMI device in the table and open the object properties using the shortcut menu.

Select the "Addresses" tab in the "Object properties" dialog. Configure the offset for the inputs under "Inputs > Start". Configure the offset for the outputs under "Outputs > Start".

Exceeding value ranges with Mitsubishi MC and Mitsubishi FX

With some data types, the communication drivers Mitsubishi MC and Mitsubishi FX do not check whether the value of a recipe tag exceeds the value range of the PLC tags. The data types affected are:

- 4-bit block
- 12-bit block
- 20-bit block
- 24-bit block
- 28-bit block

Area pointer Coordination in an OPC connection

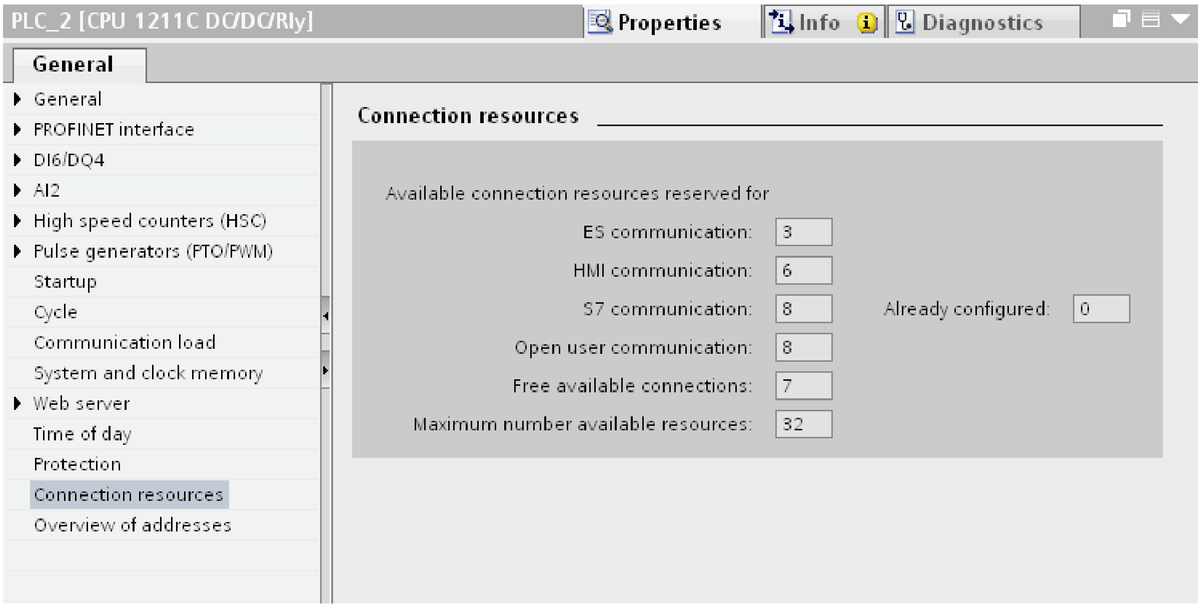
In principle, the area pointer Coordination can be used eight times in an OPC connection. If you have configured an OPC connection and automatically create another OPC connection using "Add", the area pointer Coordination is only displayed once in the newly created connection. In this case, you should change the communication driver of the connection. If you then set OPC again as the communication driver, the area pointer Coordination can again be used eight times.

Communication resources: SIMATIC S7 1200

The SIMATIC S7 1200 controller provides six communication resources for HMI communication.

The number of HMI connections that you can actually configure depends on the HMI devices that you connect with the SIMATIC S7 1200.

One HMI Panel occupies one communication resource per connection.



Connection resources

Available connection resources reserved for

ES communication: 3

HMI communication: 6

S7 communication: 8 Already configured: 0

Open user communication: 8

Free available connections: 7

Maximum number available resources: 32

Valid operand types for communication with Mitsubishi MC TCP/IP

Operand type "W" is not available for the "String" data type.

2.3.4 Compiling and loading

Contents

Information that could not be included in the online help.

Compiling and loading

If internal errors or warnings occur during compiling, compile the complete project using the command "Compile > Software (rebuild all)" in the shortcut menu of the HMI device.

Before you start productive operation with your project, compile the entire project using the "Compile > Software (rebuild all)" command from the shortcut menu of the HMI device.

If you are using HMI tags that are connected to the control tags in your project, compile all modified blocks with the command "Compile > Software" in the shortcut menu before you compile the HMI device.

Saving the WinCC project

If you save a project in WinCC using the "Save As…" command, this has no effect on the name of the Runtime projects generated for the devices. If you do not adapt the target path of the devices in the "Extended download to device" dialog, the Runtime projects on the target devices will be overwritten.

Settings for update of operating system

If you select the command "Online > HMI device maintenance > Update operating system" from WinCC, you cannot change the settings such as the type of PG/PC interface or baud rate. The settings used during the last download are always used.

To make changes to the settings, open the "Extended download" dialog using the "Online > Extended download to device" command and change the settings. When you click the "Load" button the changed settings are saved.

Alternatively, you can perform an update of the operating system with changed settings with ProSave. You start ProSave via the Windows Start menu "Siemens Automation > Options and Tools > HMI Tools > SIMATIC ProSave".

Incorrect installation of ProSave

If you receive an error message during installation of ProSave when loading data to a target device or maintenance of an HMI device, then you cannot remedy this error using the repair function of setup. Remove ProSave via the Control Panel. Then start setup and install the "ProSave" component again.

Checking the address parameters

During compilation of an HMI device in the project tree with the command "Compile > Software" in the shortcut menu, the address parameters of the HMI device, such as the IP address, will not be checked. If you want to ensure that the address parameters are checked as well, you will have to compile the HMI device in the "Devices & Networks" editor of the toolbar.

Error message when downloading data to the PLC

A panel and a PLC are connected and communicating with other.

If a tag is accessed while downloading data from the panel to the PLC, an error message is displayed on the panel.

Delayed reaction in the "Extended download to device" dialog

If the settings in the "Extended download to device" dialog for "Type of the PG/PC interface" and "PG/PC interface" do not match the settings on the HMI device, this can result in the application not responding for up to a minute.

Extended download with an S7-1200 and a Comfort Panel

An S7-1200 PLC and a Comfort Panel are located in the same physical network as the PG/PC. You open the "Extended download to device" dialog for the Comfort Panel.

If you activate the option "Show all accessible devices", it may occur that the application stops responding.

OP77A, OP73, TP177A: Loading projects

When loading a project to an HMI device, it can happen that Runtime is not automatically ended, even though "Remote Transfers" is activated in the Panel.

If this happens, stop Runtime and manually set the transfer mode on the HMI device.

Loading a SIMATIC HMI application to a PC station

The following circumstances can lead to an error message during the first load of a SIMATIC PC station:

- A SIMATIC HMI application is configured in a PC station in the project
  - WinCC Runtime Advanced
  - WinCC Runtime Professional
  - WinCC Standby
  - or WinCC Client
- The property "S7RTM is installed" is activated.

Before you load a SIMATIC PC station for the first time, select the configured device HMI_RT (WinCC...) in the project navigation. Open the "Extended download to device" dialog and select the appropriate interface and parameter settings. Click "Load".

You then load the PC station as normal.

Unpacking a distributed "Pack&Go" file

To unpack a "Pack&Go" file which is distributed over several files, you need an unpack program. The unpack program integrated in the operating system is not adequate to unpack distributed files.

2.3.5 Runtime

2.3.5.1 Notes on operation in Runtime

Contents

Information that could not be included in the online help.

> ⚠ CAUTION
>
> **Ethernet communication**
>
> In Ethernet-based communication, the end user is responsible for the security of his data network. The proper functioning of the device cannot be guaranteed in all circumstances; targeted attacks, for example, can lead to overload of the device.

Special characters in the user view

Special characters, such as / " § $ % & ' ?, are not permitted when entering a name or the password in the user view.

Language behavior - Layout of screen keyboard

The layout of the screen keyboard is not switched when the runtime language changes.

Tag values overwrite the maximum length

You enter a character string in a string tag via an I/O field. If the character string exceeds the number of configured tags, the character string will be shortened to the configured length.

2.3.5.2 Notes on operation of panels in Runtime

Contents

Information that could not be included in the online help.

Using the mouse wheel in Runtime

The use of the mouse wheel in Runtime is not supported on all panels.

2.3.6 HMI devices

2.3.6.1 General notes

Contents

Information that could not be included in the online help.

If the PC goes into standby or hibernate mode while the transfer is in progress, the panel status after interruption of the transfer is not defined.

TS Adapter with Ethernet interface

If an HMI device is connected via Ethernet and a TS adapter, it can not be reset to factory settings.

Simulation of the Basic Panels

Use an output field in an alarm text to output an external tag. The content of the output field will always be displayed with "0" during simulation.

Simulation with real PLC connection

The access point used by the simulation is independent from the settings of the Engineering System and can only be altered in the Control Panel with the "Setting PG/PC Interface" tool. If the PLC connection is terminated right after the start of the simulation with alarm 140001, you should check the access point used by the simulation with "Setting PG/PC Interface".

1. Double-click "Setting PG/PC Interface" in the Control Panel. A dialog opens.
2. Select" "S7ONLINE" in the "Access point of application" field as standard for HMI.
3. Select the interface in the "Interface Parameter Assignment Used" area.
4. Exit the dialog "Setting PG/PC Interface" with OK

Loading of projects without recipe data records

You are using recipes in a project. You transfer the project to a Basic Panel without recipe data records.

You may encounter inconsistencies if you have altered the structure of the recipe in the Engineering System and the device already held recipe data records.

Check the consistency of the data records in this case. The device will not issue a note for all structural changes.

Floating point numbers on MP 277, MP 377, TP 177B 4" and CP4

Only floating point numbers in the range from 10^{-293} ... 10^{+307} are displayed correctly on the HMI devices MP 277, MP 377, TP 177B 4" and CP4. If the tag value is outside this range, it is displayed as 0.

USB device driver under Windows XP

If a configuration PC with Windows XP and a Comfort Panel are connected via USB, the S7-USB driver may be reinstalled when the HMI device is restarted. The device settings may in this case not be restored.

Installation 3

3.1 System requirements for installation

3.1.1 Notes on the system requirements

System requirements for individual products

The system requirements may differ depending on the products you want to install. You should therefore check the individual system requirements of your products.

If you want to install several products, make sure that your system meets the demands of the product with the highest requirements.

Displaying PDF files

To be able to read the supplied PDF files, you require a PDF reader that is compatible with PDF 1.7 e.g. Adobe (R) Reader version 9.

Displaying the Welcome Tour

You require the Adobe (R) Reader as of version 9 to start the Welcome Tour for the TIA portal.

See also

Licenses (Page 71)

Starting installation (Page 73)

Displaying the installed software (Page 77)

Modifying or updating installed products (Page 78)

Repairing installed products (Page 80)

Starting to uninstall (Page 82)

3.1.2 System requirements STEP 7 Basic

3.1.2.1 Software and hardware requirements STEP 7

System requirements for installation

The following table shows the minimum software and hardware requirements for installation of the "SIMATIC STEP 7 Basic" software package:

Hardware/software	Requirement
Processor	Pentium 4, 1.7 GHz or similar
RAM	1 GB
Free hard disk space	2 GB on system drive "C:"
Operating systems *	• Windows XP (Home SP3, Professional SP3) • Windows 7 (Home Premium, Professional, Enterprise, Ultimate)
Graphics card	32 MB RAM 24-bit color depth
Screen resolution	1024 x 768
Network	10Mbit/s Ethernet or faster
Optical drive	DVD-ROM

* For more detailed information on operating systems, refer to the help on Microsoft Windows or the Microsoft homepage.

Recommended hardware

The following table shows the recommended hardware for the operation of STEP 7.

Hardware	Requirement
Computer	SIMATIC FIELD PG M2 PREMIUM (or similar PC)
Processor	2.2 GHZ CORE 2 DUO (T7500)
RAM	1X2GB DDR2 RAM
Hard disk	250GB S-ATA HDD
Monitor	15" SXGA+ DISPLAY (1400 X 1050)
Optical drive	DL MULTISTANDARD DVD RW

3.1.3 System requirement for WinCC Basic

3.1.3.1 Software and hardware requirements

Introduction

Specific requirements for the operating system and software configuration must be met for the installation.

Note

WinCC is generally authorized for use in a domain or workgroup.

However, be aware that domain group policies and restrictions of the domain may hinder the installation. If this happens, remove the computer from the from the domain prior to installing Microsoft Message Queuing, Microsoft SQL Server 2005 and WinCC. Log onto the computer in question locally with administrative rights. Then perform the installation. After successful installation, you can enter the WinCC computer back into the domain. If the domain group policies and restrictions of the domain do not impede the installation, the computer need not be removed from the domain during the installation.

Be aware that domain group policies and restrictions of the domain may also hinder operation. If you cannot avoid these restrictions, run the WinCC computer in a workgroup.

Consult with the domain administrator if needed.

Installation requirements

The following table shows the minimum software and hardware requirements that have to be met for installation of the "SIMATIC WinCC Professional" software package:

Hardware/software	Requirement
Processor type	Pentium M, 1.6 GHz or similar
RAM	2 GB
Free hard disk space	2 GB on system drive "C:"
Operating systems *	• Windows XP Professional SP3 • Windows 7 (Professional, Enterprise, Ultimate) • Windows 7 SP1 (Professional, Enterprise, Ultimate) • Windows Server 2003 R2 Standard Edition SP2 • Windows Server 2008 Standard Edition SP2
Graphics card	32 MB RAM 24-bit color depth
Screen resolution	1024x768
Network	Ethernet 10 Mbps or faster

Hardware/software	Requirement
Optical drive	DVD-ROM
Software	Microsoft .Net Framework 3.5 SP1 Microsoft Windows Message Queuing

* For more detailed information on operating systems, refer to the help on Microsoft Windows or the Microsoft homepage.

Simultaneously opening multiple instances of WinCC on a configuration PC can also increase the hardware capacity required.

Note

"Aero Glass Style" of Microsoft Windows 7

A powerful graphics card is required for "Aero Glass Style". It requires DirectX9 capabilities and 128 MB of dedicated graphics memory.

The performance of the architecture of the graphics system can significantly influence the performance of WinCC.

Recommended hardware

The following table shows the recommended hardware for the operation of SIMATIC WinCC.

Hardware	Requirement
Computer	SIMATIC FIELD PG M2 PREMIUM
Processor	2.2 GHZ CORE 2 DUO (T7500)
RAM	1X2GB DDR2 RAM
Hard disk	250GB S-ATA HDD
Monitor	15" SXGA+ DISPLAY (1400 X 1050)
Optical drive	DL MULTISTANDARD DVD RW

Parallel installation of WinCC V11 and other SIMATIC products

The parallel installation of WinCC V11 is permitted with the following other SIMATIC products

- WinCC Basic V11, WinCC Comfort V11 or WinCC Advanced V11 can be installed on a computer parallel to STEP 7 V5.4 or V5.5, STEP 7 Micro/WIN, STEP 7 10.5, WinCC flexible (as of 2008) and WinCC (as of V7.0 SP2).
  When WinCC V7 is removed, the Setup for WinCC V11 should be run and a repair performed for the installation.
- WinCC Professional V11 can be installed on a computer parallel to STEP 7 V5.4 or V5.5, STEP 7 Micro/WIN, STEP 7 10.5 and WinCC flexible (as of 2008).

Installing Microsoft .Net Framework

.Net Framework 3.5 SP1 is included on the installation medium. The installation routine determines if .Net Framework is already installed at the beginning of the installation. If .Net Framework is not installed, you will be prompted with a dialog to perform the installation. When you confirm the prompt for installation, .Net Framework is installed. You need to reboot the computer after installing .Net Framework. If you do not install .Net Framework, the installation of WinCC Runtime Professional is aborted.

Installing Microsoft Windows Message Queuing in Windows XP

You can install the Windows Message Queuing component from the Windows Control Panel.

Click Start > Control Panel. Double-click "Add or remove software", the "Add or remove software" dialog opens. In the "Add or Remove Programs" dialog, click "Add or Remove Windows Components". The Windows Components Wizard opens. Select the "Message Queuing" component in the Windows Components Wizard. Click "Next", the "Message Queuing" component is installed.

Installing Microsoft Windows Message Queuing in Windows 7

You can install the Windows Message Queuing component from the Windows Control Panel.

Click Start > Control Panel. Click "Programs" and the "Programs" dialog opens. Under the "Programs and Features" section, click "Turn Windows features on or off". The "Windows Features" dialog opens. In the "Windows Features" dialog, select the "Microsoft Message Queue Server" feature. Click "OK" to enable the "Microsoft Message Queue Server".

Online help for Windows 7 / Windows Server 2008

Windows 7 and Windows Server 2008 no longer support all online help formats by default. With WinCC, these online help formats are used in the following cases:

- Calling WinCC Direct Help
- Calling the WinCC Information System from the WinCC editors or via the Direct Help links

To be able to continue calling WinCC Direct Help, the following components are installed during the installation of WinCC:

- Microsoft Help Engine

You can also call the WinCC Information System under Windows 7 and Windows Server 2008 from the Windows Start menu or from the installation folder.

To call the WinCC Information System from the WinCC editors or via the Direct Help links, some changes have to be made to the operating system. You can find more information on this in the section "More information for advanced users" of Microsoft Support article "917607": http://support.microsoft.com/kb/917607 (http://support.microsoft.com/kb/917607)

Licensing of WinCC Engineering System (Page 66)

3.1.3.2 Licenses and Powerpacks

Licensing of WinCC Engineering System

You require a license key for the following:

- WinCC Engineering System, for example, WinCC Professional
- Add-ons for WinCC Engineering System

You can install the license key during the installation of WinCC. You transfer the licenses for WinCC add-ons after installation with the Automation License Manager.

Starting without a valid license key

If you start WinCC without a valid license, the system alerts you that you are working in non-licensed mode. You have the option of activating a one-time trial license. Trial licenses for Engineering editions WinCC Basic, Comfort, Advanced und Professional expire after 21 days.

When the trial license expires, the following scenarios can occur:

- WinCC was never licensed on the PC in question.
  - Operations requiring a license can no longer be performed in WinCC.
- WinCC was already licensed on the PC in question.
  - An alert for non-licensed mode is presented every 10 minutes and for every action requiring a license by a window requiring acknowledgment.

License requirements for simulation

When you want to start simulation in WinCC using the menu command "Online > Simulation> With tag simulator", you do not need licenses for WinCC Runtime or licensed-based add-ons.

If the following conditions are met, you also need the appropriate licenses for the simulation of WinCC Runtime and license-based add-ons:

- The engineering station is connected to a PLC.
- The connection to the PLC is configured and active.

You start the simulation with the "Online > Simulation > Start" menu command.

Software and hardware requirements (Page 63)

Licensing of HMI devices (Page 67)

Working with license keys (Page 68)

Licensing of HMI devices

Non-PC-based HMI devices are always equipped to maximum capacity. A license key is not required for runtime operation.

A license is required for each add-on for non-PC-based HMI devices. The license key of the respective license always activates one instance for use.

License key

To be able to license non-PC-based HMI devices with license keys, you require the "SIMATIC HMI License Manager Panel Plug-in" add-on.

WinCC Setup installs this add-on by default. You can open the License Manager Panel plug-in in the Automation License Manager with the menu command "Edit > Connect Target System > Connect HMI Device".

If WinCC is not installed, an installation of ProSave 7.2 or higher is required.

Note

Further information about handling the licenses can be found in the Automation License Manager help.

Note

Verify that the current release of the operating system is installed on the HMI device before you start licensing. If necessary, update the operating system using ProSave.

Data backup

CAUTION

Destruction of license keys on non-PC-based HMI devices

Installed license keys and authorizations are destroyed by the backup/restore processes on the HMI devices listed below.

- 270 series
- 370 series

Carry out the following before beginning restoring:

- Use the Automation License Manager and ProSave to check whether license keys are installed on the HMI device.
- Remove any license keys present on the HMI device.
  After restoring has been carried out, re-install the license keys on the HMI device.

Non-licensed mode

Runtime add-ons can also be used without a license without restriction. An alert for non-licensed mode is presented every 10 minutes by a window requiring acknowledgment.

See also

Licensing of WinCC Engineering System (Page 66)

Working with license keys

Introduction

Install a license key in the following situations:

- To use the WinCC Engineering System
- To use add-ons for the WinCC Engineering System
- To operate WinCC Runtime
- To use add-ons for WinCC Runtime on PC-based HMI devices
- To use add-ons on non-PC-based HMI Devices

To uninstall a license key in the following cases:

- When backing up data
- If you no longer require the license

You can then use this license on another PC or HMI device.

When you install a license, the associated license key is removed from the license key storage location.

Note

A license key cannot be copied. The copy protection employed prevents the license keys from being copied.

Data backup

Remove the license keys on the HMI device when backing up data on the HMI device and when creating a backup during device replacement.

You use the Automation License Manager to back up license keys of a HMI device to the storage area of the license key.

CAUTION

Destruction of license keys on non-PC-based HMI devices

Installed license keys are destroyed by backup/restore processes on the HMI devices listed below.

- 270 series
- 370 series

Carry out the following before beginning restoring:

- Use the Automation License Manager and ProSave to check whether license keys are on the HMI device.
- Remove any license keys present on the HMI device.
  After restoring has been carried out, re-install the license keys on the HMI device.

CAUTION

Destruction of license keys on PCs

Start by removing all license keys in the following situations:

- Before you format the hard disk
- Before you compress the hard disk
- Before you restore the hard disk
- Starting an optimization program that moves fixed blocks
- Installing a new operating system

Read the description of Automation License Manager ("Start > Simatic Automation > Documentation"). Observe all warnings and notices.

The license key storage location on PC-based HMI devices and on non-PC-based HMI devices where Automation License Manager is used may contain multiple license keys. This capability means you can store multiple licenses of the same type at one location. Save all license keys of the HMI device to the same storage location.

CAUTION

Always keep the original storage location of the license keys.

Invalid license after time zone change

The installed license no longer functions in the following case.

- If you change the time zone on a WinCC PC as follows:
  - From a time based on a complete hour to a time not based on a complete hour. Example: You change the time zone from GMT +3:00 to GMT +3:30.

To avoid this inconvenience, uninstall the license key under the time zone setting that was set when the license key was installed.

Example:

You have installed the license key with a time zone setting based on a full hour. Then also uninstall the license key with a time zone setting based on a full hour.

This behavior does not apply to the trial license.

Defective license

A license is defective in the following cases:

- If the license key is no longer accessible at the storage area.
- If the license key disappears during its transfer to the destination drive.

You can use the Automation License Manager to repair the defective license. Use the "Restore" function or the "Restore Wizard" of the Automation License Manager for this purpose. Contact Customer Support in order to restore the license. For additional information see: http://support.automation.siemens.com (http://support.automation.siemens.com)

Note

The runtime software can also be operated without errors if the license is missing or defective. The system alerts you at brief intervals that you are working in non-licensed mode.

CAUTION

If you start WinCC Engineering System without a valid license key, the system alerts you that you are working in non-licensed mode. You have the one-time option of activating a trial license. The trial license expires after 21 days.

When the trial license expires, the following scenarios can occur:

- WinCC was never licensed on the PC in question.

  WinCC can no longer be started.
- WinCC was already licensed on the PC in question.

  WinCC cannot be started. An alert for non-licensed mode is presented every 10 minutes by a window requiring acknowledgment.

3.2 Licenses

Availability of licenses

The licenses for the products of the TIA Portal are usually supplied on the installation data medium and installed automatically by the Automation Licence Manager during the installation process of the TIA Portal.

If you remove the TIA Portal, the corresponding licenses are also removed automatically. Licenses still required should be secured.

Provision of the Automation License Manager

The Automation License Manager is supplied on the installation data medium and is transferred automatically during the installation process.

If you remove the TIA Portal, the Automation License Manager remains installed on your system.

Working with the Automation License Manager

The Automation License Manager is a product of Siemens AG, which is used for handling license keys (technical representatives of licenses).

Software products that require license keys for operation, such as the TIA-Portal, register the required license key automatically with the Automation License Manager . If the Automation License Manager finds a valid license key for this software, the software can be used according to the license usage terms associated with this license key.

Note

For additional information on how to manage your licenses with the Automation License Manager , refer to the documentation supplied with the Automation License Manager .

Installation log (Page 72)

3.3 Installation log

Function of the installation log

The progress during the following installation processes is logged in a file:

- Installing products
- Modifying or updating already installed products
- Repairing an existing installation
- Uninstalling products

If errors occur during the installation process or warnings are issued, these can be evaluated with the help of the log file. You can do this yourself or contact product support.

Installation logs storage location

The log file is the most recent file with the file extension ".log" and whose name begins with "SIA", e.g. "SIA_STEP7_PRO_V11.log".

The location of the log file is stored in the environment variable "%autinstlog%". You can enter this environment variable in the address bar of Windows Explorer to open the folder with the log files. Alternatively, you can navigate to the corresponding directory by entering "CD %autinstlog%" in the command line.

The location depends on the operating system, e.g. "C:\Documents and Settings\All Users\Application Data\Siemens\Automation\Logfiles\Setup" in the English version of Windows XP.

Setup_Report (CAB file)

To make it easier to provide Product Support with all necessary files, an archive file that contains the installation log and all other required files is saved in CAB format. This archive can be found at "%autinstlog%\Reports\Setup_report.cab". Send this CAB file to Product Support if you need assistance with installation. With this information, Product Support can determine whether the installation was executed properly. CAB files that were generated during earlier installation processes are saved with a date ID in the "Reports" directory.

3.4 Starting installation

Introduction

Software packages are installed automatically by the setup program. The setup program starts once the installation medium has been inserted in the drive.

Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

Procedure

To install the software packages, follow these steps:

1. Insert the installation medium in the relevant drive.

   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.

2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.

   The dialog for selecting the setup language opens.

3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.

   The help file containing the notes opens.

5. Once you have read the notes, close the help file and click the "Next" button.

   The dialog for selecting the product languages opens.

6. Select the languages for the product user interface, and click the "Next" button.

   Note

   "English" is always installed as the basic product language.

   The dialog for selecting the product configuration opens.

7. Select the products you want to install:
   – If you wish to install the program in a minimal configuration, click on the "Minimal" button.

   – If you wish to install the program in a typical configuration, click on the "Typical" button.

   – If you wish to personally select the products to be installed, click on the "User-defined" button. Then select the check boxes for the products you wish to install.

8. If you want to create a shortcut on the desktop, select the "Create desktop shortcut" check box.
9. Click the "Browse" button if you want to change the target directory for the installation. Note that the length of the installation path must not exceed 89 characters.
10. Click the "Next" button.

    The dialog for the license terms opens.
11. To continue the installation, read and accept all license agreements and click "Next".

    If changes to the security and permissions settings are required in order to install the TIA Portal, the security settings dialog opens.
12. To continue the installation, accept the changes to the security and permissions settings, and click the "Next" button.

    The next dialog displays an overview of the installation settings.
13. Check the selected installation settings. If you want to make any changes, click the "Back" button until you reach the point in the dialog where you want to make changes. Once you have completed the desired changes, return to the overview by clicking on "Next".
14. Click the "Install" button.

    Installation is started.

    Note

    If no license key is found during installation, you have the chance to transfer it to your PC. If you skip the license transfer, you can register it later with the Automation License Manager.

    If the installation was successful, a message to this effect is displayed on the screen. If errors occurred during installation, an error message is displayed informing you of the type of errors.

    ---
15. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
16. If the computer does not reboot, click "Exit".

Result

The TIA Portal along with the products and licenses you have ordered and the Automation License Manager have been installed on your computer.

Starting to uninstall (Page 82)

3.5 Installing Support Packages

You can install subsequent support packages, for example, hardware support packages, in the TIA Portal.

Note

Support packages for STEP7 V5.4 or V5.5 cannot be used.

Procedure

To install a Support Package, follow these steps:

1. Click "Support packages" in the "Options" menu.

   The "Detailed information" dialog opens. A table lists all support packages from the directory that you selected as the storage location for support packages in the settings.

2. If you want to install a support package that is not in the list, you have the following options:

   – If the support package is already on your computer, you can add it to the list by selecting "Add from the file system".

   – If you add a support package from the "Service & Support" page on the Internet, first you download it by selecting "Download from the Internet". Then you can add it from the file system.

3. Select the support package that you want to install.
4. Click "Install."
5. Close and then restart the TIA Portal.

See also

Installation log (Page 72)

3.6 Displaying the installed software

You can find out which software is installed at any time. In addition, you can request additional information on the installed automation software to be displayed.

Procedure

To display an overview of the software installed, follow these steps:

1. Click "Installed software" in the "Help" menu.

   The "Installed software" dialog opens. You will see the installed software products in the dialog. Expand the entries to see which version is installed in each case.

2. If you would like to display additional information on the installed automation software, click the link on the "Detailed information about installed software" dialog.

   The "Detailed information" dialog opens.

3. Chose the topic you want more information about in the area navigation.

Installation log (Page 72)

3.7 Modifying or updating installed products

You have the option to modify installed products using the setup program or to update to a new version.

Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

Procedure

To modify or update installed products, follow these steps:

1. Insert the installation medium in the relevant drive.

   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.

   The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.

   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.

   The dialog for selecting the installation variant opens.
6. Select the "Modify/Upgrade" option button and click the "Next" button.

   The dialog for selecting the product languages opens.
7. Select the check boxes of the product languages that you want to install. You can remove previously installed product languages by clearing the corresponding check boxes.

   Note

   Note that the product language "English" cannot be removed.
8. Click the "Next" button.

   The dialog for selecting the product configuration opens.
9. Select the check boxes of the components that you want to install. You can remove previously installed components by clearing the corresponding check boxes.

10. Click the "Next" button.

    Note

    Note that you cannot change the target directory because the existing installation is being modified.

    If changes to the security and permissions settings are required in order to install the TIA Portal, the security settings dialog opens.

11. To continue the installation, accept the changes to the security and permissions settings, and click the "Next" button.

    The next dialog displays an overview of the installation settings.

12. Click the "Modify" button.

    This starts the installation of the additional components.

    Note

    If the installation was successful, a message to this effect is displayed on the screen. If errors occurred during installation, an error message is displayed informing you of the type of errors.

    ---

13. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".

14. If the computer does not reboot, click "Exit".

Result

The existing installation has been modified on your computer.

3.8 Repairing installed products

You have the option to repair installed products by completely reinstalling them using the setup program.

Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

Procedure

To repair installed products, follow these steps:

1. Insert the installation medium in the relevant drive.

   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.

   The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.

   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.

   The dialog for selecting the installation variant opens.
6. Select the "Repair" option button, and click the "Next" button.

   The next dialog displays an overview of the installation settings.
7. Click the "Repair" button.

   This starts the repair of the existing installation.

   Note

   If the installation was successful, a message to this effect is displayed on the screen. If errors occurred during installation, an error message is displayed informing you of the type of errors.
8. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

Result

The installed products have been reinstalled.

Installation log (Page 72)

3.9 Starting to uninstall

Introduction

Software packages are removed automatically by the setup program. Once started, the setup program guides you step-by-step through the entire removal procedure.

You have two options for removing:

- Removing selected components via the Control Panel
- Removing a product using the installation medium

Note

The Automation License Manager will not be removed automatically when you remove the software packages, because it is used for the administration of several license keys for products supplied by Siemens AG.

Removing selected components via the Control Panel

To remove selected software packages, follow these steps:

1. Open the Control Panel with "Start > Settings > Control Panel".
2. Double click on "Add or Remove Programs" in the control panel.

   The "Add or Remove Programs" dialog opens.
3. Select the software package to be removed in the dialog "Add or Remove Programs", and click "Remove".

   The dialog for selecting the setup language opens.
4. Select the language in which you want the setup program dialogs to be displayed and click the "Next" button.

   The dialog for selecting the products you want to remove opens.
5. Select the check boxes for the products that you want to remove and click the "Next" button.

   The next dialog displays an overview of the installation settings.
6. Check the list with the products to be removed. If you want to make any changes, click the "Back" button.
7. Click the "Uninstall" button.

   Removal begins.
8. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

Removing a product using the installation medium

To remove all software packages, follow these steps:

1. Insert the installation medium in the relevant drive.

   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.

   The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.

   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.

   The dialog for selecting the installation variant opens.
6. Select the "Uninstall" option button and click the "Next" button.

   The next dialog displays an overview of the installation settings.
7. Click the "Uninstall" button.

   Removal begins.
8. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

3.10 Installing and uninstalling the migration tool

3.10.1 System requirements

System requirements for the migration tool

The following system requirements apply to the use of the migration tool:

- All products used to create the source project must be installed. The following products are supported:
  - SIMATIC STEP 7 V5.4 SP5 and STEP 7 V5.5
  - WinCC V7 SP1 or V7 SP2
  - WinCC flexible V1.3 SP2
- All optional packages needed to process the STEP 7 project are installed. For example, all HSPs for the devices used in the source project are required.

3.10.2 Installing the migration tool

Distribution of the migration tool

The migration tool is available for download from the Service & Support area of the Siemens website.

Normally, the migration tool is installed without the TIA Portal. Because the TIA Portal has its own integrated migration function, a separate installation of the migration tool is not necessary.

Procedure

To install the migration tool, proceed as follows:

1. Download the installation file from the Service & Support area on the Siemens website.
2. Run the downloaded file.

   The setup program for the migration tool will open.
3. First, select the language in which the setup should be displayed and click the "Next" button.

   The page for selecting the software language is displayed.
4. Since the migration tool is provided exclusively in English, you cannot choose any other language for the installation. Therefore, click "Next" to proceed to the next step.

   The page for selecting the product is displayed.

5. The migration tool consists solely of a software component. Therefore, the migration tool is already selected.

   To create a Desktop icon for starting the migration tool, select the check box "Create Desktop icon". Then click the "Next" button.

   The page for confirming the licensing terms is shown.

6. Click on an entry in the list of license terms to read the selected license term. If you agree with all license terms, select the check box "I accept the terms of the displayed license agreement". Then click the "Next" button.

   An overview of the installation is displayed.

7. Click the "Install" button.

   The installation is performed with the displayed settings.

3.10.3 Uninstalling the migration tool

The migration tool can be removed using the Control Panel.

Procedure

To remove the migration tool, follow these steps:

1. Open the Control Panel.
2. Double click on "Add or Remove Programs" in the Control Panel.

   The "Add or Remove Programs" dialog opens.

3. Select the "TIA Portal Migration Tool V11" entry in the "Add or Remove Programs" dialog, and click the "Remove" button.

   A confirmation prompt appears.

4. Click the "Uninstall" button to confirm this prompt.

   The migration tool will be removed.

Migrating projects 4

4.1 Migrating projects

Migration of existing projects

You can migrate projects from earlier automation solutions to the TIA Portal. Each time you migrate, a new project is created for the migrated data with which you can then work. Any projects already open are closed first.

The migration is then displayed in the table of the project history. From here, you have access to a log file that is created automatically for the migration.

Supported products for migration

The chapter "System overview STEP 7 and WinCC" includes information on the products that are available for the TIA Portal. In principle, all products listed there are supported by the TIA Portal during migration.

Any additional requirements that must be met depend on the initial products that were used and the currently installed products. For more information on the migration options for your products, you can, for example, refer to the Service & Support Internet pages and the documentation of your software products.

See also: Scaling of STEP 7 and WinCC (Page 23)

Procedure during migration

The migration process is divided into the following basic steps:

1. Preparing the initial project

   If the software that was used to create the initial project is not installed or is only partly installed on the programming device/PC together with the TIA Portal installation, you first need to convert the project to a special migration format with the file extension "AM11". To do this, install the migration tool on a PG/PC on which the required software is installed.

   Then, use the migration tool to convert the initial project, and copy the file to the programming device/PC on which the TIA Portal is installed.

   You can omit this step if the initial project and its associated software are on the same programming device/PC as the TIA Portal. In this case, you can directly migrate the source project.

2. Performing migration

   You perform the actual migration within the TIA Portal.

3. Checking the migration log

   A log is created for each migration, in which the result of the migration is stored. In this log, you can find information on project components that have been lost or modified, or, when applicable, the reasons why the migration of a project could not be performed. Check this log after migration. Immediately after completion of the migration, the log is displayed in the Inspector window. You can also open the log from the project history. If a migration is not possible, you can decide where the log will be saved.

4. Correcting the migrated project

   Because the configurations of the initial project may not always be completely compatible with the TIA Portal, not all configurations are transferred in identical form in the migrated project. You should therefore work through the points in the migration log systematically.

Excluding the hardware configuration from the migration

If you know at the outset that hardware used in the initial project is not supported by the TIA Portal, you can exclude the hardware configuration from the migration. In this case, only the software is migrated.

An unspecified device is then generated in the migrated project for the devices contained in the initial project. The hardware and network configurations and the connection are not migrated. You can convert the unspecified devices into suitable devices after the migration and create any network configurations and connections manually.

4.2 Preparing projects with the migration tool

4.2.1 Migrating projects with the migration tool

Preparation for migration

In many cases, a project you want to migrate is not located on the same programming device/PC on which the TIA Portal V11 is installed. Therefore, the initial project must first be converted to a compatible format for the migration. You then copy the migration file to the programming device or PC on which the current version of the TIA Portal is installed. There you can then read the file into the TIA Portal and create a project in the current file format of the TIA Portal.

Procedure for migration with the migration tool

To perform a migration without the initial software, the following preparatory steps are necessary:

1. Install the migration tool on the programming device/PC where the source project is located. To do this, download the installation file from the Service & Support area on the Siemens website.
2. Start the migration tool and use it to convert the source project to the migration file format with file extension ".ap11".

   For this step, make sure that all software needed to process the source project is installed on the programming device/PC. This also includes all necessary service packs, hardware support packages and all expansion software that is needed to process the initial project. If individual products are not installed it may not be possible to perform the migration or the migration may be incomplete.
3. Copy the migration file to the target system on which a current version of the TIA Portal is installed.

   Note that the target system must have been installed with all software needed to configure the complete set of devices contained in the migration.
4. Perform the migration within the TIA Portal, and specify the migration file as the source.
5. Following the migration, check the log file and work through the information provided there for the newly created project in a systematic manner. Read the information in the Inspector window with special care after the first compilation of the configuration.

Excluding the hardware configuration from the migration

If you know at the outset that hardware used in the initial project is not supported by the TIA Portal, you can exclude the hardware configuration from the migration. In this case, only the software is migrated.

An unspecified device is then generated in the migrated project for the devices contained in the initial project. The hardware and network configurations and the connection are not migrated. You can convert the unspecified devices into suitable devices after the migration and create any network configurations and connections manually.

Creating a migration file (Page 91)

4.2.2 Calling the migration tool

Starting the migration tool

A "Migration to TIA Portal V11" shortcut is always created during the installation in Start menu under "Siemens Automation > Migration Tool". Click this shortcut.

Alternatively, you can call the migration tool directly in Windows Explorer. The migration tool is saved to the following default folder during installation: "C:\Program Files\Siemens\Automation\Portal V11\Mig\bin". To start the migration tool, click the "Siemens.Automation.MigrationApplication.exe" file in this directory.

See also

Creating a migration file (Page 91)

4.2.3 Creating a migration file

The section below describes how you can use the migration tool to convert the initial project into a migration file that can be read by the TIA Portal. Following conversion, this file is transferred to the target system and migrated there.

You can specify whether the migration file should contain the entire project, including the complete hardware configuration and the associated software, or whether you want to migrate the software only.

Requirement

- The suitable, original software with a valid license is installed for all configurations used in the initial project.
- The initial project is not provided with access protection.
- The initial project must be consistent, otherwise problem-free migration cannot be assured.

Procedure

To create the migration file, follow these steps:

1. Choose the path of the source file for the migration in the "Storage Location (Path)" field.
2. Select the check box "Exclude hardware configuration" to migrate the software only.
3. Choose the path and the file name for the migration file in the "Intermediate file".
4. Click the "Migrate" button.

Result:

A migration file is created. Finally, copy this file to the target system and migrate this file in the TIA Portal.

Migrating projects (Page 92)

Calling the migration tool (Page 90)

Migrating projects with the migration tool (Page 89)

4.3 Migrating projects

Requirement

- There is already a converted file in the format AM11 available or the original software with a valid license is installed for all the configurations in the initial project.
- The initial project is not provided with access protection.
- The initial project must be consistent, otherwise problem-free migration cannot be assured.

Read the additional information on the requirements in the help for the respective products installed.

Note

System hibernation during the migration

While a migration is running, the system should not be changed to the standby or hibernate mode. Otherwise the migration will be aborted.

Procedure

To migrate a project, follow these steps:

1. Select the "Migrate project" command in the "Project" menu.

   The "Migrate project" dialog opens.
2. Specify the path and the file name for the project to be migrated in the "Source path" field. Choose either a project in the AM11 migration format or in the format of the initial project.
3. Select the check box "Exclude hardware configuration" to migrate the software only.

   If you have selected a migration file that was created using the migration tool, the check box is disabled. In this case, you must specify if you wish to exclude the hardware configuration of the migration before the conversion with the migration tool .
4. Choose a name for the new project in the "Project name" box.
5. Choose a path in the "Target path" box where the new project will be created.
6. Enter your name or the name of another person responsible for the project in the "Author" field.
7. Enter a comment in the "Comment" box, if you require one.
8. Click "Migrate".

Result

The initial project is converted. The system outputs a message when the migration is complete. From here, you can directly open a log for the migration. The newly created project then opens in the project view. The migration log is also displayed in the Inspector window.

Migrating projects with the migration tool (Page 89)

Creating a migration file (Page 91)

4.4 Displaying the history of the migration

If a project was created by migration, the migration will be listed in the table of the project history. You can open the migration log in the table. The time of the migration is also shown.

Procedure

To display the migration in an overview table, follow these steps:

1. Select the open project in the project tree.
2. Select "Properties" in the shortcut menu of the project.

   The dialog with the properties of the project opens.
3. Select the "Project history" group in the area navigation.

   The overview table is displayed.

See also

Displaying properties of the project (Page 212)

4.5 Displaying the log file of the migration

A log file is created for each migration. The log file contains the following information:

- Migrated objects
- Modifications to objects made during migration
- Errors that occurred during migration

Procedure

To display the log file of the migration, follow these steps:

1. Select the open project in the project tree.
2. Select "Properties" in the shortcut menu of the project.

   The dialog with the properties of the project opens.
3. Select the "Project history" group in the area navigation.

   The overview table is displayed.
4. Click on the link to the log file in the "Log file" column.

   The log file is displayed in the Microsoft Internet Explorer.

Migrating projects (Page 87)

4.6 Migrating STEP 7 projects

4.6.1 Migration of STEP 7 projects

Introduction

You can migrate a project from SIMATIC STEP 7 V5.4 SP5, or from SIMATIC STEP 7 V5.5 to be able to continue to use it in the TIA Portal. It is also possible to migrate integrated projects with devices from other software products.

Scope of migration

Generally, you can migrate all of the configurations from SIMATIC STEP 7 V5.4 SP5 or V5.5 which are also supported by the TIA Portal STEP 7 Professional. This includes, for example, the following devices and configurations:

- Devices of the S7-300 and S7-400 family.
- PROFIBUS configurations with connected distributed I/O. These include GSD-based slaves, I-slaves as well as direct data exchange.
- PROFINET configurations with distributed I/O. These include GSDML-based devices and I-devices.
- Network configurations
- Connections
- Blocks created in the programming languages LAD, FBD or STL, S7-SCL, S7-GRAPH
- PLC tags
- User-defined data types (UDT)
- Alarms and alarm classes
- Interrupts
- User-defined attributes (DUE) if they are supported by STEP 7 Professional V11
- User text libraries

Migrating software without hardware configuration

If individual devices are not supported by the TIA Portal, you can exclude the hardware configuration from the migration. In this case, only the software is migrated.

The devices are displayed in the new project as unspecified devices. Networks, connections and the entire hardware configuration are not imported. After migration, convert the unspecified devices to suitable devices again. Then network the modules again and restore all the connections manually.

General notes on migrating program blocks (Page 105)

4.6.2 Requirements for the migration of STEP 7 projects

Various requirements for the software installed on the original PG/PC and for the initial project apply to the migration.

Requirements for the original PG/PC

The following requirements apply to the PG/PC:

- A licensed version of STEP 7 V5.4 SP5 or V5.5 must be installed.
- For all of the configurations used in the project, the corresponding additional software must be installed with a valid license, for example, optional packages.
- All HSPs for modules not included in the hardware catalog must be installed.
- All GSD/GSDML files used in the project must be installed.
- You must be logged on to the operating system with administrative rights.
- Either STEP 7 Professional V11 or the migration tool must be installed on the programming device/PC.

Requirements for the initial project

- The initial project must not be configured with access protection.
- The hardware must be consistent.
- The message number assignment must be set to CPU-oriented.
- It must contain no protected blocks with time stamp conflict.
- It must be possible to compile all programs and their sources without errors.
- All called blocks must be available in the block folder.
- The block folder must contain no blocks that are not called, in particular no instance data blocks.

Requirements for the programming device/PC with STEP 7 Professional V11

- A licensed version of STEP 7 Professional V11 or higher must be installed.
- For all of the configurations used in the project, the corresponding additional software must be installed with a valid license, for example, optional packages.
- All HSPs for modules that are not contained in the hardware catalog and all GSD/GSDML files used in the project must be installed.

4.6.3 Checking whether STEP 7 projects can be migrated

Before you start the migration, you can check if all necessary requirements for migration have been met.

Note

Note that the actual values are reset in the original project when the following steps are carried out. If this is not desired, first make a copy of the project and then carry out the check on the copy of the project.

Procedure

To check whether a project can be migrated, follow these steps:

1. Open the original project in SIMATIC STEP 7 V5.4 SP5 or V5.5. For a correct update, it is necessary that only the optional packages and modules, including HSPs, GSD and GSDML files, that are contained in STEP 7 Professional V11 are installed.
2. Open the individual stations. If no messages indicating missing components are displayed when the stations are opened, all the components necessary for migration are available.
3. Perform a block consistency check for each block container contained in the project.
4. Compile the entire project. If no errors are displayed during the compilation, the programs can be migrated.
5. Check whether all modules with an identical MLFB and the same firmware version are contained in the STEP 7 Professional V11 hardware catalog.
6. Check whether the CPU-oriented message number assignment is activated for each CPU.
7. Compile the project in NetPro. Here too, no errors should error.

4.6.4 Removing unsupported hardware components

If you have created configurations in the initial project for which not all of the right software is installed, then you can still migrate the project by manually deleting the unsupported configurations from the project. Alternatively, you can use the "Reorganize" function.

Procedure

To clean the original project, follow these steps:

1. Use an Installation of SIMATIC STEP 7 V5.4 or V5.5 that contains only the optional packages contained in STEP 7 Professional V11 and all required modules.
2. Save the project again and select the "With reorganization" option when saving. Any unsupported configurations will be removed from the project.

For modules that are only available in a new version or with a new firmware version in STEP 7 Professional V11, use the "Exchange object" function in the station to exchange an older module for one that can be migrated.

4.6.5 Special points to observe during migration

4.6.5.1 Device names

Station names

In SIMATIC STEP 7 V5.5, the name of an interface module is used as station name. In the TIA Portal, however, the name of the CPU will be used. For this reason, the station name is changed during the migration.

Names of modules and racks

In SIMATIC STEP 7 V5.5, the names of modules and racks do not have to be unique. In the TIA Portal, however, unique names are required. Therefore, the names of the modules and racks are incremented during the migration to make sure that unique names are assigned. This does not apply to PROFINET IO devices and PROFINET CPs. You must provide unique names for these yourself.

4.6.5.2 PROFINET IO configurations

Unique name assignment required

The names of PROFINET IO devices must be unique within the subnet. The same applies to the names of PROFINET CPs. For this reason, ensure that the name assignment is unique before the migration into the initial project or provide unique names after migration and before the first compilation.

Media redundancy with sync domains

If a sync domain with activated media redundancy is found in the initial project, the sync domain configuration is imported during migration. If, however, several sync domains with activated media redundancy are found in the initial project, they are removed and the project is migrated without the sync domains. In any case, you will receive a message which sync domains were imported.

In any case, use SIMATIC STEP 7 V5.5 to configure the media redundancy in the initial project.

Isochronous mode with PROFINET IO

Observe the following for PROFINET IO configurations in isochronous mode:

- IRT with high performance

  If you have configured IRT with high performance when planning the topology in the initial project, the option is changed to "RT" during migration. You will receive a message informing you of the change.

- Use of OB 61

  If the isochronous mode for PROFINET IO with OB 61 is activated in the original configuration in the STEP 7 project, it will be deactivated by the migration. The devices will still be imported. PROFINET IRT configurations with the option "high flexibility" without the use of OB 61 can be migrated.

CBA for IO controllers

If you have used the cyclical service CBA (Component Based Automation) in the initial project, it is deactivated during migration. You will receive a message informing you of the change.

Use of shared devices

If shared devices are configured in the initial project, they are removal during migration. You will receive a message informing you of their removal.

Transfer areas

If transfer areas for data exchange between the IO controller and I device are configured in the initial project, they are removed during migration. You will receive a message informing you when a transfer area is removed during migration.

Update groups for PROFINET IO

If necessary, also remove update groups from the STEP 7 project before you start the migration. If any update groups are still configured, then the migration can not be carried out.

I slaves and I devices

Only connected and consistent I slave and I device configurations can be migrated. If the configuration is inconsistent, then the configurations in question will be excluded from the migration.

4.6.5.3 PROFIBUS configurations

Isochronous PROFIBUS

It is possible to migrate isochronous PROFIBUS configurations. You should compile the project again after the migration, however, to rule out any possible inconsistencies. Also pay attention to slightly changed SDBs.

4.6.5.4 Connections

Connections from SIMATIC STEP 7 projects can usually be migrated if they are also supported by TIA Portal STEP 7 Professional V11.

Migratable types of connection

The following connection types can be migrated:

- S7 connection one-way
- S7 connection two-way
- Failsafe S7 connection
- TCP connection
- ISO-on-TCP connection
- ISO connection
- UDP connection
- E-mail connection
- FDL connection
- Point-to-point connection

FMS connections on the PROFIBUS are not accepted during the migration. Adapt the connections or modify the user program.

4.6.5.5 Multiprojects

Multiprojects in SIMATIC STEP 7

In SIMATIC STEP 7, you can organize projects into a multiproject if, for example, a project is very large or if several people are working on it. The subprojects may contain cross-project references, for example connections. All subprojects of a multiproject and the associated libraries are stored in the same directory.

Migration of parts of a multiproject

You can migrate the subprojects of a multiproject. To do this, select one of the subprojects during the migration. All of the devices and configurations contained in the respective subproject will be imported during the migration.

Observe the following when migrating a subproject:

- Cross-project connections

  Cross-project connections between subprojects are created as unspecified connections.
- Cross-project networking

  Information on networking of devices across project boundaries will be lost during the migration. Links between devices in the same subproject will be retained however.

Grouping a multiproject for the migration.

It is only possible to migrate an entire multiproject with all of its associated subprojects if you manually regroup the different subprojects prior to the migration. This is possible, for example, by copying the individual devices and pasting them back into a single project.

4.6.5.6 Messages

It is generally possible to migrate messages that you have created in SIMATIC STEP 7 projects.

Requirements

The prerequisite is that you have selected the CPU-wide assignment of message numbers in your SIMATIC STEP 7 project. If this is not the case, you must first switch the project to be migrated from the project-wide assignment of message numbers in SIMATIC STEP 7 to the CPU-wide assignment of message numbers.

Restrictions

Symbol-based messages cannot be migrated.

4.6.5.7 Reporting system errors

In principle, you can migrate system error messages that you have configured using SIMATIC STEP 7.

Restrictions

When migrating the "Report system errors" application, only the settings that were set by the user in the SIMATIC STEP 7 project will be migrated (e.g. basic settings, block numbers, block names).

The following elements are not migrated:

- SFM blocks
- SFM messages and the settings that were made to configure the message texts
- System text libraries

After migration, the settings can be manually adjusted once again. The missing elements will be recreated during the first compilation of the hardware configuration.

4.6.5.8 Migrating program blocks

General notes on migrating program blocks

You can generally migrate all blocks created in LAD, FBD, SCL, STL, and GRAPH. Please note the following:

Programs with absolute addressing

In the TIA Portal, symbolic operands are automatically declared for all absolute addresses. If absolute addressing was used in the STEP 7 program to be migrated, symbolic operands are also declared for the absolute addresses during the migration. This automatic declaration can lead to data type conflicts, particularly if the IEC check is activated in the TIA Portal. A data type conflict could occur, for example, if a 32-bit data value is declared as a DWORD type tag but a REAL data type tag is expected later in the program.

In this case, it is not enough to deactivate the IEC check. Instead, you must correct the declaration in the PLC tag table.

Symbolic names for blocks and user-defined data types (UDT)

In the TIA Portal, each block or UDT has a number and a name. It is therefore no longer necessary to declare symbolic names. If the migrated program contains symbol declarations for blocks or UDTs, they will be used as names after the migration.

Blocks from STEP 7 libraries

In the TIA Portal, standard functions and function blocks are not provided in libraries. Instead, they are available as instructions in the "Instructions" task card. The instructions are sorted by function and can be found under their symbolic name.

If calls of standard functions or function blocks are contained in the migrated program, they are replaced during the migration by the instructions that correspond to the original standard function or the original standard function block.

If the library block is no longer supported in the TIA Portal, you have the following options:

- Replace the library block with a compatible instruction. In this case, you will receive a message informing you that you have to compile the program after migration.
- If there is no compatible instruction, the block is migrated as user block. It is then available as know-how protected block in the folder "Program blocks" with the extension "_LF" (legacy function).

User-defined block libraries

User-defined block libraries are no longer available in the familiar form in the TIA Portal. However, you can migrate user-defined libraries by integrating these into a project prior to migration and then migrating the project. After this, you can copy these from this project in the TIA Portal and use them.

Instructions in a modified display

The display of some of the LAD, FBD, STL, SCL and GRAPH commands in the TIA Portal differs from the display in earlier versions of STEP 7. Thus, for example, the mathematical functions and the comparators are no longer specific for data types. Instead, there is a central instruction, which can be used for all types of data. The "ADD_I" command is no longer permitted, for example; the instruction "ADD" is used instead.

Some other commands also have a new display in the TIA Portal, e.g. edge commands, word logic operations, conversions, IEC timers, IEC counters, etc.

The commands will be converted for the new display during the migration.

Stricter IEC check

Stricter rules for checking data type compatibility will be used in the TIA Portal. In addition, errors that can lead to runtime errors are already detected during the syntax check. It is no longer permitted to write your own input parameters or to read your own output parameters in functions (FC). Observe the following rules to avoid syntax errors:

- Only use tags with compatible data types when transferring the parameters.
- In comparison instructions or arithmetic instructions, only use tags with compatible data types.
- You may not write to input parameters or read from output parameters.

For more information on the block interface and on data type conversion with IEC check, refer to "See also".

Peripheral access ID ":P"

In the TIA Portal, the access ID ":P" is used for direct addressing of the peripherals. The following notation is not permitted, for example:

```
%PEW3
```

The following notation is used instead:

```
%EW3:P //absolute display
MyTag:P //symbolic display
```

The accesses are converted into the new notation during the migration. However, symbolic names, which were declared to be peripheral tags in the original program, cannot be accepted. New declarations will be created instead. For additional information on peripheral access, refer to "See also."

No distinction is made between upper and lower case for jump marks

No distinction is made between upper and lower case for jump marks in the TIA Portal. If the source program contains jump labels that differ only through upper/lower case, these will be converted into unique jump labels. The log file provides information on the modified jump labels.

Migration of global data blocks

The display and handling of data values in data blocks is different in the TIA Portal than in SIMATIC STEP 7. In global data blocks which are not derived from a high-level object, for example a UDT, the tags are always assigned the default value of the data type as the default value, for example FALSE for the data type BOOL. This default value is not editable. If offline initial values were assigned in the declaration view, they are not imported during the migration. If you require user-specific default values in the program, use a global data block based on a PLC data type. You can assign user-specific default values for tag values in a PLC data type.

For additional information on data values, refer to "See also".

Migration of LAD/FBD/STL programs

LAD, FBD and STL blocks can run after the migration without being recompiled or reloaded.

Know-how protection

Blocks that were know-how protected before the migration remain know-how protected after the migration. Because the sources are not migrated, the know-how protection cannot be canceled. The blocks can thus not be opened or edited. It is possible, however, to load the blocks into the CPU and to run them.

The following options are available for disabling the a block's know-how protection:

- Prior to the migration, remove the KNOW_HOW_PROTECT attribute from the source and create a block without know-how protection from this. Then migrate this block.
- Import the source into the TIA Portal and create a block without know-how protection from this. Then use the "Edit > Know-how protection" menu command to provide the block with a password.

Switch-over from LAD/FBD to STL

As determined by the system, programs that were created in LAD or FBD and contain jump operations to subsequent networks will be displayed in STL after the migration. In the block properties, however, the language is still set as LAD or FBD.

In the block properties, change the program again to STL. Then reset the language to LAD or FBD.

Migrating GRAPH programs

Requirement

The prerequisite for migrating GRAPH blocks is to have the "S7-GRAPH" optional package, version 5.3 SP6 or later, installed on the original device.

GRAPH-specific block settings

The GRAPH-specific block settings have been significantly reduced in the TIA Portal. The following table gives an overview of how the original block settings will be transferred to the TIA Portal.

Setting in the initial project		Setting in the TIA Portal
FB parameter	Minimum	Existing parameters will be migrated
	Standard	
	Maximum	
	Definable	
Interface description	Minimized memory space	Generate DB with minimized memory space
	Structure fields	Individual structures are always created
	Individual structures	
Run capability	FC70/71	FC 73 if the option "Generate DB with minimized memory space" is active; otherwise FC 72
	FC72	
	FC73	
Criteria analysis in the DB		Setting not relevant in the TIA Portal
Skip steps		Skip steps
Acknowledgment of errors required		Acknowledge supervision errors
Synchronization		Always activated in the TIA Portal
Permanent processing of all interlocks in manual mode		Permanent processing of all interlocks in manual mode
Disable operating mode selection		Disable operating mode selection
Safeguarded switching behavior		Always activated in the TIA Portal
Warnings	None	Always activated in the TIA Portal
	Any	

Setting in the initial project	Setting in the TIA Portal
Activate messages	Activate messages
Messages with WR_USMSG	Messages in the TIA Portal always with ALARM_SQ/ALARM_S

Step name extension

Step name extensions are not supported in the TIA Portal. They are converted to step-specific text during the migration.

Compiling the migrated block

GRAPH blocks must be recompiled and reloaded after the migration.

The following errors may occur when compiling:

- Data type conflicts may occur due to the stricter IEC check. In this case, change the declaration.
- Since the "structure fields" setting for the interface is no longer available in the TIA Portal, interface elements can no longer be addressed with G7S[1].X, for example. Access to the element must therefore be corrected, e.g. to STEP1.X.

Changing the interface of the GRAPH block

The changed settings can lead to interface changes of the block. Therefore, it may be necessary to regenerate the instance DB or to update block calls.

Migrating SCL programs

The prerequisite for migrating SCL blocks is to have the "S7-SCL" option package, version 5.3 SP5 or later, installed on the original device.

SCL blocks must be recompiled and reloaded after the migration.

Basic procedure for the migration

A complete migration of SCL blocks is only carried out if the associated sources exist in the initial project.

The table below gives you an overview of the basic procedure.

Existing in the initial project	Existing after migration
SCL blocks with source	Editable SCL blocks
Know-how protected SCL blocks with source	Editable SCL blocks. After the migration, the blocks no longer have know-how protection but can be re-protected, if necessary.
SCL blocks without source	Know-how protected SCL blocks
Know-how protected SCL blocks without source	Know-how protected SCL blocks

SCL-specific compiler options

Only the compiler options that are defined directly in an SCL source are adopted as block properties in the TIA Portal during migration. If no compiler options are defined in the original SCL source, the options in the properties of the migrated block are deactivated.

Compiler options defined as settings in the SCL Editor or in an SCL compile control file are not migrated.

The following table gives an overview of the compiler options that are transferred as block property to the TIA Portal.

Compiler option in the SCL source	Block property in the TIA Portal
scl_monitorarraylimits	Check ARRAY limits
scl_createdebuginfo	Create extended status information
scl_setokflag	Set ENO automatically

Symbolic constants as ARRAY limits

In the TIA Portal, it is not possible to use symbolic constants as ARRAY limits. For example, the following notation would not be permitted:

```
ARRAY [min..max]
```

Only direct value inputs are possible as ARRAY limits, e.g.:

```
ARRAY [1..5]
```

During the migration, symbolic ARRAY limits are converted into direct values. For additional information on symbolic constants, refer to "See also".

New EN/ENO mechanism

SCL uses the EN/ENO mechanism of the TIA Portal. For this reason, all usages of the OK flag are replaced by ENO during the migration. The points where ENO was used in the original program are highlighted. You must check these points after the migration and adapt them to the new mechanism.

For additional information on the EN/ENO mechanism of the TIA Portal, refer to "See also".

Operator "DIV"

The "DIV" operator is no longer available in the TIA Portal. All usages of "DIV" will be converted to the standard notation "/" during the migration.

Nested ARRAYs

In the TIA Portal it is not possible to nest ARRAYs. The following declaration is not permitted, for example:

```
ARRAY[1..5] OF ARRAY[0..3] OF INT
```

Nested ARRAYs are converted into multi-dimensional ARRAYs during migration. The example would look as follows after the migration:

```
ARRAY[1..5, 0..3] OF INT
```

Declaration of jump labels (LABEL)

The declaration of jump labels is not possible in the TIA Portal. The following declaration would not be accepted from the initial project, for example:

```
LABEL
LABEL1, LABEL2, LABEL3 ;
END_LABEL
```

Set jump labels, however, will be retained in the program code and can be used for GOTO operations.

Declaration of symbolic constants in the block interface

In the TIA Portal, symbolic constants cannot be declared in the block interface. If symbolic constants are declared in the original program, they will be converted into global constant declarations and will be available in the PLC tag table. Name conflicts are handled as follows during conversion:

- If both constants have the same value, a global constant will be created with this value.
- If the values differ, then the second constant will be renamed. The renaming will be consistently carried out at all points of use.

Indexed peripheral accesses

In the TIA Portal, the syntax with rounded parentheses is used for indexed peripheral accesses. The following notation is not permitted, for example:

```
PEB[1]
```

The following notation is used instead:

```
EB(1):P
```

The accesses are converted into the new notation during the migration. For additional information on peripheral access, refer to "See also."

Indexed memory accesses

In the TIA Portal, the syntax with rounded parentheses is used for indexed memory accesses. The following notation is not permitted, for example:

```
EB[2]
```

The following notation is used instead:

```
EB(2)
```

The accesses are converted into the new notation during the migration. For additional information on addressing, refer to "See also."

Indexed access to data blocks

In the TIA Portal, the syntax with rounded parentheses is used for indexed data block accesses. The following notation is not permitted, for example:

```
DB100.DW[5]
```

The following notation is used instead:

```
DB100.DW(5)
```

The accesses are converted into the new notation during the migration. For additional information on addressing, refer to "See also."

Absolute access to data blocks

For an absolute access, the absolute designator of the data block must be used. Access using the symbolic designator is not permitted in the TIA Portal.

The following notation is not permitted, for example:

```
DB100.DW3
```

The following notation is used instead:

```
%DB100.DW3
```

During the migration, the marker "%" will be added for a detected absolute data block access. For additional information on addressing, refer to "See also."

Logarithmic function "EXPD"

The logarithmic function "EXPD" is no longer available in the TIA Portal. All usages of "EXPD" are converted to the standard notation "10**" during the migration.

Floating point numbers - exponential display

The exponential notation of floating point numbers without a decimal point is no longer permitted in the TIA Portal. The following notation is not permitted, for example:

```
3E10
```

The following notation is used instead:

```
3.0E10
```

During the migration, all usages of "3E10" will be converted to the standard notation "3.0E10". For additional information on floating point numbers, refer to "See also".

Blocks from STEP 7 libraries

The functions FC1 to FC40 from the STEP 7 classic library "IEC standard functions" are no longer available in the TIA Portal. Calls to the standard functions are converted to calls to the corresponding extended instructions during the migration. If there is no clear conversion possibility, a system error is issued.

In this case, change the SCL block after the migration and use SCL instructions or operators instead of IEC standard functions.

Example:

Use S5TIME_TO_TIME instead of S5TI_TIM (FC 33)

```
"TAG_TIME" := S5TIME_TO_TIME ("TAG_S5TIME");
```

Use the relational operator <> instead of NE_DT (FC 9):

```
IF #D1 <> #D2 THEN "MyOutput" : = 10;

END_IF;
```

4.7 Migrating WinCC flexible projects (Basic)

4.7.1 Basics (WinCC flexible)

4.7.1.1 Migration (WinCC flexible)

Introduction

You can continue to use projects in WinCC from WinCC flexible. The following version of WinCC flexible is supported:

- WinCC flexible 2008 SP2

The following sections describe the operating devices that are supported and the required conditions for a successful migration.

Projects from ProTool and from earlier versions of WinCC flexible cannot be migrated directly to WinCC. If you wish to continue to use such projects in WinCC, you must first migrate them to a supported version of WinCC flexible.

Supported HMI devices (WinCC flexible) (Page 120)

Migration of data types (WinCC flexible) (Page 139)

4.7.1.2 Basics on migration (WinCC flexible)

Introduction

During migration, the project data from a WinCC flexible project are converted to the new format of WinCC. The data will not be evaluated to see if they are consistent in the project you want to migrate. If errors or warnings are output in a source project during compilation, these will not be resolved as part of the migration. This means you should be able to compile the project without errors prior to migration. Note the scope of a project during migration. The features of WinCC apply for migration. See Engineering system (Page 2848) for additional information.

Unique object names

The objects are clearly identified by the folders in which they are contained in WinCC flexible. Screen elements in groups are clearly identified by the group name.

In WinCC, an object name must be unique within an HMI device. The name of screen elements must be unique within a screen.

The uniqueness of the name is verified during migration. If a name is not unique according to the new rule, the object in question will be renamed. A renamed object will receive the suffix "#Mign", where "n" stands for a sequential number.

Example:

In WinCC flexible, tags located in different folders may have the same name. In WinCC, the tag name must be unique on the configured HMI device. This means tags with the same name from different folders will be renamed during migration.

Tags are renamed as follows:

Before migration	After migration
Folder_1/Tag_1	Folder_1/Tag_1
Folder_1/Tag_2	Folder_1/Tag_2
Folder_2/Tag_1	Folder_2/Tag_1#Mig1
Folder_2/Tag_2	Folder_2/Tag_2#Mig1
Folder_3/Tag_1	Folder_3/Tag_1#Mig2
Folder_3/Tag_2	Folder_3/Tag_2#Mig2

Affected objects

The following objects are renamed if necessary:

- Screens
- Screen objects
- Recipes
- Tags

Cancelling migration

The migration is cancelled in the following cases:

- If the project to be migrated is opened in the engineering system or in Runtime.
- If not enough memory space is available on the hard disk to create a a copy for migration of the project.
- If the migration cannot address the project database due to problems with the installed SQL-Server.
- If the migration cannot address the project database due to missing user authorization.
- If you select the "*.hmi" file for the migration in an integrated project. You must select the "*.s7" file for the migration in an integrated project.
- If the project was created with a version not supported by the migration.

Saving the project in the migration format

You do not have to execute the migration of a WinCC flexible project completely on the PC on which the project is available. You can prepare the migration by saving the project in the migration format. The migration tool is available for saving a WinCC flexible project in the migration format. The migration tool exports the engineering data from the WinCC flexible project and saves the data in the migration format "*.AM11".

For the actual migration, copy the data in the migration format to a PC on which the TIA-Portal is installed.

See the section "Auto-Hotspot" for more information on the migration tool.

See also

Engineering system (Page 2848)

4.7.1.3 Projects from Migrating WinCC flexible projects (WinCC flexible)

Introduction

When you migrate a project, data from a WinCC flexible project is loaded into a new project for WinCC. A new project is therefore created automatically for project migration. You cannot migrate to an existing project.

The migration can be started in both the Portal view and the Project view.

You should only migrate a project in a newly started TIA portal.

Information on the migration of integrated project can be found in the Chapter Migrating integrated projects (WinCC flexible) (Page 135).

If you only want to save the project in migration format, you can use the migration tool. See Basics on migration (WinCC flexible) for additional information.

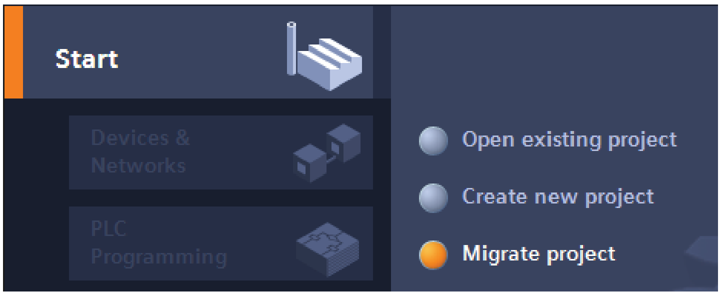
Requirement

- A project from WinCC flexible is available.
- The project is not open in WinCC flexible.
- The TIA portal is newly started.

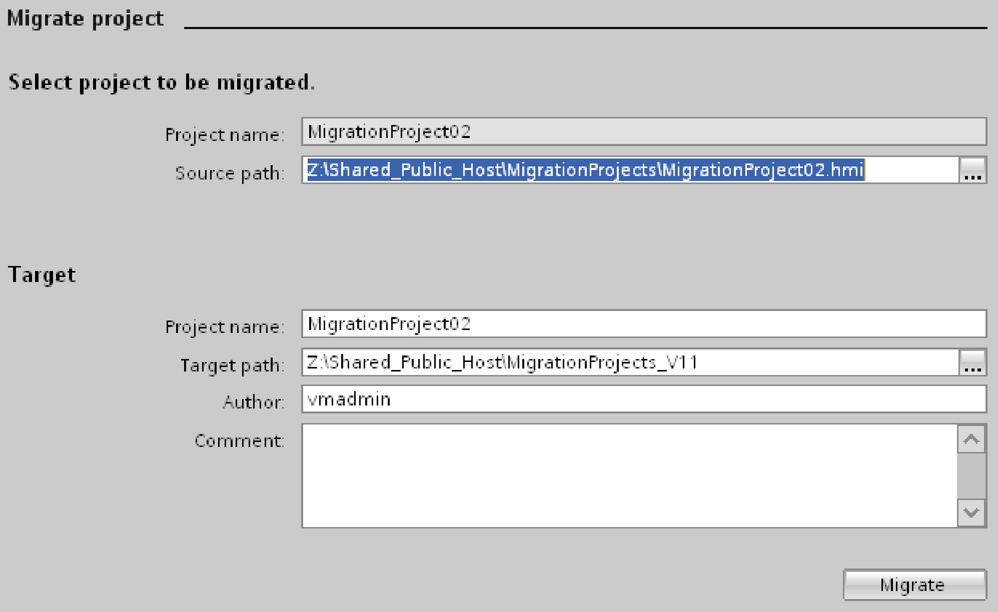
Procedure

Migrate a project in the Portal view as follows:

1. Select the action "Start > Migrate Project".



2. In the "Source path" box, navigate to the project you want to migrate.



Migrate project

Select project to be migrated.

Project name: MigrationProject02

Source path: Z:\Shared_Public_Host\MigrationProjects\MigrationProject02.hmi

Target

Project name: MigrationProject02

Target path: Z:\Shared_Public_Host\MigrationProjects_V11

Author: vmadmin

Comment:

3. Select the WinCC flexible project file "*.hmi".
4. Change the information for the project to be created, if necessary. For example, change the project name or project path. The data to be migrated is created in the new project.
5. Click "Migrate".
   A new project is created and migration of the data is started:
   - The Project view opens.
   - The progress of the migration is shown in a migration window.
   - Warnings and errors about the migration process are displayed in the Inspector window under "Info > General".
   - All information about the migration is saved in a log file.
   - A message is displayed upon completion of the migration. The message contains a link that you can use to open the log.
6. Once migration is completed, save the project.

When migration is complete, you will find a newly created device for each migrated HMI device in the project tree. These devices contain the migrated data, such as screens, alarms and tags.

Opening the migration log at a later point in time

The migration log is saved together with the migrated project. You can view the log at a later point in time. Open the log as follows:

1. Select the project in the project tree.
2. Select the "Properties" command in the shortcut menu.
3. Click "Project History" in the "Properties" dialog.
4. Click on the log file.
   The migration log opens.

See also

Migrating integrated projects (WinCC flexible) (Page 135)

4.7.1.4 Compiling and loading a migrated project (WinCC flexible)

Compiling a migrated project

Once you have successfully migrated a WinCC flexible project, you need to recompile it before loading it to the HMI device. The project will only compile successfully if it was capable of error-free compiling prior to migration.

If errors occur during compilation of the migrated project, they have to be eliminated.

Once compiling is successfully completed, load the project to the HMI device.

Settings for download to the HMI device

The settings for loading the HMI device are not included in the migration. Once you have migrated the project, you must configure the settings for loading.

Select the HMI device in the project tree and select "Loading in device > Software (complete loading)" from the shortcut menu.The dialog "Advanced Loading" is opened. Configure the required settings for the interface. Click the "Load" button. The project is recompiled and the dialog "Load preview" is opened.

Expand the "Overwrite" entry and verify the settings for the following options:

- Would you like to overwrite the existing user administration data from this device
- Would you like to overwrite the existing recipe data on HMI system

Configure the options as you want to use them in the project in the future. Subsequently, load the project to the HMI device.

4.7.2 Migrating engineering data (WinCC flexible)

4.7.2.1 Supported HMI devices (WinCC flexible)

Introduction

Note that WinCC only supports the following HMI device types when migrating projects from WinCC flexible:

- KTP400 Basic mono PN
- KTP400 Basic mono PN Portrait
- KTP600 Basic DP
- KTP600 Basic DP Portrait
- KTP600 Basic PN
- KTP600 Basic PN Portrait
- KTP600 Basic mono PN
- KTP600 Basic mono PN Portrait
- KTP1000 Basic DP
- KTP1000 Basic PN
- TP1500 Basic PN

WinCC only supports the functions provided by these HMI device types.

If your WinCC flexible project contains an HMI device that is not supported by WinCC, then the migration process will abort. To migrate the project, you must change the HMI device in WinCC flexible to a HMI device type supported by WinCC.

There may be some functions in a WinCC flexible project that are not supported by a Basic Panel, for example, because the device type has been switched. These unsupported functions are not migrated.

Adaptations before migration

If the HMI device has changed in the project being migrated, the project needs to be recompiled before migration. The compilation process will adjust the size of the screens and screen elements.

Migrating libraries (WinCC flexible) (Page 131)

Migration tags (WinCC flexible) (Page 125)

Changes of values of object properties by the migration (WinCC flexible) (Page 124)

4.7.2.2 Object support during migration (WinCC flexible)

Introduction

When migrating projects from WinCC flexible, all configuration data involving an HMI device supported by WinCC will be migrated. Basically, all object types and functions that are available and can be mapped to the new project environment will be fully migrated.

Some global object types are not migrated, for example, dictionaries and global libraries.

Supported object types

The following object types are supported for migration:

- Animations
- Scheduler
- User administration
- Area pointer
- Screens
- Screen template
- Data types
- Function lists
- Graphics lists
- Display and operating elements
  Migration supports all display and operating elements available on the supported HMI devices.
- Alarms
- Alarm classes
- Alarm groups
- Project library
- Project languages
- Recipes
- Runtime languages
- Runtime scripting
- System functions
- Texts
- Text lists
- Tags
- Connections

Unsupported object types

The following object types are not supported by migration:

- Global libraries
- Dictionaries
- Project versions
- Change log

Migration of the screen template

WinCC offers an extended concept for working with screen templates. WinCC offers a global screen and several templates for each device. During migration of a template from WinCC flexible, the objects contained there and the properties configured in the template are migrated to different templates of WinCC.

The following objects are migrated to the "global screen" of WinCC:

- Alarm window
- Alarm indicator
- Function keys of HMI devices with function keys

All other objects and properties are migrated to a template of WinCC.

The connection of the objects and properties to the respective template is automatically adapted.

Migration of system functions

The names of some system functions have changed in WinCC.

System functions which have changed their names are renamed.

This concerns the following system functions:

Function name in WinCC flexible	Function name in WinCC
IncreaseValue	IncreaseTag
DecreaseValue	DecreaseTag
SetValue	SetTag

See also

Supported HMI devices (WinCC flexible) (Page 120)

Changes of values of object properties by the migration (WinCC flexible) (Page 124)

4.7.2.3 Changes of values of object properties by the migration (WinCC flexible)

Introduction

The standardization of object properties from WinCC V7 and WinCC flexible requires changes to the object properties during the migration process. The migration calculates the changes in such a way that the representation of the objects after migration is the same as prior to migration. Changes made during migration result in different units of measurements and values in the configuration for some object properties.

Migrating the font settings of an object

In WinCC V7 and WinCC flexible, the unit of measurement "point" is used to denote the size of the fonts used for an object. In WinCC, the unit of measurement "pixel" is used to denote the size of the fonts used for an object. During migration, the font size is converted accordingly to ensure that the representation of the font is the same size at zoom level 100%. The different units of measurement result in changes to the numerical values for the font sizes after migration.

Example:

Font style before migration	Font style after migration
Arial 10 points	Arial 13 pixels
Arial 16 points	Arial 21 pixels
Tahoma 10 points	Tahoma 13 pixels
Tahoma 16 points	Tahoma 21 pixels

Migration of object margins

In WinCC flexible, some objects permit the entry of values <0 and >127 for setup of the object margins for the configuration of the representation. In WinCC, the range of values for object margins is limited to values between 0 and 127. The migration changes values <0 to the value "0" and values >127 to the value "127".

See also

Supported HMI devices (WinCC flexible) (Page 120)

Object support during migration (WinCC flexible) (Page 122)

4.7.2.4 Migration tags (WinCC flexible)

Introduction

You need to make some special considerations when migrating tags. The following aspects should be distinguished:

- Migrating data types of tags
- Migrating internal tags
- Migrating external tags
- Tag names

Migrating data types

WinCC features some other data types and uses different data type names than WinCC flexible. When migrating a relevant tag, the data type from WinCC flexible is mapped to the corresponding data type in WinCC. You can find additional details on this in the section "Migration of data types (WinCC flexible) (Page 139)".

Migrating tags

Tags are always fully migrated. Only the data type names and tag names may change due to migration.

Migrating names of tags

In WinCC flexible, tags located in different folders can have the same name. In WinCC, the tag name must be unique on the configured HMI device. This means tags with the same name from different folders will be renamed during migration. You can find additional details on this in the section "Basics on migration (WinCC flexible) (Page 115)".

See also

Basics on migration (WinCC flexible) (Page 115)

Migration of data types (WinCC flexible) (Page 139)

Supported HMI devices (WinCC flexible) (Page 120)

4.7.2.5 Migration of alarm classes and alarm groups (WinCC flexible)

Changing the names of alarm classes

In contrast to WinCC flexible, the names of the predefined alarm classes are not dependent on the user interface language currently in use. During migration, the names of the alarm classes are assigned as follows:

WinCC flexible	WinCC
Error	Alarms
System	System
Warnings	Events

The names of the alarm classes can be changed as necessary after migration.

Migrating alarm groups

Migration will migrate only those alarm groups actually in use.

Alarm groups with an ID from 1-31 will be migrated 1:1.

A corresponding alarm group is created in WinCC for each alarm class in the system. These alarm groups created by the system are assigned IDs beginning with the number 32 and consecutively incremented. The 4 pre-defined message classes in every WinCC project are automatically given IDs 32-35 by their alarm groups. Additionally created alarm group and an additional ID is assigned to each user-defined alarm class. Therefore, the IDs for alarms groups with IDs > 31 may be changed after migration. This step also changes the assignment of the alarm group names to the IDs.

Example:

In the example, you can see the assignment of the IDs in WinCC for the migration.

Alarm groups	ID in WinCC flexible	ID in WinCC	
Alarm group 1-16	1-16	1-16	Default for alarm groups from system alarms
Alarm group 17-31	17-31	17-31	Custom alarm groups
		32-35	Default in WinCC for alarm groups of predefined alarm classes.
Alarm group 32	32	36	Changed assignment of ID to alarm group in WinCC
Alarm group 33	33	37	Changed assignment of ID to alarm group in WinCC

Also note:

When migrating alarm groups that supposedly have the same group name, the migration adapts the name. This occurs, for example, when a group name contains a space at the end of the name. The migration deletes all existing spaces at the end of names. If two groups obtained the same group names due to this deletion, the migration adds the suffix "# Mign" to the group name of the following alarm groups, where "n" stands for a sequential number.

Example:

The following alarm groups exist in WinCC flexible:

"AlarmGroup_18"

"AlarmGroup_18 " - group name contains one space

"AlarmGroup_18 " - group name contains two spaces

"AlarmGroup_18" is the alarm group with the highest number.

Result after migration:

"AlarmGroup_18"

"AlarmGroup_18#Mig1"

"AlarmGroup_18#Mig1.1"

Changing the names of alarm classes

In contrast to WinCC flexible, the names of the predefined alarm classes are not dependent on the user interface language currently in use. During migration, the names of the alarm classes are assigned as follows:

WinCC flexible	WinCC
Error	Errors
System	System
Warnings	Warnings

The names of the alarm classes can be changed as necessary after migration.

Display of ALARM_S messages and SIMATIC SFM messages

In WinCC flexible you can activate the display classes for ALARM_S messages in integrated projects. In WinCC flexible, you activate the display of SIMATIC SFM messages via a separate setting. The separate setting for activating the display of SIMATIC SFM messages is not required in WinCC. You control the display of SIMATIC SFM messages, and also the display of ALARM_S messages in WinCC only by activating the corresponding display class.

The changed concept may cause the display of messages to change following migration.

If all the display classes for ALARM_S messages are activated and the display of SIMATIC SFM messages is deactivated in the WinCC flexible project , ALARM_S messages and SIMATIC SFM messages are displayed following migration.

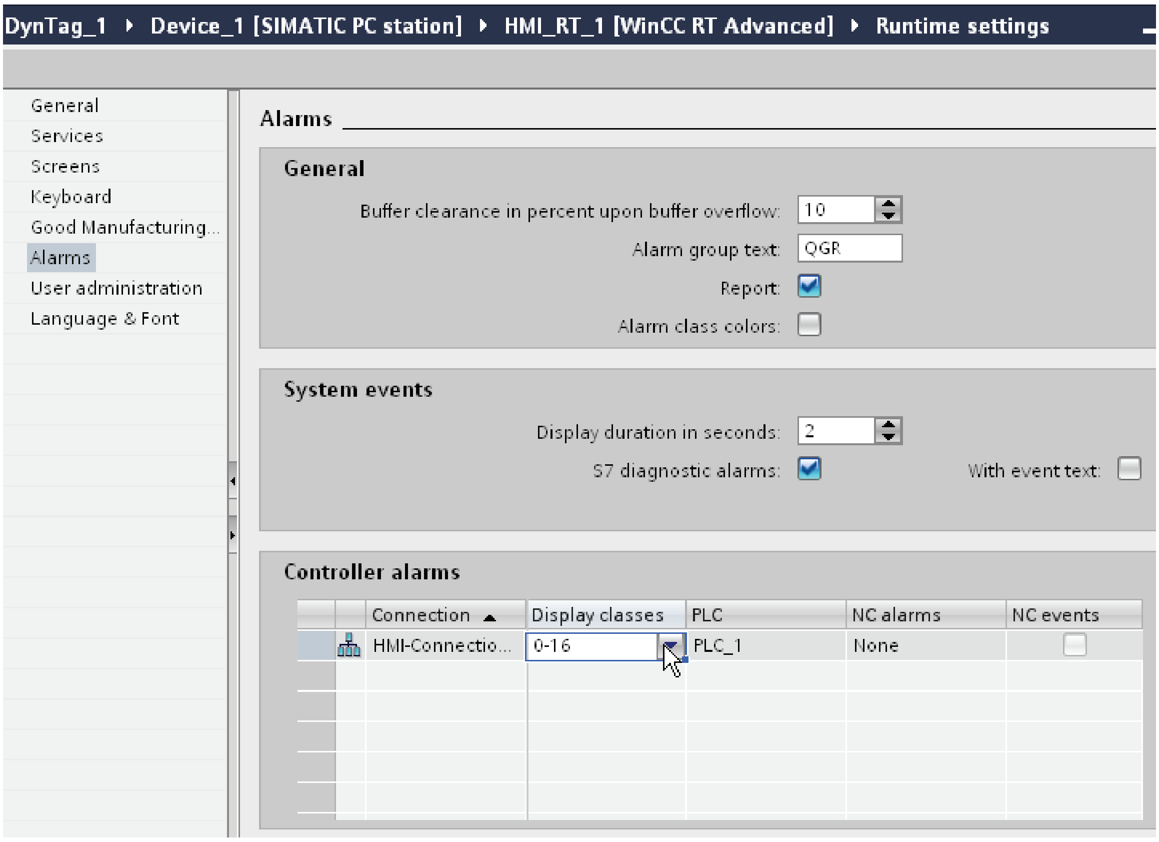
To ensure that only ALARM_S messages are displayed following migration, you have to assign the SIMATIC SFM messages to an unused display class after migration to STEP 7. You then have to deactivate this display class in WinCC.

If all the display classes for ALARM_S messages are deactivated and the display of SIMATIC SFM messages is activated in the WinCC flexible project , ALARM_S messages and SIMATIC SFM messages are not displayed following migration.

To ensure that only SIMATIC SFM messages are displayed following migration, you have to assign the SIMATIC SFM messages to an unused display class after migration to STEP 7. You then have to activate this display class in WinCC.

The display class is dependent on the settings in STEP 7. The default setting for SIMATIC SFM messages in Step 7 is the display class "0". To activate the display in WinCC, the display class "0" must be activated.

You activate the display class in WinCC in the Runtime settings of the respective HMI device in the "Messages" category.



Alarms

General

Buffer clearance in percent upon buffer overflow: 10

Alarm group text: QGR

Report: ☑

Alarm class colors: □

System events

See also

Supported HMI devices (WinCC flexible) (Page 120)

4.7.2.6 Migration of language-dependent contents (WinCC flexible)

Introduction

WinCC offers the same options for configuring projects in different languages as those available in WinCC flexible. All languages supported by WinCC are included in the migration of a project.

Migrating language-dependent content

The following language-dependent content is migrated:

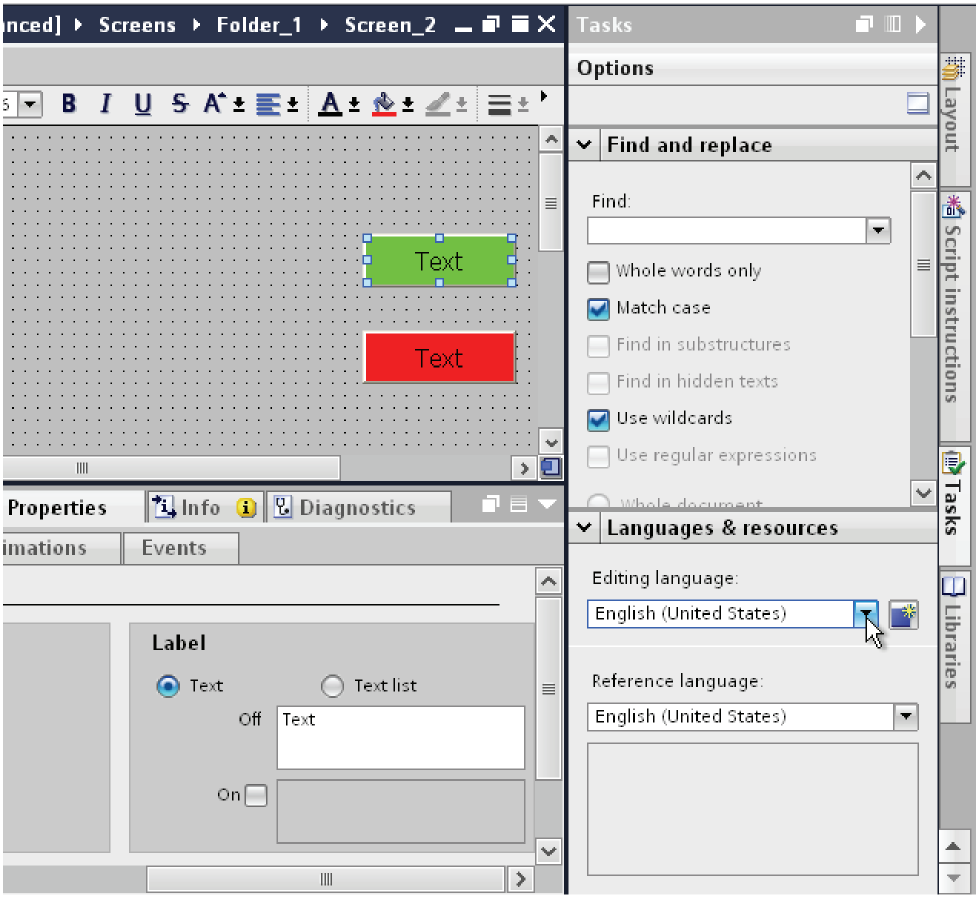
- Project languages
- Project texts
- Fonts for display in runtime
- Language-dependent graphics

You need to consider the following when migrating language-dependent content:

- The operating system on the PC performing the migration must support the project languages used in the project.
- The fonts used for runtime display must be installed on the PC performing the migration.
- Dictionaries are not supported by the migration.

Editiing language of integrated projects following migration

During migration of an integrated project, the project components to be migrated from STEP 7 and WinCC flexible also bring their respective settings for the editing language. In WinCC there is only one editing language for all project components. Migration activates for the mgrated project the editing language which was set in STEP 7 prior to migration. If this setting is not the same as the setting from WinCC flexible, the configured texts are no longer visible in WinCC. No text is displayed at the usage locations, or only the entry "Text" can be seen. To make the texts visible, you must change the editing language. Click the "Tasks" taskcard at the right-hand edge of the TIA portal and select the correct editing language in the "Language & Resources" area.



Find and replace

Find:

□ Whole words only
☑ Match case
□ Find in substructures
□ Find in hidden texts
☑ Use wildcards
□ Use regular expressions

Languages & resources

Editing language: English (United States)

Reference language: English (United States)

Label

● Text ○ Text list

Off: Text

On □

Unsupported languages

The migration of language-dependent content depends on whether or not WinCC supports the respective language.

If a project only contains project languages not supported by WinCC, the project will not be migrated.

If a project contains supported and unsupported project languages, only the supported languages will be migrated. The editing language and reference language are set to a supported language.

The following languages are not supported by WinCC:

- Arabic
- Hebrew
- Dhivehi
- Gujarati
- Kannada
- Tamil
- Telugu
- Urdu
- Punjabi
- Persian
- Syrian

See also

Supported HMI devices (WinCC flexible) (Page 120)

4.7.2.7 Migrating libraries (WinCC flexible)

Introduction

You need to consider two different cases when migrating from libraries:

1. Migrating a project library
2. Migrating a global library

Migrating a project library

A project library is stored together with the project data in the project file. For this reason, a project library is migrated with the same restrictions as the project data.

Migrating a global library

Global libraries are not supported by the migration. The library objects used in the project will be migrated, however. The library objects are copied when used in the project and then no longer have a connection to the library.

To migrate a global library, you must copy or move the objects contained in the library to the project library. The objects are then included in the migration. In WinCC, you move the migrated objects to a new global library that is created. You can copy or move both individual objects or entire library categories.

See also

Supported HMI devices (WinCC flexible) (Page 120)

4.7.3 Migrating runtime data (WinCC flexible)

4.7.3.1 Migrating runtime data (WinCC flexible)

Introduction

When migrating a project, only the configuration data will be migrated. The runtime data are not affected. You need to update the runtime data following migration.

The runtime data consists of the following:

- Runtime project

  The runtime project contains the compiled project data.

- Recipe data and user administration

  The recipe data and user administration are data that can be changed in runtime.

Migrating runtime data

You update the runtime project by compiling the project in WinCC again and loading it to the HMI device.

If the recipe data and user administration were changed in runtime, you need to back up this information from the HMI device before you load the migrated project. You can then load the migrated project to the HMI device. Finally, you load the saved recipe data and user administration back to the HMI device. You can find additional details on this in the section "Auto-Hotspot".

See also

Migration (WinCC flexible) (Page 114)

Backing up recipe data and user administration (WinCC flexible) (Page 133)

Restoring recipe data and user administration (WinCC flexible) (Page 134)

4.7.3.2 Backing up recipe data and user administration (WinCC flexible)

Introduction

To continue using the recipe data and user administration in a migrated project, you first need to back up this data from the HMI device. Then load the data into the migrated WinCC project. Use ProSave to back up the data.

Requirement

- The WinCC flexible project is running on the HMI device in Runtime.
- The HMI device is connected to a PC on which ProSave is installed.

Procedure

Proceed as follows to back up the recipe data and user administration:

1. Start ProSave.
2. Select the device type and the connection parameters in the "General" tab.
3. Open the "Backup" tab.
4. Select the "Recipes from the device memory" entry in the "Data type" box.
   Do not select "Complete backup" because otherwise you will not be able to select separately when restoring the recipe data.
5. Navigate to the desired location in the "Save as" box and click "Start Backup".
   The recipe data are saved.
6. Select "User administration" in the "Data type" box and click "Start Backup".
   The user administration is saved.

For additional information refer to the online help for ProSave.

Alternative procedure

ProSave is automatically installed with WinCC flexible. The entire functional range of ProSave is available on the configuration PC within WinCC flexible via the menu command "Project > Transfer".

Alternatively, you can back up the recipe data and user administration via the ProSave integrated in WinCC flexible. Start WinCC flexible and select the menu command "Project > Transfer > Backup". Back up the recipe data and user administration as described in steps 4-6.

See also

Migrating runtime data (WinCC flexible) (Page 132)

Restoring recipe data and user administration (WinCC flexible) (Page 134)

4.7.3.3 Restoring recipe data and user administration (WinCC flexible)

Introduction

To continue using saved recipe data and user administration after the migration, you first need to compile the migrated project and load it to the HMI device. You can then transfer the saved data to the HMI device. Use ProSave to restore the data.

Requirement

- The migrated project has been transferred to the HMI device and is running in runtime.
- The HMI device is connected to a PC on which ProSave is installed.

Procedure

Proceed as follows to load the saved recipe data and user administration to the HMI device:

1. Start ProSave.
2. Select the device type and the connection parameters in the "General" tab.
3. Open the "Restore" tab.
4. Navigate to the location of the saved recipe data in the "Opening..." box and select the file.
5. Click "Start Restore".
   The recipe data will be transferred to the HMI device..
6. Repeat steps 4-5 to restore the user administration.
   The user administration will be transferred to the HMI device.

For additional information refer to the online help for ProSave.

Alternative procedure

ProSave is automatically installed with WinCC. The entire functional range of ProSave is available on the configuration PC within WinCC flexible via the menu command "Project > Transfer".

You can also restore the recipe data and user administration via the ProSave integrated in WinCC. Start WinCC and select the menu command "Online > Device maintenance > Restore". Restore the recipe data and user administration as described in steps 4-6.

See also

Migrating runtime data (WinCC flexible) (Page 132)

Backing up recipe data and user administration (WinCC flexible) (Page 133)

4.7.4 Migrating integrated projects (WinCC flexible)

4.7.4.1 Migrating integrated projects (WinCC flexible)

Introduction

The controllers and HMI devices contained in a project integrated in STEP 7 are linked together by the configuration. The configuration data of WinCC flexible and STEP 7 are also connected. When an integrated project is migrated, the complete project will be migrated with components from WinCC flexible and STEP 7. The connections remain intact.

Migrating an integrated project

When migrating an integrated project, the same requirements apply for the WinCC flexible component as those for the migration of a non-integrated WinCC flexible project. The objects and properties contained in the WinCC flexible component must be supported by WinCC, for example, the HMI device or the communication driver. The "Online" property must be activated on the configured connection. A connection with deactivated "Online" property is not migrated.

In addition to the requirements for the WinCC flexible component, there are also requirements for the STEP 7 component of the integrated project. The objects and properties contained in the STEP 7 V5.4 SP5 or V5.5 component must be supported in STEP 7. For detailed information, refer to the documentation for STEP 7.

To fully migrate an integrated project and then edit it, the following components must be installed on the PC performing the migration:

- STEP 7 V5.4 SP5 or STEP 7 V5.5
- WinCC
- STEP 7

If you only want to save the project in migration format, you can use the migration tool. See Basics on migration (WinCC flexible) (Page 115) for additional information.

An integrated project is always fully migrated. If you only want to migrate the WinCC flexible project it contains, you need to separate it from the STEP 7 project before the migration. To separate the project from the integrated form, open the project in STEP 7 V5.4 SP5 or V5.5. Open the WinCC flexible project in the SIMATIC Manager. The project is opened with WinCC flexible. In WinCC flexible, select the menu command "Project > Copy project from STEP 7". WinCC flexible saves a non-integrated copy of the project.

Basics on migration (WinCC flexible) (Page 115)

4.7.4.2 Migrating an integrated project (WinCC flexible)

Introduction

When migrating an integrated project, the components from both the WinCC flexible project and the STEP 7 project will be migrated. This means you need to select the project file with the file extension "*.s7p" for migration. During migration, the data is copied from the existing project and migrated to a new project. You cannot migrate to an existing project.

The migration can be started in both the Portal view and the Project view.

You should only migrate a project in a newly started TIA portal.

If you only want to save the project in migration format, you can use the migration tool. See Basics on migration (WinCC flexible) (Page 115) for additional information.

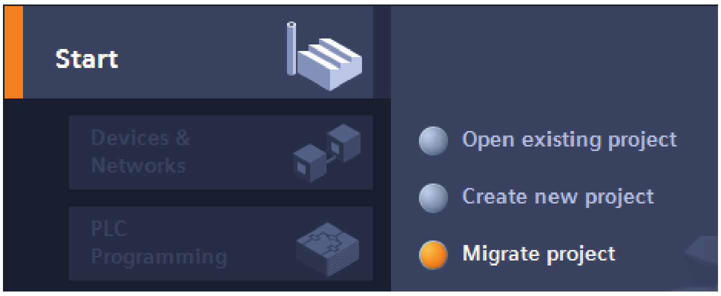
Requirement

- STEP 7 V5.4 SP5 or STEP 7 V5.5 and all add-on packages used are installed.
- STEP 7 and all add-on packages used are installed.
- The TIA portal is newly started.
- No project is open in WinCC.
- An integrated project is available.
- The integrated project is not open.

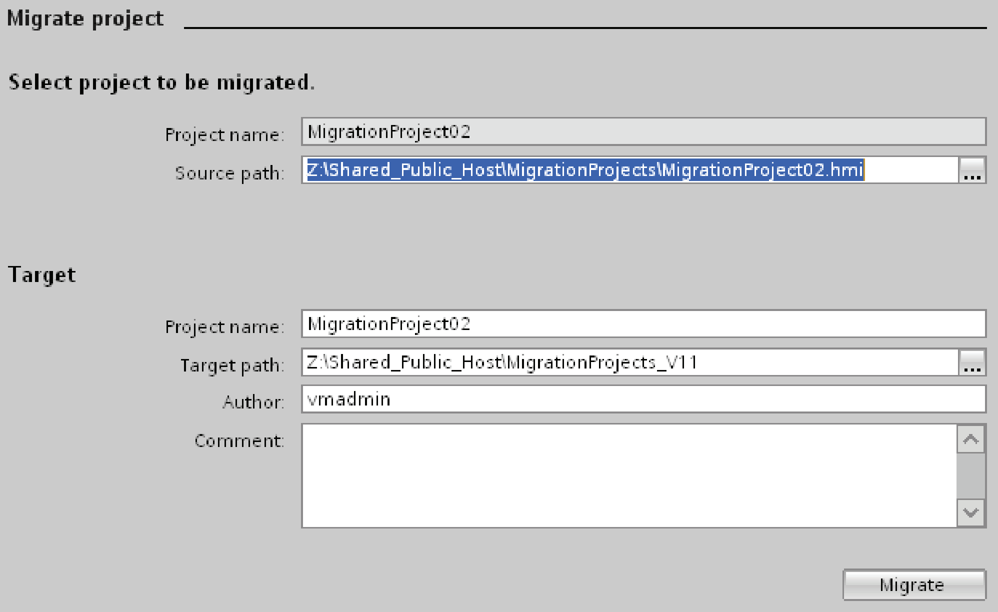
Procedure

Proceed as follows to migrate an integrated project in the Portal view:

1. Select the action "Start > Migrate Project".



2. In the "Source path" box, navigate to the project you want to migrate.



Migrate project

Select project to be migrated.

Project name: MigrationProject02

Source path: Z:\Shared_Public_Host\MigrationProjects\MigrationProject02.hmi

Target

Project name: MigrationProject02

Target path: Z:\Shared_Public_Host\MigrationProjects_V11

Author: vmadmin

Comment:

3. Select the "*.s7p" project file.
4. Change the information for the project to be created, if necessary. For example, change the project name or project path. The data to be migrated is created in the new project.
5. Click "Migrate".
   A new project is created and migration of the data is started:
   - The Project view opens.
   - The progress of the migration is shown in a migration window.
   - Warnings and errors about the migration process are displayed in the Inspector window under "Info > General".
   - All information about the migration is saved in a log file.
   - A message is displayed upon completion of the migration. The message contains a link that you can use to open the log.
6. Once migration is completed, save the project.

Once the migration is complete, you will find a newly created device for each migrated HMI device and controller in the project tree. These devices include the migrated data.

Opening the migration log at a later point in time

The migration log is saved together with the migrated project. You can view the log at a later point in time. Open the log as follows:

1. Select the project in the project tree.
2. Select the "Properties" command in the shortcut menu.
3. Click "Project History" in the "Properties" dialog.
4. Click on the log file.
   The migration log opens.

4.7.5 Reference (WinCC flexible)

4.7.5.1 Migration of data types (WinCC flexible)

Introduction

To harmonize the data types used by controllers and HMI systems, some types of internal HMI tags are renamed. The naming takes place in accordance with IEC conventions. Because only the names change, there are no changes to the internal tags for the configuration.

The following table describes the mapping of data types from WinCC flexible to the data types in WinCC.

Migration of data types

The internal data types are mapped as follows during migration:

Internal data types WinCC flexible	Internal data types WinCC
Bool	Bool
Char	SInt
Byte	USInt
Int	Int
UInt	UInt
Long	DInt
ULong	UDInt
Float	Real
Double	LReal
String	WString
DateTime	DateTime

Migrating external data types

See the following pages for how to map the available communication drivers.

4.7.5.2 Migrating data types of Allen-Bradley DF1 (WinCC flexible)

Migrating data types Allen-Bradley DF1

The data types of the Allen-Bradley DF1 communication driver are mapped as follows in the migration to WinCC:

Data type in WinCC flexible	Data type in WinCC
ASCII	ASCII
BCD4	UInt
BCD8	UDInt
Bit	Bool
Int	Int
Long	DInt
Real	Real
UInt	UInt
ULong	UDInt

4.7.5.5 Migrating data types of Modicon Modbus (WinCC flexible)

Migrating data types Modicon Modbus

The Modicon Modbus communication driver is not supported by WinCC, it is replaced by the Modicon Modbus RTU driver. The data types of the Modicon Modbus communication driver are mapped as follows in the migration to WinCC:

Data type in WinCC flexible	Data type in WinCC
+/-Double	+/- Double
+/-Int	+/- Int
16 Bit Group	16 Bit Group
ASCII	ASCII
Bit	Bit
Double	Double
Float	Float
Int	Int

Migrating data types Omron Hostlink/Multilink

The Omron Hostlink/Multilink communication driver is not supported by WinCC, it is replaced by the Omron Host Link driver. The data types of the Omron Hostlink/Multilink communication driver are mapped as follows in the migration to WinCC:

Data type in WinCC flexible	Data type in WinCC
+/-DEC	Int
+/-LDEC	DInt
ASCII	String
BIN	Bool
BYTE	Byte
DEC	UInt
IEEE	Real
LDEC	UDInt

Migrating data types SIMATIC S7 300/400

The data types of the SIMATIC S7 300/400 communication driver are mapped as follows in the migration to WinCC:

Data type in WinCC flexible	Data type in WinCC
Bool	Bool
Byte	Byte
Char	see below
Counter	see below
Date	Date
Date and Time	Date_And_Time
DInt	DInt
DWord	DWord
Int	Int
Real	Real
String	String
StringChar	see below
Time	Time
Time of Day	Time_Of_Day
Timer	see below
Word	Word

Special considerations for some data types

There are special considerations to be made when migrating external tags that contain data types of a SIMATIC S7-300/400 PLC.

Mapping of the S7 data type "Char"

The S7 data type "Char" is a data type for mapping characters according to the specification. However, since this data type is often used for reading and writing numerical values, it is mapped in WinCC to the S7 data type "Byte". If this should be the case during migration, an alarm will appear in the output window.

If the S7 data type "Char" is used for numerical values and negative numbers were configured at the point of use, the result is an error in mapping to the S7 data type "Byte". The S7 data type "Byte" cannot map any negative numbers. You have to adapt the configuration accordingly to correct the error. Use a signed data type, such as the data type "Int", for processing positive and negative numerical values.

If the S7 data type "Char" is used for mapping characters, you must change the configuration after migration. To represent characters, use the data type "String".

When an integrated project is migrated, the data type "Char" in WinCC is also migrated to the data type "Byte". With a connected PLC tag, the data type "Char" remains "Char". As a result of changing the data type of the HMI tag, symbolic addressing of the tags in question is not migrated. After migration. the tags are interconnected by absolute addresses and continue to work. If you want to restore symbolic addressing, you have to change the configuration accordingly after the migration.

Mapping an array of the S7 data type "Char"

An array of the S7 data type "Char" is mapped to an array of the data type "Byte" during migration.

If an array of the S7 data type "Char" is used for numerical values and negative numbers were configured at the point of use, the result is an error in mapping to an array of the S7 data type "Byte". The S7 data type "Byte" cannot map any negative numbers. You have to adapt the configuration accordingly to correct the error. Use a signed data type, such as the data type "Int", for processing positive and negative numerical values.

Mapping of the S7 data type "Counter"

An external tag with the S7 data type "Counter" with counter address is mapped to the S7 data type "Counter". The address will be retained.

If an external tag with the S7 data type "Counter" addresses a data block or a bit memory address, it is is mapped to the S7 data type "Word". The address will be retained. The migration sets the coding to "SimaticBCDCounter".

The S7 data type "Counter" has a value range of 0-999. When supplied by the S7 data type "Word" the value range may be exceeded on the PLC side. Ensure that you are observing the value range.

Example:

WinCC flexible

Tag	S7 data type	Address	Comment
Counter_Actual_Value	Counter	C10	BCD coded counter value
Counter_Setpoint_Value	Counter	DB10.DBW200	BCD coded counter value
Counter_Setpoint_Value#2	Counter	MW20	BCD coded counter value

WinCC

Tag	S7 data type	Address	Coding	Comment
Counter_Actual_Value	Counter	%C10	<Standard>	BCD coded counter value
Counter_Setpoint_Value	Word	%DB10.%DBW200	SimaticBCDCounter	BCD coded counter value
Counter_Setpoint_Value#2	Word	%MW20	SimaticBCDCounter	BCD coded counter value

Mapping of the data type "StringChar"

In WinCC there is no corresponding data type to which the "StringChar" data type can be mapped. Mapping in WinCC depends on the property "Length" of the S7 data type.

A tag of the "StringChar" data type with the "Length" property > 1 is migrated to an array of the S7 data type "Char". The length of the array corresponds to the length of the originally configured data type "StringChar".

If the property "Length" = 1, the data type in WinCC is migrated to an array of the S7 data type "Char" with length = 1. The expression for an array with an element is "Array[0 ..0] of Char".

Mapping of the S7 data type "Timer"

An external tag with the S7 data type "Timer" with timer address is mapped to the S7 data type "Timer". The address will be retained.

If an external tag with the S7 data type "Timer" addresses a data block or a bit memory address, it is is mapped to the S7 data type "S5 Time". The address will be retained.

Example:

WinCC flexible

Tag	S7 data type	Address	Comment
Timer_Actual_Value	Timer	T10	BCD coded timer value
Timer_Setpoint_Value	Timer	DB10.DBW200	BCD coded timer value
Timer_Setpoint_Value#2	Timer	MW20	BCD coded timer value

WinCC

Tag	S7 data type	Address	Comment
Timer_Actual_Value	Timer	%T10	BCD coded timer value
Timer_Setpoint_Value	S5Time	%DB10.%DBW200	BCD coded timer value
Timer_Setpoint_Value#2	S5Time	%MW20	BCD coded timer value

4.8 Post-editing integrated projects

4.8.1 Migrating an integrated project

Introduction

When an integrated project is migrated, the complete project will be migrated with components from Wind and STEP 7. Configured connections between control and visualization remain intact.

Migrating an integrated project

When migrating an integrated project, the same requirements apply for the STEP 7 component as those for migration of a non-integrated STEP 7 project. The objects and properties contained in the Wind component must also be supported in Wind (IA Portal). For detailed information, refer to the documentation for Wind.

To fully migrate an integrated project, the following components must be installed on the PH/PC performing the migration:

- STEP 7 V5.4 SP5 or STEP 7 V5.5
- WinCC V7 SP1 or SP2 or Wind Flexible 2008 SP2

To be able to fully post-edit an integrated project, the following components must be installed on the PC for post-editing:

- STEP 7 Professional V11 (IA Portal)
- Wind Basic, Wind Comfort/Advanced oder Wind Professional, depending on the components used

If the initial project is not located on the same PH/PC on which the IA Portal is installed, first use the migration tool to prepare migration. This enables you to convert the initial project to a format that can be read for the IA Portal.

Migration of the STEP 7 part of an integrated project

An integrated project is always fully migrated. Individual components cannot be migrated on their own. You can only migrate the included STEP 7 project alone, if you have previously deleted all HMI stations in the SIMATIC stations in the SIMATIC manager and then recompiled the project in NetPro.

Alternatively, you can open the project in an installation of STEP 7 V5.4 S or V5.5 without an installation of Wind. Then, save the project again and select the "Reorganize" function during saving. The Wind parts are then automatically removed during the saving of the copy.

You can then migrate the STEP 7 project without the Wind project.

Migration of an integrated project without the hardware configuration

You can migrate an integrated project just like any other project without the hardware configuration. In this case, only the software of the initial project is migrated. The STEP 7 devices, network configurations, connections and interrupts used in the initial project are not migrated. However, HMI devices are always retained even if you migrate without hardware configuration.

HMI modules that are plugged into a PC station are converted to a separate Station during the migration. Thus, the migrated project contains a non-specified SIMATIC PC Station and a SIMATIC PC Station with the HMI devices. References to HMI devices are not imported during migration.

The following chapters describe, by way of example, how you post-edit an integrated project after the migration, in order to restore the full functionality of source project.

Storage location of an integrated Wind project

If you migrate an integrated project, the HMI portion of it must be on the same PH/PC as the STEP 7 portion of the project. If the HMI portion is on a different PH, then only the STEP 7 portion will be migrated.

Unsupported objects

The following components are not supported for migration:

- STEP 7 multiproject
  A STEP 7 multiproject cannot be migrated. Migration will be canceled.
- Central Archive Server - CAS
  If a CAS is part of an integrated project, then the migration will be carried out but the CAS data will not be migrated.

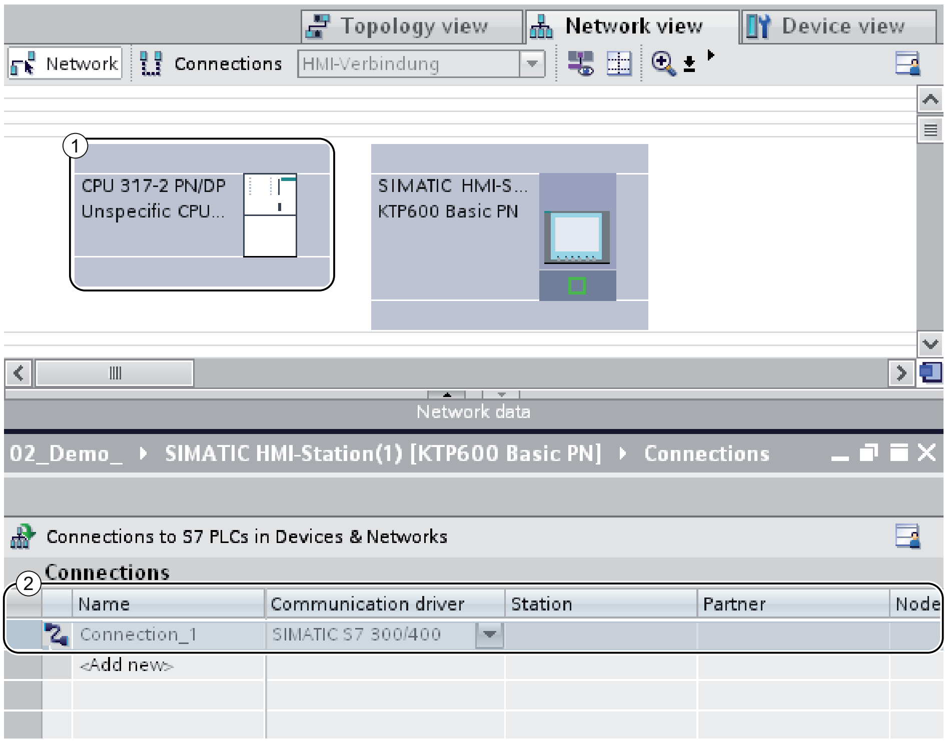
See also

Post-editing integrated projects (Page 152)

4.8.2 Post-editing integrated projects

If you have migrated an integrated project without hardware configuration, unspecified CPUs are used instead of the CPUs of the original project. Since no connection can exist between an unspecified CPU and an HMI device, connections from the source project are also imported only unspecified.

The following figure shows the state after a Migration without hardware configuration in an example project:



Name	Communication driver	Station	Partner	Node
Connection_1	SIMATIC S7 300/400			
<Add new>				

① The original CPU 317-2 PN/DP was replaced with an unspecified CPU during migration.

② The link between the CPU and HMI device is also unspecified and must be renewed.

Procedure

To continue to use an integrated project after the migration, follow these steps:

1. Convert the unspecified devices into suitable devices again.
2. Restore the integrated HMI connection between the HMI device and the PLC.
3. Connect all HMI tags to the newly created integrated connection.
4. Restore the connection between HMI tags and PLC tags.
5. Delete the non-integrated HMI connection.

In the following chapters a sample project is used to describe the individual steps in more detail.

See also

Converting unspecified CPUs into specified CPUs (Page 153)

Creating an integrated HMI connection (Page 155)

Re-linking HMI tags (Page 157)

Deleting an unspecified connection (Page 158)

4.8.3 Converting unspecified CPUs into specified CPUs

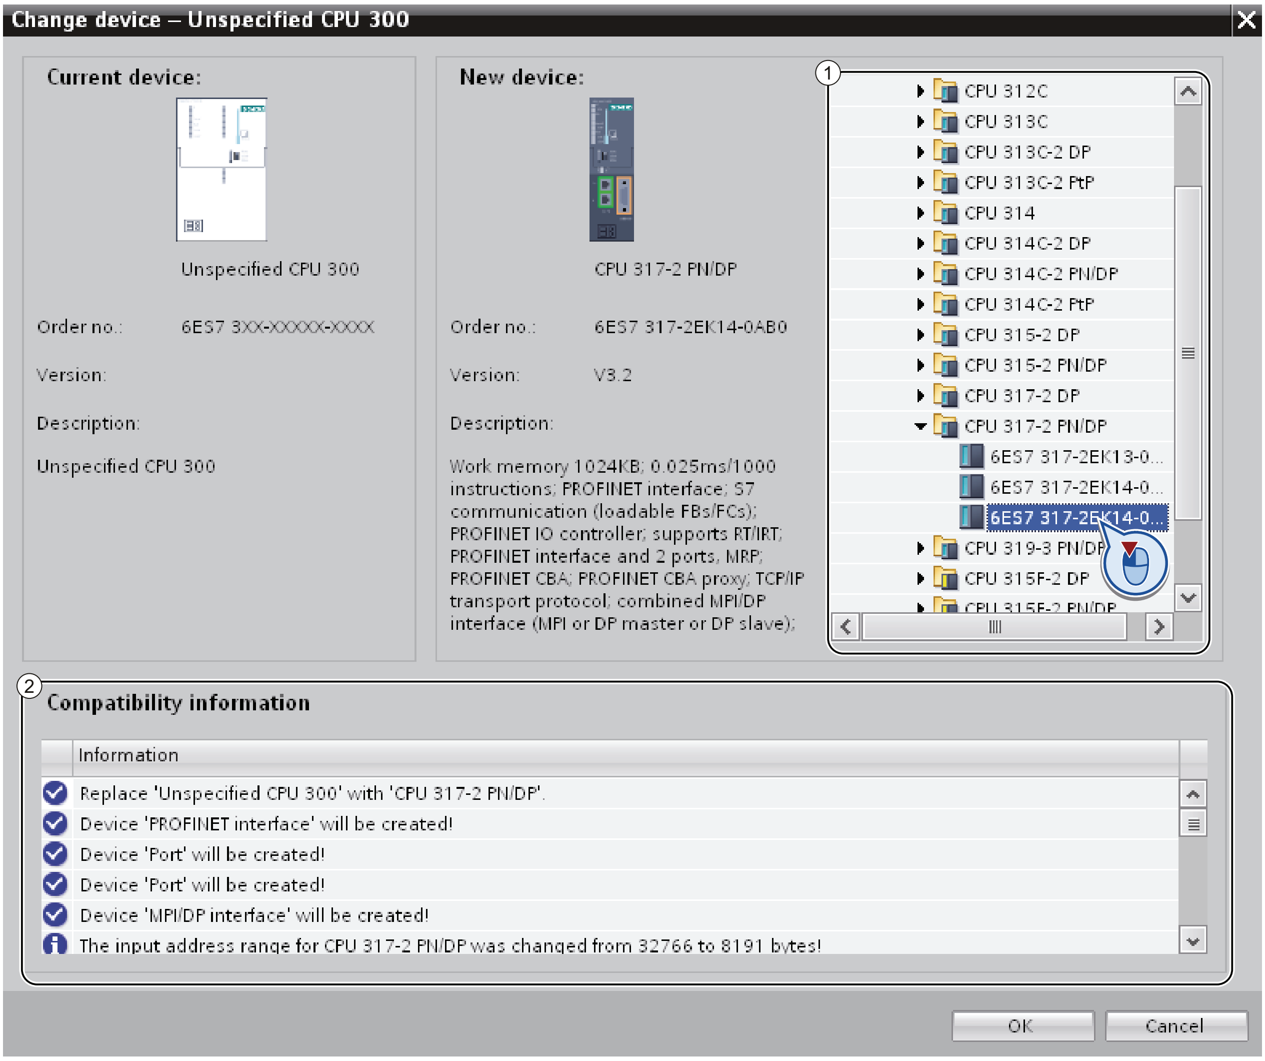
The first step after the migration without hardware configuration is the conversion of the unspecified CPUs into specified CPUs. Unspecified CPUs are placeholders for certain CPUs from the hardware catalog that are not currently known. You can define general parameters and home the CPUs already in the user program. However, the project is not fully functional until the unspecified CPU has been specified.

Specifying a CPU using module replacement

To use module replacement to specify an unspecified CPU, follow these steps:

1. Select the unspecified CPU in the network or device view.
2. Select the "Replace device" command in the shortcut menu.

   The "Replace device" dialog opens.



Change device – Unspecified CPU 300

Current device:

Unspecified CPU 300

Order no.: 6ES7 3XX-XXXXX-XXXX

Version:

Description:

Unspecified CPU 300

New device:

CPU 317-2 PN/DP

Order no.: 6ES7 317-2EK14-0AB0

Version: V3.2

Description:

Work memory 1024KB; 0.025ms/1000 instructions; PROFINET interface; S7 communication (loadable FBs/FCs); PROFINET IO controller; supports RT/IRT; PROFINET interface and 2 ports, MRP; PROFINET CBA; PROFINET CBA proxy; TCP/IP transport protocol; combined MPI/DP interface (MPI or DP master or DP slave);

Compatibility information

Information
Replace 'Unspecified CPU 300' with 'CPU 317-2 PN/DP'.
Device 'PROFINET interface' will be created!
Device 'Port' will be created!
Device 'Port' will be created!
Device 'MPI/DP interface' will be created!
The input address range for CPU 317-2 PN/DP was changed from 32766 to 8191 bytes!

3. Under "New device" in the tree structure, select the module with which you want to replace the unspecified CPU. (Area 1)

   "Compatibility information" provides you with information on the extent to which the selected CPU is compatible with the configuration in source project. (Area 2)
4. Click "OK".
5. Perform the above-described steps for all unspecified CPUs.

See also

Creating an integrated HMI connection (Page 155)

4.8.4 Creating an integrated HMI connection

After you have specified the unspecified CPU, establish the connection to the HMI-device.

Procedure

To create a connection graphically, follow these steps:

1. On the toolbar, click the "Connections" icon. This activates connection mode.

2. Select the connection type "HMI connection" in the adjacent drop-down list.

   The network view highlights in color all CPUs and HMI devices that can be used for an HMI connection.

3. You can now have the connection path automatically determined, or explicitly select a connection path via specific interfaces:

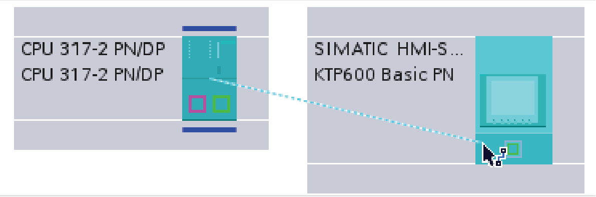
   – Allow connection path to be automatically determined

     Select the source CPU for a connection. Drag the mouse to the target components. Confirm the connection endpoint with another mouse click.

     Alternatively: While holding down the shift button, select the target components and with the right mouse button select the "Add new connection" command.

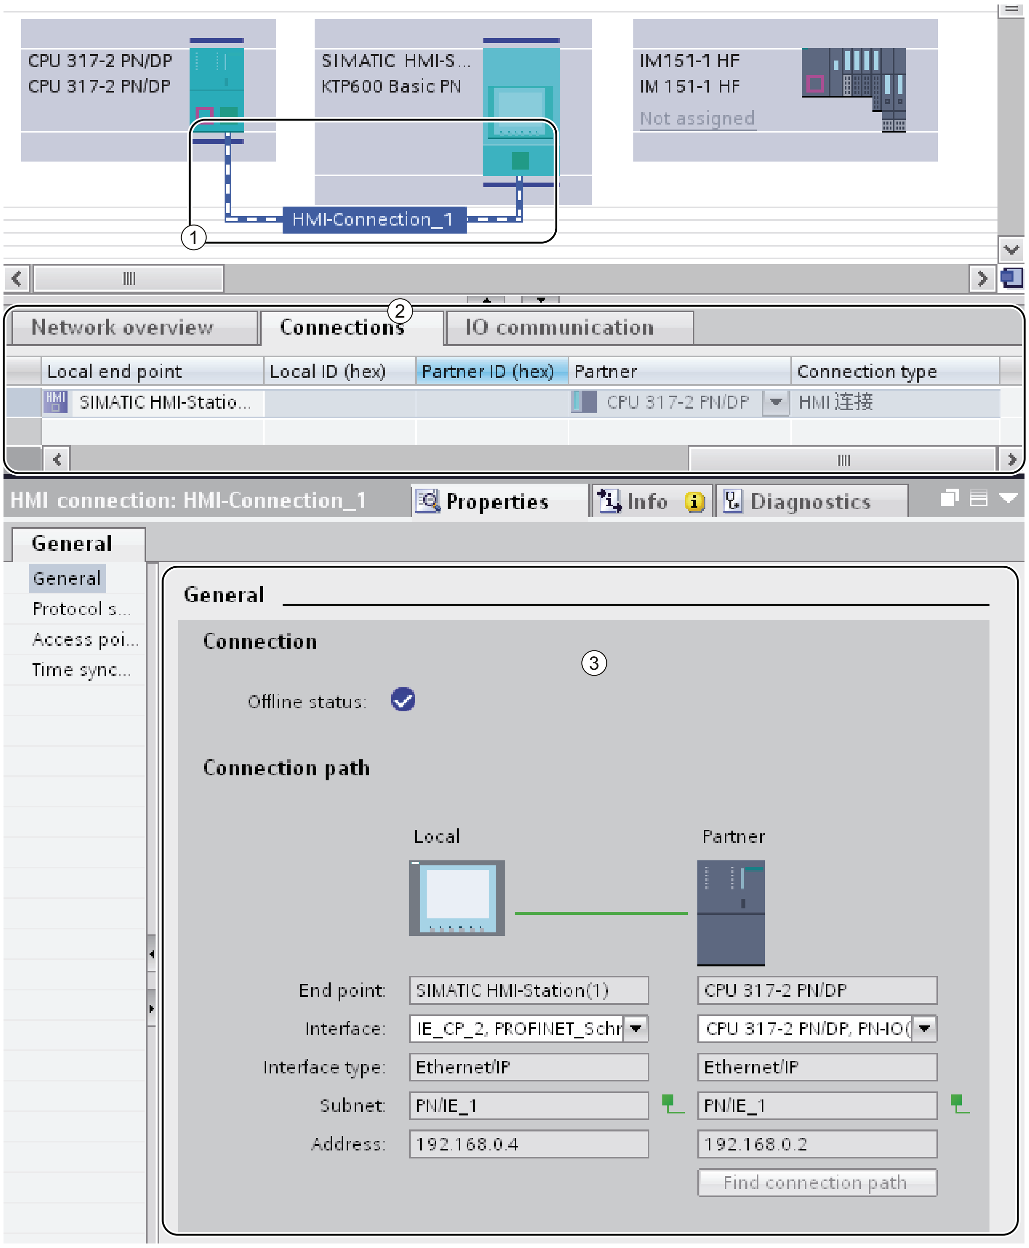
   – Selecting an explicit connection path from interface to interface

     Click on the subnet interface in the device for which you want to create a connection. Hold down the mouse button, drag the cursor to the relevant interface in the target device and then release the mouse button.



Result

The following figure shows the state after the integrated connection has been created:



Local end point	Local ID (hex)	Partner ID (hex)	Partner	Connection type
SIMATIC HMI-Statio...			CPU 317-2 PN/DP	HMI 连接

General

Connection

Offline status: ✓

Re-linking HMI tags (Page 157)

4.8.5 Re-linking HMI tags

When you have created a new HMI connection between the CPU and HMI device, you have to assign the existing HMI tags to the new connection. Perform the following steps for each line in the relevant tag table.

Procedure

To re-link HMI tags, follow these steps:

1. In the project tree, navigate to the HMI tags and double-click the relevant tag table to show this in the work area.

   The tag table opens.

5.1 Getting Started Documentation

Getting started with the TIA Portal

The Getting Started documentation is available to help you begin using the TIA portal.

The Getting Started documentation contains instructions which show you, step-by-step how to create a project in the TIA portal and give you the chance to get a quick overview of all the possibilities the TIA portal offers you.

Contents

The Getting Started documents describe the creation of a single, continuous project that is extended with each chapter. You start with simple basic functions, and use more complex ones as you continue with the creation of the project.

In addition to the step-by-step instructions, the Getting Started documents also give you background information that explains the functions used and illustrate how they relate to each other.

Target audience

The Getting Started documents are intended for beginners, but are also useful for users migrating from a previous version of SIMATIC STEP 7 and WinCC.

Download

The documentation is available, free of charge at the Service&Support (https://support.automation.siemens.com) portal in PDF form.

You can download the documents here:

- STEP 7 Basic (http://support.automation.siemens.com/WW/view/en/40263542/0/en)
- STEP 7 Professional (http://support.automation.siemens.com/WW/view/en/28919804/133300)

Introduction to the TIA Portal 6

6.1 User interface and operation

6.1.1 Starting, setting and exiting the TIA Portal

6.1.1.1 Starting and exiting the TIA Portal

Starting the TIA Portal

Follow the steps below to start the TIA Portal:

1. In Windows, select "Start > Programs > Siemens Automation > TIA Portal V11".

   The TIA Portal opens with the last settings used.

Exiting the TIA Portal

Follow the steps below to exit the TIA Portal:

1. In the "Project" menu, select the "Exit" command.

   If the project contains any changes that have not been saved, you will be asked if you wish to save them.

   – Select "Yes" to save the changes in the current project and close the TIA Portal.

   – Select "No" to close the TIA Portal without saving the most recent changes in the project.

   – Select "Cancel" to cancel the closing procedure. The TIA Portal will remain open if you select this option.

6.1.1.2 Overview of the program settings

Overview

The following table shows the application settings that you can make:

Group	Setting	Description
General settings	User name	The user name of the user. The user name is stored in the project properties when a new project is created.
	User interface language	Language for the program interface
	Mnemonic	Specifies the mnemonics for programming: "German" uses the German mnemonics, for example, "E1.0". "International" uses international mnemonics, for example, "I1.0". For information on the differences in the mnemonics of the individual commands, refer to the description of the relevant programming language.
	Show list of recently used projects	Number of entries in the list of recently used projects in the "Project" menu
	Show all message windows	All message windows whose appearance was manually suppressed are displayed again.
	Open cascade automatically in tooltips	After a brief time, the tooltips automatically expand to display a cascade containing additional help. If this option is cleared, the tooltips must be manually expanded.
Layout	Load most recent project during startup	The last opened project is opened automatically after the TIA Portal starts.
	Reset layout	Resets the complete layout of the application to factory settings.
Start view	Most recent view	Starts the program in the last view that was used. This can be be either the portal view or the project view.
	Portal view	The TIA Portal will always be started in the portal view, irrespective of the last view you worked in.
	Project view	The TIA Portal will always be started in the project view, irrespective of the last view you worked in.
View for objects in overview	Details	When several views are available, the detail view opens by default, for example, in the overview window.
	List	When several views are available, the list view opens by default, for example, in the overview window.
	Thumbnails	When several views are available, the symbol view opens by default, for example, in the overview window.
Storage settings	Recently used storage location	When a project is saved the first time, the most recently used file path is set by default.
	Default storage location	Enables the specification of file paths for: • Projects • Libraries

Group	Setting	Description
Data exchange	Storage location for data import	Imported files are searched for at this storage path by default.
	Storage location for data export	This is the default storage path for the data export.
	Storage location for support packages	When support packages are downloaded, they are stored in the specified storage path and can be installed from there.
	Storage location for log files	Log files are stored at the location specified here.

6.1.1.3 Overview of the script and text editor settings

Overview

The following table shows the available settings for script and text editors:

Group	Setting	Description
Font	Font type and size	Sets the font type and size for the text in text editors.
Font colors	Color settings	You can choose the colors for individual text elements from the respective drop-down lists in the text editors. Optional settings are available for the following text elements: • Text • Keywords • Comments • Translatable comments • Instructions • Scripts • Standard functions • System functions • Constant strings • Constant tags • Tags • Object models • Formal parameters
	Reset to default	Resets all font colors in editors to their factory settings.
Tabs	Tab width	Sets the width of tabs.
	Use tabs	Enables the use of tabs.
	Use spaces	Specifies use of space characters instead of tabs.
Indent	Indention at start of paragraph	Specifies whether the start of a new paragraph is to be indented. The following selection options are available: • None No indentation is used at the beginning of a paragraph in editors. • Block The first line of a paragraph in the editors is automatically indented. • Smart The program code is detected and the paragraphs are automatically indented to improve readability of the syntax.
View	Show line numbers	Displays the line numbers on the left side of the text.
	Show white spaces	Shows control characters within a text.

Group	Setting	Description
STL (statement list)	Font type and size	Sets the font type and size for STL program code.
SCL (Structured Control Language)	Font type and size	Sets the font type and size for SCL.
	Indentation	Creates SCL programs automatically with syntactically correct indentation.
	Show line numbers	Shows the row numbers in SCL programs.

Changing the settings (Page 166)

6.1.1.4 Overview of the print settings

Overview

The following table shows the available settings for printing:

Group	Setting	Description
General	Always print table data as pairs of values	Tables are printed as a list and not in tabular form. The corresponding values are listed for each column. Enable this option, for example, if you want to print a table that is too large for the print area.
	Always print data in tables	All parameters of technology objects are printed in tabular format.
	Print mask graphics if possible	If the utilized editor supports this function, the contents of the editor are printed not only as a table but rather as a complete graphic as it appears on the screen.
Hardware configuration	Active graphic view	The graphics of network and device view are included in the printout.
	Active table	A table associated with an editor is included when printing with the editor.
PLC Programming	Zoom factor	Specifies the size in which blocks are to be printed out.
	With interface	The interfaces of blocks are included in the printout.
	With comments	Comments on blocks are included in the printout.
	With line numbers	The line numbers of the program code are printed for text-based programming languages.
HMI screens	Show tab order	In the printout you can specify the order in which the runtime objects can be selected with the TAB key.

Changing the settings (Page 166)

6.1.1.5 Changing the settings

Procedure

To change the settings, proceed as follows:

1. Select the "Settings" command in the "Options" menu.

   The "Settings" window is displayed in the work area.
2. Select the "General" group in the area navigation to change the settings described in the previous sections. Or click on one of the other entries in area navigation to make settings for your installed products.
3. Change the settings.

Result

The change will be adopted immediately, there is no need to save it explicitly.

6.1.2 Layout of the user interface

6.1.2.1 Views

Views

Two different views are available for your automation project:

- The portal view is a task-oriented view of the project tasks.
- The project view is a view of the components of the project, as well as the relevant work areas and editors.

You can change over between the two views using a link.

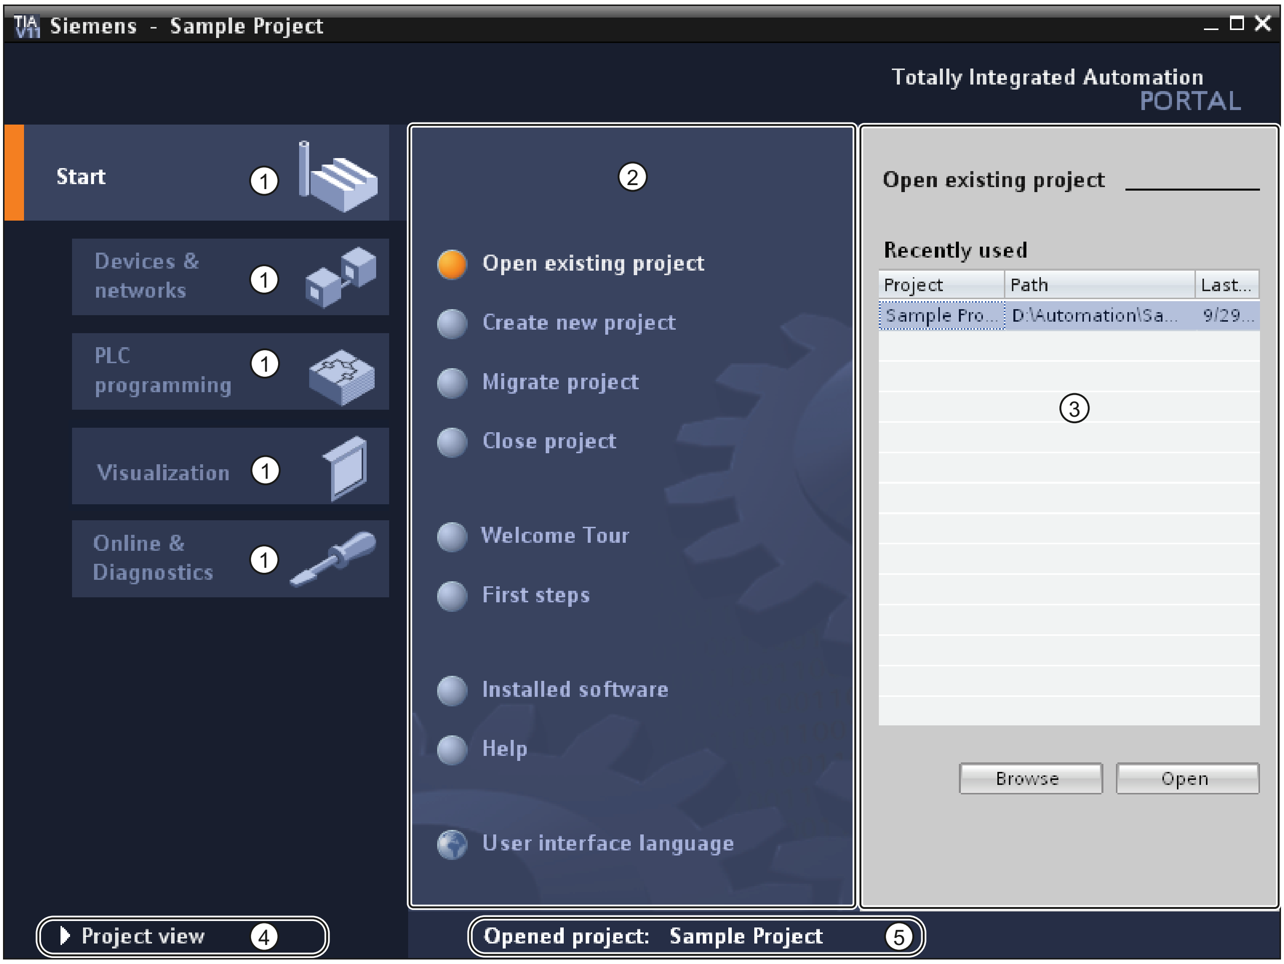
6.1.2.2 Portal view

Purpose of the portal view

The portal view provides you with a task-oriented view of the tools. Here, you can quickly decide what you want to do and call up the tool for the task in hand. If necessary, the view changes automatically to the project view (Page 169) for the selected task.

Layout of the portal view

The following figure shows an example of the components in the portal view:



Project	Path	Last...
Sample Pro...	D:\Automation\Sa...	9/29...

① Portals for different tasks

② Actions for the selected portal

③ Selection panel for the selected action

④ Change to the project view

⑤ Display of the project that is currently open

Portals

The portals provide the basic functions for the individual task areas. The portals that are provided in the portal view depends on the products that have been installed.

Actions for the selected portal

Here, you will find the actions available to you in the portal you have selected. You can call up the help function in every portal on a context-sensitive basis.

Selection panel for the selected action

The selection panel is available in all portals. The content of the panel adapts to your current selection.

Change to the project view

You can use the "Project view" link to change to the project view.

Display of the project that is currently open

Here, you can obtain information about which project is currently open.

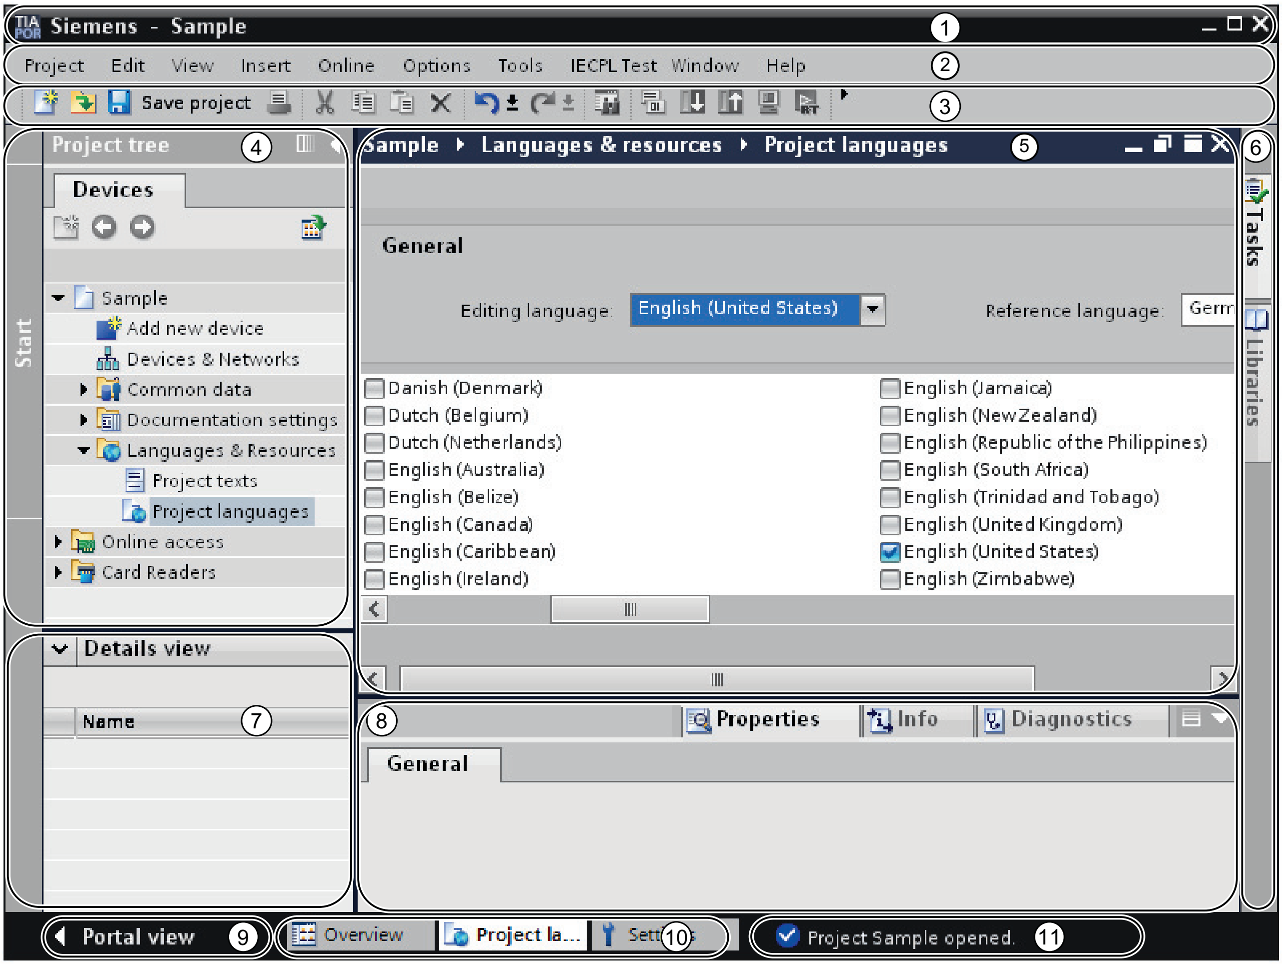
6.1.2.3 Project view

Purpose of the project view

The project view is a structured view of all components of the project.

Layout of the project view

The following figure shows an example of the components of the project view:



Editing language: English (United States)

Reference language: Germ

☐ Danish (Denmark)
☐ Dutch (Belgium)
☐ Dutch (Netherlands)
☐ English (Australia)
☐ English (Belize)
☐ English (Canada)
☐ English (Caribbean)
☐ English (Ireland)
☐ English (Jamaica)
☐ English (New Zealand)
☐ English (Republic of the Philippines)
☐ English (South Africa)
☐ English (Trinidad and Tobago)
☐ English (United Kingdom)
☑ English (United States)
☐ English (Zimbabwe)

①	Title bar
②	Menu bar
③	Toolbar
④	Project tree (Page 171)
⑤	Work area (Page 175)
⑥	Task cards (Page 186)
⑦	Details view (Page 189)
⑧	Inspector window (Page 184)
⑨	Changing to the Portal view (Page 167)
⑩	Editor bar
⑪	Status bar with progress display

Title bar

The name of the project is displayed in the title bar.

Menu bar

The menu bar contains all the commands that you require for your work.

Toolbar

The toolbar provides you with buttons for commands you will use frequently. This gives you faster access to these commands.

Changing to the portal view

You can use the "Portal view" link to change to the portal view.

Editor bar

The Editor bar displays the open editors. If you have opened a lot of editors, they are shown grouped together. You can use the Editor bar to change quickly between the open elements.

Status bar with progress display

In the status bar, you will find the progress display for processes that are currently running in the background. This also includes a progress bar that shows the progress graphically. Hover the mouse pointer over the progress bar to display a tooltip providing additional information on the active background process. You can cancel the background processes by clicking the button next to the progress bar.

If no background processes are currently running, the status bar displays the last generated alarm.

6.1.2.4 Project navigation

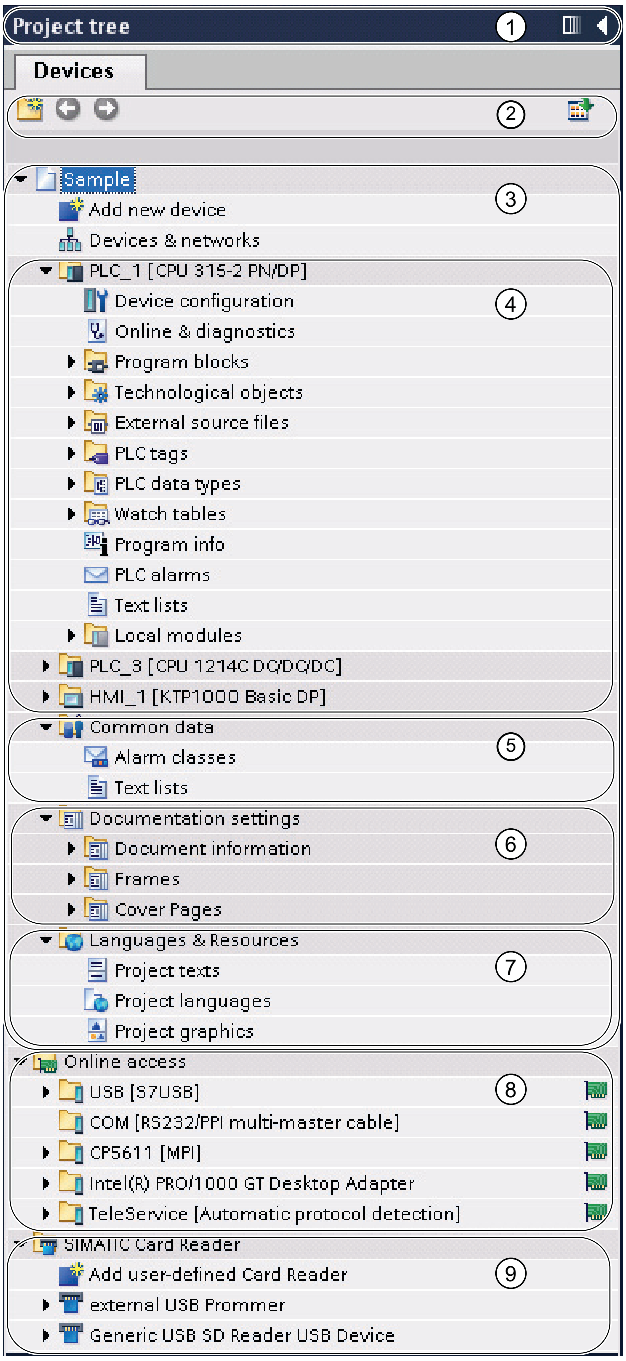
Function of the project tree

Using the project tree features gives you access to all components and project data. You can perform the following tasks in the project tree:

- Add new components
- Edit existing components
- Scan and modify the properties of existing components

Layout of project tree

The following figure shows an example of the project tree components:



①	Title bar
②	Toolbar
③	Project
④	Devices
⑤	Common data
⑥	Document information
⑦	Languages & resources
⑧	Online access
⑨	SIMATIC Card Reader

Title bar

The title bar of the project tree has a button for automatically and manually collapsing the project tree. Once it is collapsed manually, the button is "Reduced" to the left-hand margin. It changes from an arrow pointing left to one that is pointing right, and can now be used to reopen the project tree. You can use the "Reduce automatically" button collapse to project tree automatically when you do not need it.

See also: Maximizing and minimizing the work area (Page 177)

Toolbar

You can do the following tasks in the toolbar of the project tree:

- Create a new user folder; for example, in order to group blocks in the "Program blocks" folder.
- Navigate forward to the source of a link and back to the link itself.

  There are two buttons for links in the project tree. You can use these to navigate from the link to the source and back.
- Show an overview of the selected object in the work area.

  When the overview is displayed, the lower-level objects and actions of the elements in the project tree are hidden.

Project

You will find all the objects and actions related to the project in the "Project" folder, e.g.:

- Devices
- Languages & resources
- Online access

Device

There is a separate folder for each device in the project, which has an internal project name. Objects and actions belonging to the device are arranged inside this folder.

Common data

This folder contains data that you can use across more than one device, such as common message classes, scripts and text lists.

Document information

In this folder, you can specify the layout for project documentation to be printed at a later point.

Languages & resources

You can determine the project languages and texts in this folder.

Online access

This folder contains all the interfaces of the programming device / PC, even if they are not used for communication with a module.

SIMATIC Card Reader

This folder is used to manage all card readers connected to the programming device / PC.

6.1.2.5 Work area

Basics of the work area

Function of the work area

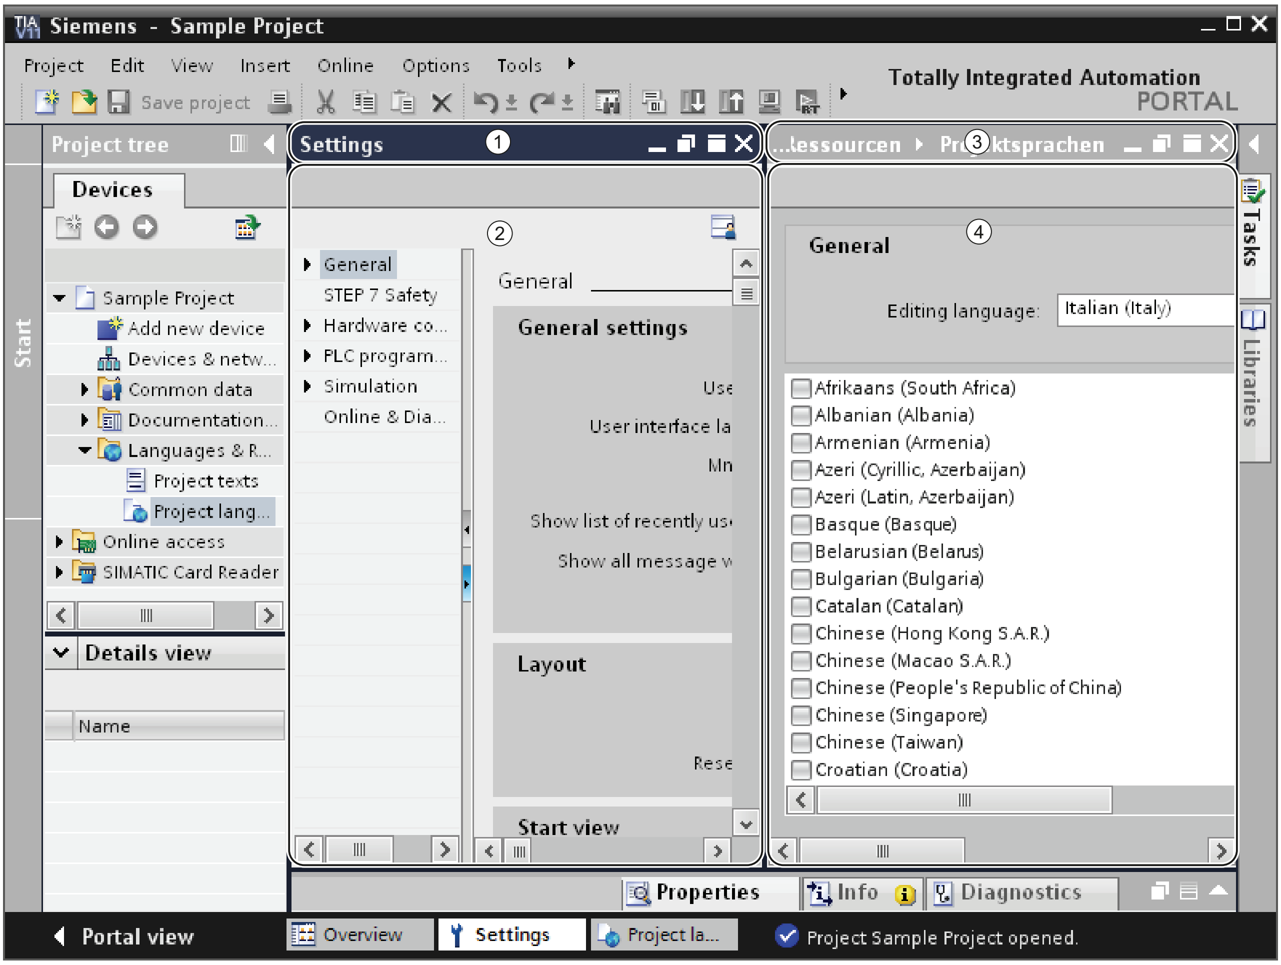
The objects that you can open for editing purposes are displayed in the work area. These objects include, for example:

- Editors and views
- Tables

You can open several objects. However, normally it is only possible to see one of these at a time in the work area. All other objects are displayed as tabs in the Editor bar. If, you would like to view two objects at the same time when performing certain tasks, you can tile the work area either horizontally or vertically or undock elements of the work area. If no objects are open, the work area will be empty.

Layout of the work area

The following figure shows an example of a vertically split work area:



Editing language: Italian (Italy)

Project Sample Project opened.

① Title bar of left-hand editor

② Work area of left-hand editor

③ Title bar of right-hand editor

④ Work area of right-hand editor

Minimizing and maximizing elements of the work area (Page 181)

Switching between the elements in the work area (Page 182)

Saving a layout of editors and tables (Page 183)

Maximizing and minimizing the work area

You have the option to adapt the work area to make it as large as possible. You can use the following function for this:

- Maximizing the work area

  You can close the task cards, project tree and inspector window with a single click. This increases the size of the work area. You can minimize the work area again at any time in order to return to the previous view.
- Collapsing task cards, project tree, and Inspector window automatically

  You can use the "Collapse automatically" option for the task cards, project tree, and Inspector window. This function causes these items to collapse automatically when you don't need them.

Maximizing and minimizing the work area

To maximize the work area, follow these steps:

1. Open an element such as an editor or a table.

   The element appears in the work area.
2. Click the "Maximize" button in the title bar of the element.

   The task cards, project tree and inspector window collapse, and the work area is shown with its maximum dimensions.

To minimize the work area again, follow these steps:

1. Click the "Embed" button in the title bar of the displayed element.

   This restores the view that existed before the work area was maximized. That is, if the task cards, project tree, or Inspector window were expanded before, they will be expanded again.

Collapsing task cards, project tree, and Inspector window automatically

To collapse the task cards automatically, follow these steps:

1. Click "Collapse automatically" in the title bar of the task cards.

   The task cards collapse when you click anywhere outside the task cards.
2. To use the task cards, click the collapsed task cards.
3. The task cards expand and are available for use. The "Collapse automatically" option remains enabled.

To collapse the project tree automatically, follow these steps:

1. Click "Collapse automatically" in the title bar of the project tree.

   The project tree collapses when you click anywhere outside the project tree.
2. To use the project tree, click the collapsed project tree.

   The project tree expands and is available for use. The "Collapse automatically" option remains enabled.

To collapse the Inspector window automatically, follow these steps:

1. Click "Collapse automatically" in the title bar of the Inspector window.

   The Inspector window collapses when you click anywhere outside the Inspector window.
2. To use the Inspector window, click the collapsed Inspector window.

   The Inspector window expands and is available for use. The "Collapse automatically" option remains enabled.

To disable the automatic collapse option, follow these steps:

1. Click "Expand permanently" again in the relevant window.

   The Collapse automatically" option is disabled, and the window remains expanded.

Switching between the elements in the work area (Page 182)

Saving a layout of editors and tables (Page 183)

Splitting the work area

You can split the work area vertically or horizontally.

Procedure

To split the work area vertically or horizontally, follow these steps:

1. In the "Window" menu, select the "Split editor space vertically" or "Split editor space horizontally" command.

   The element you have clicked and the next element in the Editor bar will be displayed either next to one another or one above the other.

Note

If no elements are open in the work area, the "Split editor space vertically" and "Split editor space horizontally" functions will not be available.

Switching between the elements in the work area (Page 182)

Saving a layout of editors and tables (Page 183)

Floating the work area elements

You can float work area elements in their own separate window:

- Editors
- Tables
- Setting windows
- Task cards
- Inspector window

You can embed floating elements again in the work area at any time.

Floating the work area elements

To float work area elements, follow these steps:

1. Click the "Float" button in the title bar of the element.

   The element will be released from the work area and displayed in its own window. You can now place the window wherever you wish. If you have minimized the window, you can restore it via the editor bar.

Embedding elements in the work area

To embed elements in the work area again, follow these steps:

1. Click the "Embed" button in the title bar of the element.

   The element will appear in the work area again.

See also

Basics of the work area (Page 175)

Minimizing and maximizing elements of the work area (Page 181)

Switching between the elements in the work area (Page 182)

Saving a layout of editors and tables (Page 183)

Using grouped elements of the work area

If you open more than five elements of the same type, e.g., editors or tables, they are grouped in the editor bar. You can use these groups as follows:

- Displaying individual elements of a group
- Displaying all elements of a group in separate windows
- Embedding all displayed elements of a group in the work area
- Minimizing all displayed elements
- Closing all elements of a group

Displaying individual elements of a group

To display individual elements of a group, follow these steps:

1. In the editor bar, click the group containing the element you want to display.

   All list of all available elements of the group is displayed.

2. Click the element that you want to display.

Displaying all elements of a group in separate windows

To display all elements of a group in separate windows, follow these steps:

1. In the editor bar, right-click the group whose elements you want to display.
2. Select "Restore group" in the shortcut menu.

   All elements of the group are displayed in separate, overlapping windows. Move the windows in order to see the individual element, or choose an element via the group in the editor bar.

Embedding all displayed elements of a group in the work area

To embed all elements of a group displayed in separate windows in the work area again, follow these steps:

1. In the editor bar, right-click the group whose elements you want to embed.
2. Select "Embed group" in the shortcut menu.

   All elements of the group are embedded in the work area again.

Minimizing all displayed elements

To minimize all elements of a group, follow these steps:

1. In the editor bar, right-click the group whose elements you want to minimize.
2. Select "Minimize group" in the shortcut menu.

   All elements of the group are minimized. However, the minimized elements remain open and can be quickly maximized again via the group in the editor bar.

Closing all elements of a group

To close all elements of a group, follow these steps:

1. In the editor bar, right-click the group whose elements you want to close.
2. Select "Close group" in the shortcut menu.

   All elements of the group are closed. The group is removed.

Minimizing and maximizing elements of the work area

You can minimize the elements that are open in the work area, such as editors or tables, as needed. However, an element remains open even if it has been minimized, and can quickly be maximized again using the editor bar.

Minimizing elements in the work area

To minimize elements in the work area, follow these steps:

1. Click the "Minimize" button in the title bar of the element.

   The element is minimized, but can still be accessed via the editor bar.

To minimize all elements at the same time, follow these steps:

1. In the "Window" menu, select the "Minimize all" command.

Maximizing elements in the work area

To maximize elements in the work area again, follow these steps:

1. Click the required element in the editor bar.

   The element is maximized and appears in the work area.

Saving a layout of editors and tables (Page 183)

Saving a layout of editors and tables

You have the option of adapting editors and tables to meet your requirements. For example, you can hide columns in tables that you don't need. You can then save your customized view.

Procedure

To save the layout of editors and tables in the work area, follow these steps:

1. Adapt the editor or table according to your requirements.
2. Click the "Remember Layout" button in the editor or table.

Result

The layout is saved. When you reopen the editor or table, this layout will be used.

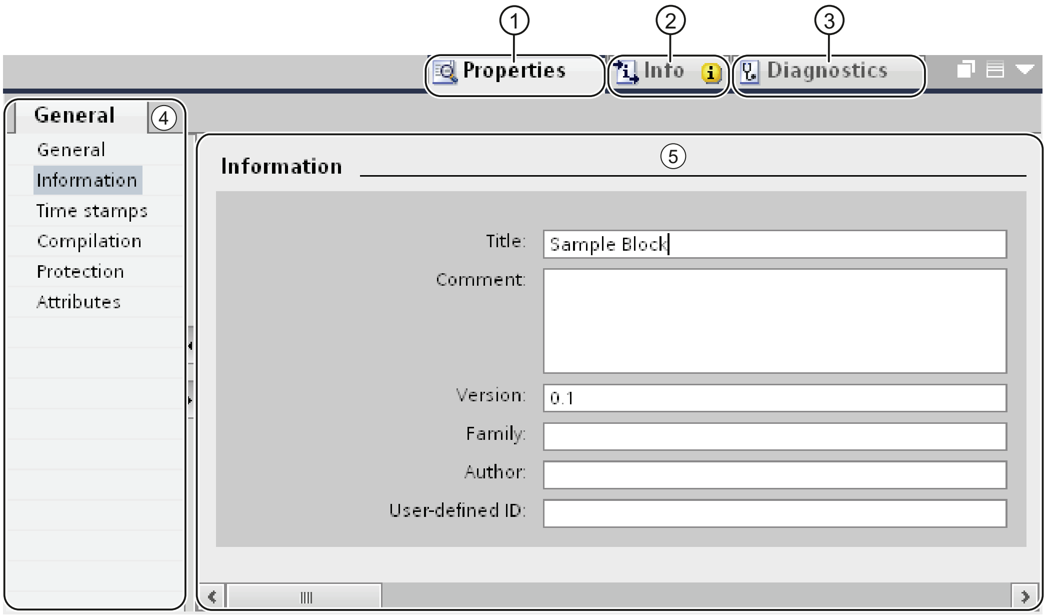
6.1.2.6 Inspector window

Function of the Inspector window

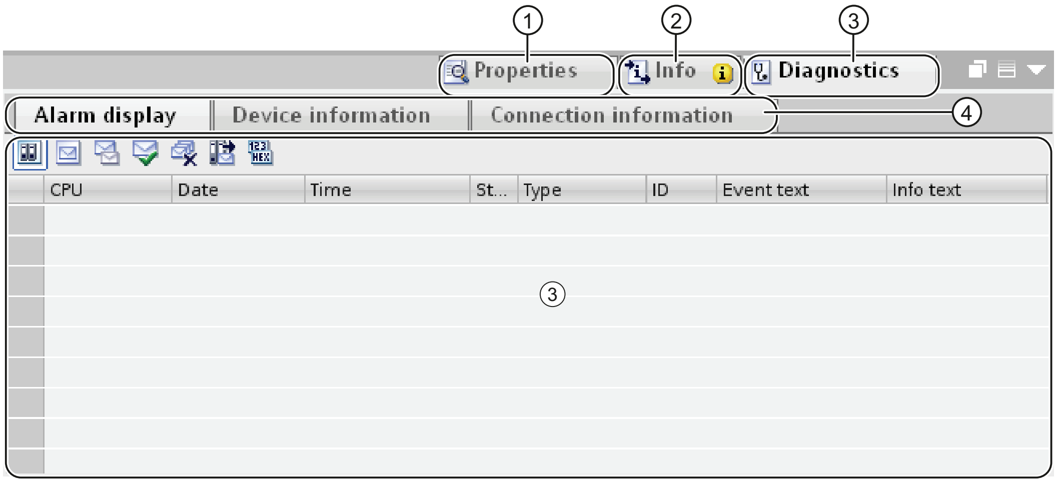
Additional information on an object selected or on actions executed are displayed in the inspector window.

Layout of the Inspector window

The following figures show the components of the Inspector window:



Title: Sample Block
Comment:
Version: 0.1
Family:
Author:
User-defined ID:



CPU	Date	Time	St...	Type	ID	Event text	Info text

① "Properties" tab

② "Info" tab

③ "Diagnostics" tab

④ Navigation within the tabs:

- Area navigation within the "Properties" tab
- Lower-level tabs in the "Info" and "Diagnostics" tabs

"Properties" tab

This tab displays the properties of the object selected. You can change editable properties here.

"Info" tab

This tab displays additional information on the object selected, as well as alarms on the actions executed (such as compiling).

"Diagnostics" tab

This tab provides information on system diagnostics events, configured alarm events, and connection diagnostics.

Navigation within the tabs

You can use area navigation and the lower-level tabs to display the information you require within the tabs.

6.1.2.7 Task cards

Basics on task cards

Function of task cards

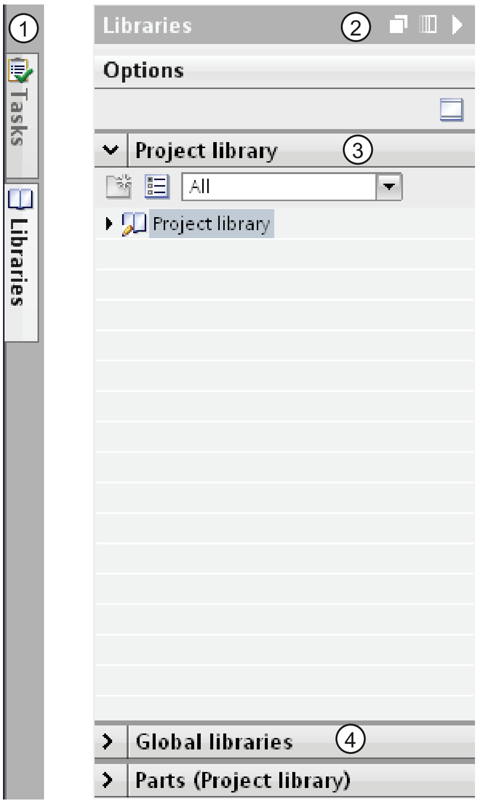
Depending on the edited or selected object, task cards that allow you perform additional actions are available. These actions include:

- Selecting objects from a library or from the hardware catalog
- Searching for and replacing objects in the project
- Dragging predefined objects to the work area

The task cards available can be found in a bar on the right-hand side of the screen. You can collapse and reopen them at any time. Which task cards are available depends on the products installed. More complex task cards are divided into panes that you can also collapse and reopen.

Layout of task cards

The following figure shows an example of the bar with the task cards:



① Task cards closed

② "Libraries" task card open

③ "Project library" pane open

④ "Global libraries" pane closed

Changing the pane mode

You can choose between two pane modes:

- Single pane mode:

  Only one pane is open at any given time. If you open another pane, the previously opened pane is closed automatically.
- Multi-pane mode:

  You can open several panes at the same time.

Procedure

To change the pane mode, follow these steps:

1. Click the "Change pane mode" button above the panes inside a task card.

See also

Basics on task cards (Page 186)

6.1.2.8 Details view

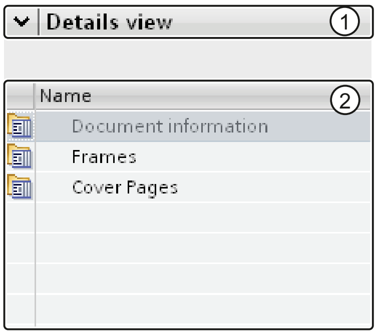
Purpose of the details view

The detail view shows certain content of the selected object is in the overview window or in the project tree. This might include text lists or tags.

The content of folders is not shown, however. To display the content of folders, use the project tree or the Inspector window.

Layout of the details view

The following figure shows an example of the details view:



Name
Document information
Frames
Cover Pages

① Title bar

② Content of the selected object

Title bar

The arrow for closing the details view is located in the title bar of the details view. After it has closed, the direction in which the arrow is pointing changes from left to right. It can now be used to reopen the details view.

Objects

The displayed content varies depending on the selected object. You can move the content of objects from the details view to the required location using drag-and-drop.

6.1.2.9 Overview window

Overview window

Functions of the Overview window

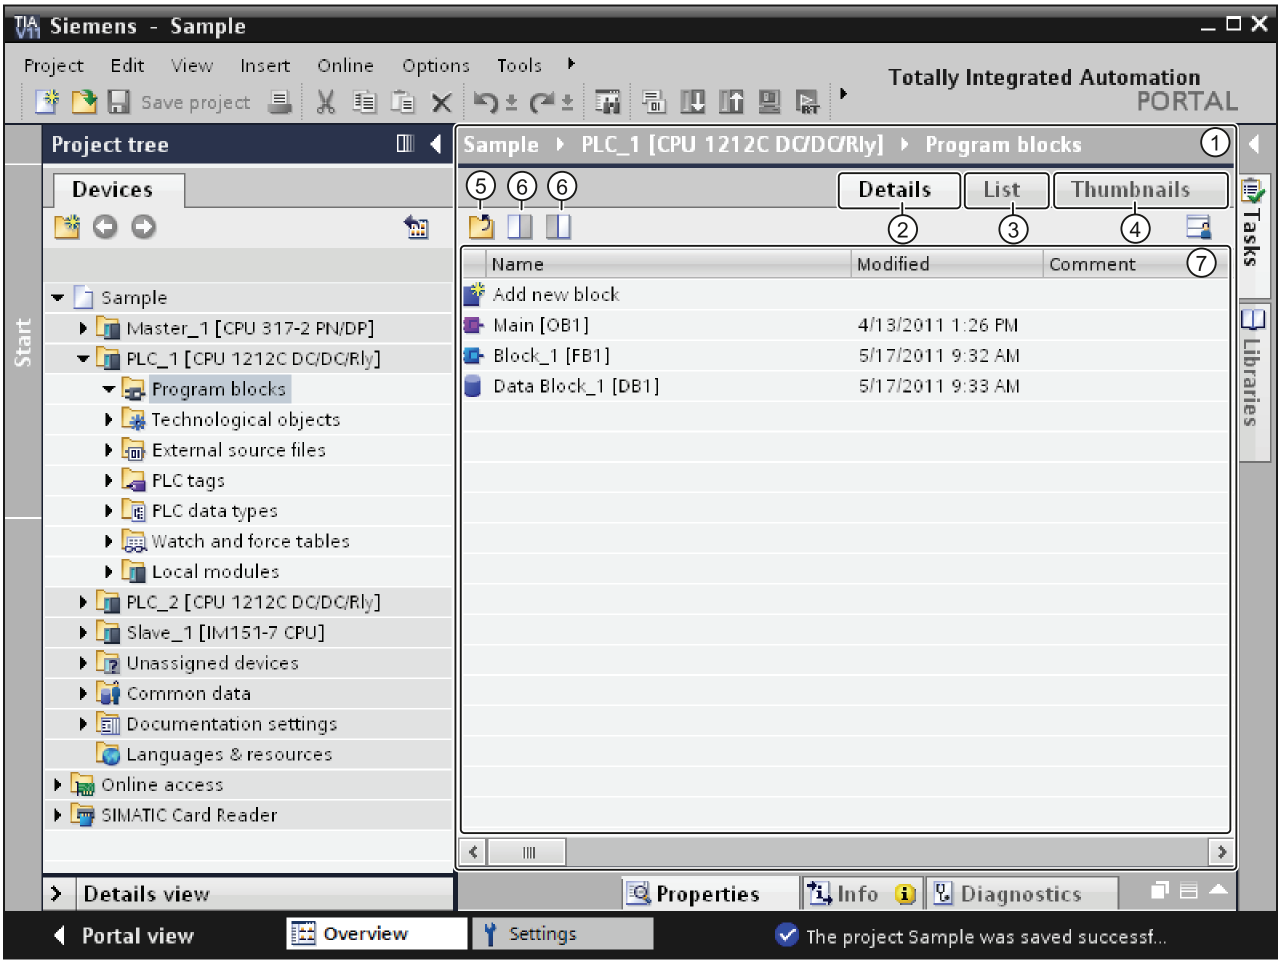
The Overview window supplements the project tree. The Overview window shows the contents of the folder currently selected in the project tree.

In addition, you can perform the following actions in the Overview window:

- Open objects
- Display and edit the properties of objects in the Inspector window
- Rename objects
- Call object-specific actions from the shortcut menu
- Compare objects side by side
- Perform various object operations, such as inserting objects from the library via drag-and-drop and moving, copying, pasting, and deleting objects

Layout of the Overview window

The following figure shows the components of the Overview window:



Name	Modified	Comment
Add new block		
Main [OB1]	4/13/2011 1:26 PM	
Block_1 [FB1]	5/17/2011 9:32 AM	
Data Block_1 [DB1]	5/17/2011 9:33 AM	

The project Sample was saved successf...

① Overview window
② Switch to the Details view
③ Switch to the List view
④ Switch to the Icon view
⑤ Move to higher level
⑥ Split the overview window in two. Either the right or left half of the overview window is synchronized. Clicking again cancels the split.
⑦ Contents of the object selected in the project tree.

Display forms of the Overview window

The content of the Overview window can be displayed as follows:

- Details view

  The objects are displayed in a list with additional information, such as the date of the last change.

- List view

  The objects are displayed in a simple list.

- Icon view

  The objects are displayed as icons.

See also

Comparing objects (Page 192)

Showing or hiding additional columns (Page 192)

Comparing objects

You can display the contents of two folders or objects side by side in the Overview window. The Overview window is split in half and you can display different contents on the left and right sides.

In addition, you can use a drag-and-drop operation to move objects between the split windows. Thus, for example, you can move contents from one window to the other.

Procedure

To split the Overview window in half or cancel the split, follow these steps:

1. In the toolbar, click on the "Synchronize left side" or "Synchronize right side" icon to split the overview window. Either the left or the right side of the overview window synchronized with the contents of the selected object in the project tree.
2. To cancel the split, click again on the previously selected icon.

See also

Overview window (Page 190)

Showing or hiding additional columns

In the details view of the Overview window, you can display more columns containing additional information on an object and then hide them again. The columns available depend on the selected object.

Procedure

To show or hide additional table columns, follow these steps:

1. Right-click the title bar of the table.
2. Select the "Show/Hide" command in the shortcut menu, and select the columns you want to display.

See also

Overview window (Page 190)

6.1.2.10 Resetting the user interface layout

Every change you make to the layout of the user interface is saved. The changes are thus available even after a restart of the TIA Portal. For example, if you change the height and width of a text editor or the division of a table, your changes are retained so that you don't have to re-customize elements every time.

In some cases, however, it may be helpful to restore the original layout settings, for example, to suit the preferences of another user or if a different user interface layout is desired.

Procedure

To reset the user interface settings to the factory settings, follow these steps:

1. Select the "Settings" command in the "Options" menu.

   The "Settings" window is displayed in the work area.
2. Select the "General" group in the area navigation.
3. Click the "Reset to default" button under "Layout > Reset layout".

Result

The default settings for the user interface are restored.

Save a project under a different name	<Ctrl+Shift+S>	Project > Save as
Print project	<Ctrl+P>	Project > Print
Compile a project	<Ctrl+B>	Edit > Compile
Undo last action	<Ctrl+Z>	Edit > Undo
Redo last action	<Ctrl+Y>	Edit > Redo

Editing objects within a project

Function	Key combination	Menu command
Rename a project	<F2>	Edit > Rename
Highlight all objects in an area	<Ctrl+A>	Edit > Select all
Copy an object	<Ctrl+C>	Edit > Copy
Cut an object	<Ctrl+X>	Edit > Cut
Paste an object	<Ctrl+V>	Edit > Paste
Delete an object	<Del>	Edit > Delete
Find an object	<Ctrl+F>	Edit > Find and replace
Replace an object	<Ctrl+H>	-

Calling up the help function

Function	Key combination	Menu command
Calling up the help function	<F1> or <Shift+F1>	Help > Show help

6.1.3.2 Keyboard shortcuts for windows

Opening and closing windows

Function	Key combination	Menu command
Open/close project tree	<Ctrl+1>	View > Project tree
Opening/closing the detailed view	<Ctrl+4>	View > Details view
Opening/closing the overview	<Ctrl+2>	View > Overview
Opening/closing a task card	<Ctrl+3>	View > Task card
Open/close inspector window	<Ctrl+5>	View > Inspector window
Close all editors	<Ctrl+Shift+F4>	Window > Close all
Open the shortcut menu	<Shift+F10>	-

6.1.3.3 Keyboard shortcuts in the project tree

Keyboard shortcuts in the project tree

Function	Key combination
Jump to the start of the project tree	<Home> or <Page Up>
Jump to the end of the project tree	<End> or <Page Down>
Open folder	<Arrow Right>
Close folder	<Arrow Left>

6.1.3.4 Keyboard shortcuts in tables

General keyboard shortcuts in tables

Function	Key combination
Place a cell in edit mode	<F2> or <Return>
Open drop-down list in a cell	<Return>
Close drop-down list in a cell	<Esc>

Navigate in tables

Function	Key combination
Go to the next cell	<Arrow keys>
Go to the next editable cell on the right	<Tab>
Go to the next editable cell on the left	<Shift+Tab>

Function	Key combination
Move a screen upwards	<PgUp>
Move a screen downwards	<PgDn>
Go to the first cell in the row	<Home>
Go to the last cell in the row	<End>
Go to the first cell in the table	<Ctrl+Home>
Go to the last cell in the table	<Ctrl+End>
Go to the top cell in the column	<Ctrl+up arrow>
Go to the bottom cell in the column	<Ctrl+down arrow>

Highlighting areas in tables

Function	Key combination
Highlight a column	<Ctrl+space bar>
Highlight a row	<Shift+space bar>
Highlight all cells	<Ctrl+A>
Highlight to expand a cell	<Shift+arrow keys>
Extend highlighting to the first visible cell	<Shift+PgUp>
Extend highlighting to the last visible cell	<Shift+PgDn>
Extend highlighting to the first row	<Ctrl+Shift+up arrow>
Extend highlighting to the last row	<Ctrl+Shift+down arrow>
Extend highlighting to the first cell in the row	<Ctrl+Shift+left arrow>
Extend highlighting to the last cell in the row	<Ctrl+Shift+right arrow>

6.1.3.5 Keyboard shortcuts for text editing

Editing text

Function	Key combination
Switch to insert or overwrite mode	<Insert>
Exit edit mode	<Esc>
Delete	<Del>
Delete characters	<Backspace>

6.1.3.6 Using the on-screen keyboard

Introduction

When working with the TIA portal, you also have the Microsoft on-screen keyboard available.

Displaying the on-screen keyboard

To display the on-screen keyboard, follow these steps:

1. In the "View" menu, select the "Screen keyboard" command.

Exiting the on-screen keyboard

To exit the on-screen keyboard, follow these steps:

1. In the "File" menu of the on-screen keyboard, select the "Exit" command.

6.1.4 Special features specific to the operating system

6.1.4.1 Influence of user rights

Restrictions when user rights are limited

The software provides several functions that require direct access to the hardware of the programming device / PC and therefore also to the installed operating system. To make full use of the range of functions, the software must cooperate closely with the operating system. To ensure problem-free interaction, you should therefore be logged on to the operating system with adequate user rights.

In particular, you may not be able to use functions requiring an online connection or those that change the settings of interface cards if you work with limited user rights.

Recognizing restricted functions

You can recognize functions requiring special rights as follows:

- A shield icon is displayed beside the function.

  🛡

  The function can be used but is regulated by the user account control.
- A box is grayed out and cannot be accessed.

  You require administrator privileges to access the box. In some operating system environments, you can obtain administrator privileges by entering an administrator password.

Note

A box being grayed out does not necessarily mean a lack of rights. You should also check the additional information in the tooltip cascades to find out the conditions for editing the box.

6.1.4.2 Expanding user rights

Counteracting restrictions due to user rights

Certain functions may not be available if you are not logged on to the operating system with adequate rights. You can counteract these restrictions in the following ways:

- Enabling of extended rights using Windows user account control
- Logging on to the operating system with administrator privileges
- Using temporary administrator rights

Enabling extended rights using the Windows user account control

To be able to use a function indicated by the shield icon of the Windows user account control, follow these steps:

1. Click on the box or button with the shield icon.

   The security prompt of the Windows user account control opens.
2. Follow the instructions of the Windows user account control and, when prompted enter an administrator password, if possible.

The function can now be used once without restrictions.

Logging on to the operating system with administrator privileges

To be able to use a function that is disabled due to lack of user rights, follow these steps:

1. Close the software.
2. Log off from the operating system.
3. Log on to the operating system with administrator privileges.
4. Restart the software.

Using temporary administrator rights

To obtain administrator privileges temporarily, follow these steps:

1. Click the "Change settings" button. You will find this button in dialogs that allow the temporary assignment of administrator privileges.

   An operating system dialog box for entering an administrator password opens.
2. Enter an administrator password.

The settings can be temporarily changed. When you call the dialog again, the procedure must be repeated.

Note

This function is not supported by all operating systems. If no "Change settings" button is present or the button is grayed out, you will need to log on to the operating system with administrator privileges instead.

6.2 Help on the information system

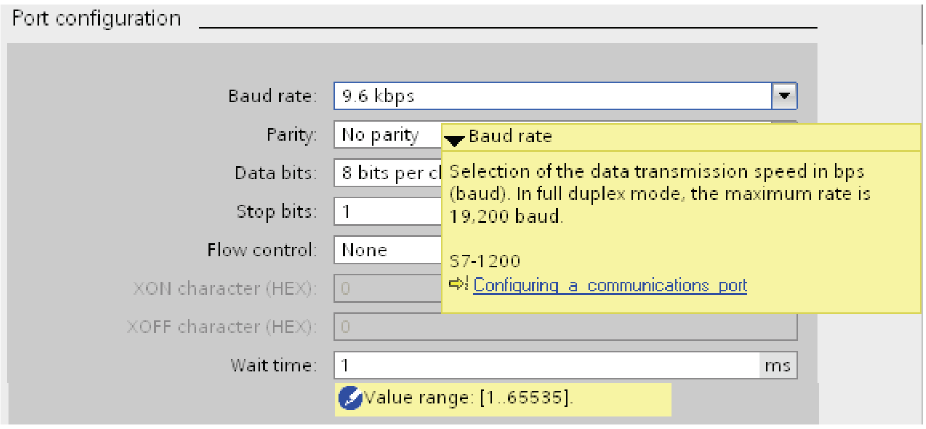
6.2.1 General remarks on the information system

Quick answers to your questions

A comprehensive Help system is available for solving your tasks. It describes basic concepts, instructions and functions. While working with the program, you also receive the following support:

- Roll-out for correct inputs in dialog boxes
- Tooltips for information on elements of the user interface, for example text boxes, buttons and icons. Some of the tooltips are supplemented by cascades containing more precise information.
- Help on the current context, on menu commands for example when you click on the keys <F1> or <Shift+F1>.

The following figure shows an example of a cascading tooltip (top) and a roll-out (bottom):



Port configuration

Baud rate: 9.6 kbps
Parity: No parity
Data bits: 8 bits per c
Stop bits: 1
Flow control: None
XON character (HEX): 0
XOFF character (HEX): 0
Wait time: 1 ms

Baud rate
Selection of the data transmission speed in bps (baud). In full duplex mode, the maximum rate is 19,200 baud.

S7-1200
Configuring a communications port

Value range: [1..65535].

Help

The Help system describes concepts, instructions and functions. It also contains reference information and examples. The help opens in a separate window.

A navigation pane appears on the left side of the help window. You can also hide the navigation pane to make room on the screen. The navigation pane provides you with the following functions:

- Table of contents
- Search in the index
- Full text search of the entire Help
- Favorites

Identification of the topics in the Help according to the type of information

The help topics are identified by different symbols depending on the type of information they contain.

Symbol	Information type	Explanation
⇨ 1. 2.	Operating instructions	Describes the steps to follow in order to carry out a particular task.
▶▶	Example	Contains a concrete example to explain the task.
▶▤	Factual information	Contains background information that you need to know to carry out a task.
↗	Reference	Contains comprehensive reference information to refer back to.

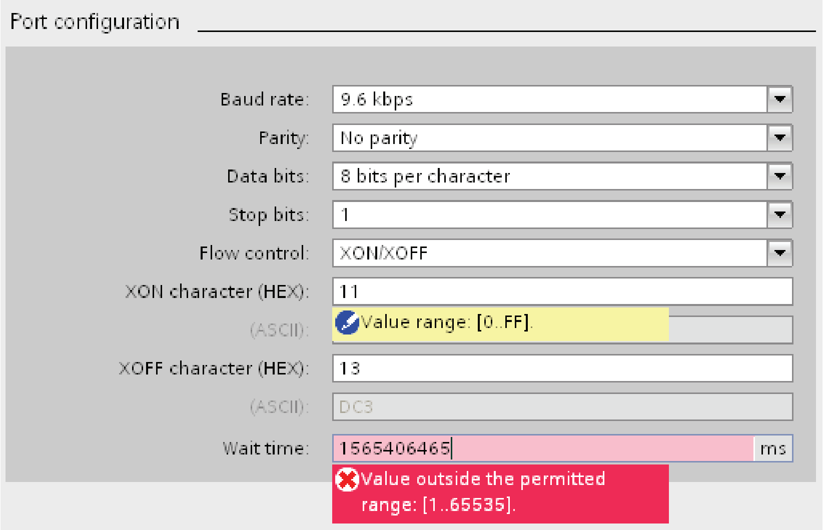
Identification of the topics in the Help according to the target system

Depending on the products that are installed, the help system may contain sections that apply only to specific devices. To be able to recognize such sections at a glance, you will find a note in brackets in the table of contents. The search results in the full text search and in the index are marked in the same way if they only apply to a specific device.

Roll-out

Certain text boxes offer information that rolls out and helps you to enter valid parameters and values. The roll-out informs you about permissible value ranges and data types of the text boxes.

The following figure shows a roll-out (yellow) and a roll-out error message (red), which indicates an invalid value:



Port configuration

Baud rate: 9.6 kbps

Parity: No parity

Data bits: 8 bits per character

Stop bits: 1

Flow control: XON/XOFF

XON character (HEX): 11

(ASCII): Value range: [0..FF].

XOFF character (HEX): 13

(ASCII): DC3

Wait time: 1565406465 ms

Value outside the permitted range: [1..65535].

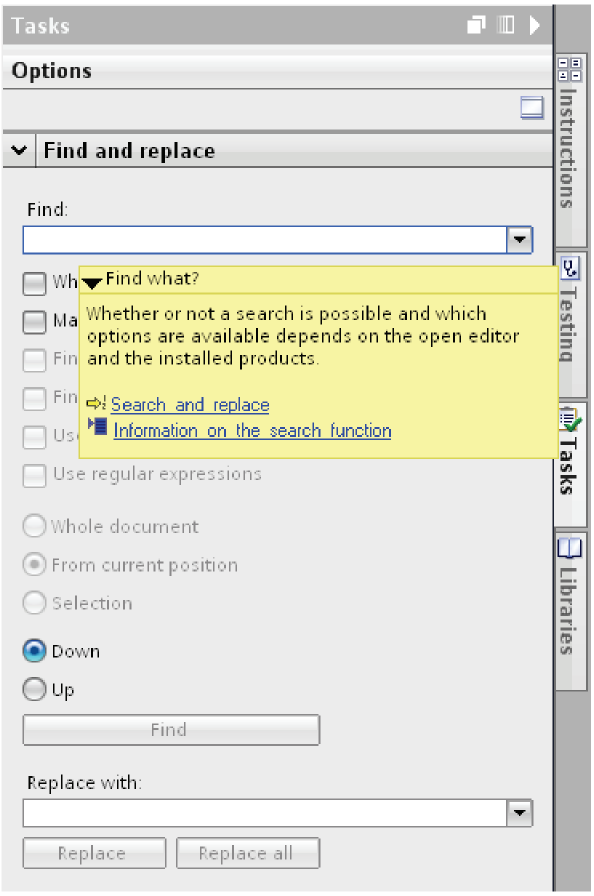
Tooltip

Interface elements offer you a tooltip for easier identification.

Tooltips, which have an arrow icon on the left, contain additional information in tooltip cascades. If you position the mouse pointer briefly over the tooltip or click the arrow icon, this information is displayed. The automatic display of tooltip cascades can be disabled.

If additional information is contained in the Help system, a link appears to the corresponding Help topic in the cascade. If you click on the link, the corresponding topic opens in Help.

The following figure shows a tooltip with opened cascade:



Find what?

Whether or not a search is possible and which options are available depends on the open editor and the installed products.

Search and replace
Information on the search function

□ Wh
□ Ma
□ Fin
□ Fin
□ Us
□ Use regular expressions

○ Whole document
● From current position
○ Selection

● Down
○ Up

See also

Disabling the automatic display of tooltip cascades (Page 206)

6.2.2 Opening the Help system

Opening the Help system

You can open the Help system in the following ways:

1. In the "Help" menu, select the "Show help" command or press <F1> to display the corresponding help for the current context.

Or

1. Click on the link in a tooltip cascade to go directly to an additional point in the Help system.

6.2.3 Searching the Help system for keywords

Searching for keywords in the help text

To search the help topics for predefined keywords, follow these steps:

1. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.

   The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
2. Open the "Index" tab.
3. Enter the search term in the input box or select the search term from the list of key words.
4. Click "Display".

6.2.4 Full-text searches

Full-text searches

To search the entire text for specific words, follow these steps:

1. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.

   The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.

2. Open the "Search" tab.
3. Type in your search term in the text box.
4. Refine your search if necessary using additional criteria:
   – Select "Search previous results" to start an additional search operation of your last search results only.
   – Select "Search for similar words" to find words that differ only slightly from your search term.
   – Select "Search titles only" to obtain only results that contain your search term in the title. The contents of the Help topics are ignored during the search.
5. Click on the arrow button to the right of the search field to use logic operations. The following logic operations are available:
   – Combine two or more search terms using the "AND" operator to find only Help topics that contain all the search terms in the text.
   – Combine two or more search terms using the "OR" operator to find only Help topics that contain one or more of the search terms in the text.
   – Combine two or more search terms using the "NEAR" operator to find only Help topics that contain terms in close proximity to each other (eight words).
   – Precede a word with the "NOT" operator to exclude Help topics from the search that contain this word.
6. Click on "List topics" to start the search.

   The results are now listed with title, position and ranking. The "Position" column shows the section in which the Help topic found is located. Sorting according to ranking is based on the position of the Help topics found in the table of contents and based on the number of hits in the Help topics.

6.2.5 Using favorites

Using favorites

You can save individual help topics as favorites. This saves you searching for the help topic a second time.

Saving favorites:

To save a page as a favorite, follow these steps:

1. Open the help topic or the chapter you want to save as a favorite.
2. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.

   The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
3. Open the "Favorites" tab.
4. Click the "Add" button.

   The help topic or chapter is saved as a favorite and is available the next time you open the help system.

Calling up favorites:

To call up a page from the favorites, follow these steps:

1. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.

   The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
2. Open the "Favorites" tab.
3. Select the topic you want to open from the list.
4. Click the "Display" button.

Deleting favorites

To delete an entry from the favorites, proceed as follows:

1. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.

   The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
2. Open the "Favorites" tab.
3. Select the topic you want to remove from the list.
4. Click the "Remove" button.

6.2.6 Printing help topics

Printing information

You can either print all the contents of the Help system or individual topics only.

Procedure

To select the topics you would like to print, follow these steps:

1. Click the "Display printing dialog" button.

   The table of contents opens in a separate window.
2. Select the check boxes for the folders and help topics to be printed in the "Print help topics" dialog.
3. Click the "Print" button to print the selected information.

   The "Print" dialog opens.
4. Select the printer on which you want print the help topics.
5. Click "Properties" if you want to make additional printer settings.
6. Confirm your entries with "OK".

   The help topics are printed out on the selected printer.

6.2.7 Disabling the automatic display of tooltip cascades

You can suppress the automatic display of tooltip cascades. Manual display remains possible.

Procedure

To disable the automatic display of tooltip cascades, follow these steps:

1. In the "Options" menu, select the "Settings" command.
2. Select the "General" group in the area navigation.
3. Disable the "Open cascade automatically in tooltips" check box in the "General settings".

If you want to display a tooltip cascade manually, click on the arrow icon within the tooltip.

6.2.8 Safety Guidelines

Safety guidelines

This Help manual contains you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER
indicates that death or severe personal injury will result if proper precautions are not taken.

⚠ WARNING
indicates that death or severe personal injury may result if proper precautions are not taken.

⚠ CAUTION
with a safety alert symbol, indicates that minor personal injury can result if proper precautions are not taken.

CAUTION
without a safety alert symbol, indicates that property damage can result if proper precautions are not taken.

NOTICE
indicates that an unintended result or situation can occur if the corresponding information is not taken into account.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The device/system may only be set up and used in conjunction with this documentation. Commissioning and operation of a device/system may only be performed by qualified personnel. Within the context of the safety notes in this documentation qualified persons are defined as persons who are authorized to commission, ground and label devices, systems and circuits in accordance with established safety practices and standards.

Prescribed Usage

Note the following:

⚠ WARNING
This device may only be used for the applications described in the catalog or the technical description and only in connection with devices or components from other manufacturers which have been approved or recommended by Siemens. Correct, reliable operation of the product requires proper transport, storage, positioning and assembly as well as careful operation and maintenance.

Trademarks

All names identified by ® are registered trademarks of the Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Editing projects 7

7.1 The basics of projects

Introduction

Projects are used to organize the storage of data and programs resulting from the creation of an automation solution. The data that makes up a project includes the following:

- Configuration data on the hardware structure and parameter assignment data for modules
- Project engineering data for communication over networks
- Project engineering data for the devices

Project hierarchy

Data is stored in a project in the form of objects. Within the project, the objects are arranged in a tree structure (project hierarchy).

The project hierarchy is based on the devices and stations along with the configuration data and programs belonging to them.

Common data of the project and online access, for example, are also displayed in the project tree.

Opening projects (Page 210)

Saving projects (Page 213)

Deleting projects (Page 214)

7.2 Creating and managing projects

7.2.1 Creating a new project

Procedure

To create a new project, follow these steps:

1. Select the "New" command in the "Project" menu.

   The "Create a new project" dialog opens.
2. Enter your project name and path or accept the proposed settings.
3. Click the "Create" button.

Result

The new project is created and displayed in the project tree.

See also

The basics of projects (Page 209)

Opening projects (Page 210)

Saving projects (Page 213)

Deleting projects (Page 214)

7.2.2 Opening projects

Procedure

To open an existing project, follow these steps:

1. Select the "Open" command in the "Project" menu.

   The "Open project" dialog opens and includes the list of most recently used projects.
2. Select a project from the list and click "Open".
3. If the project you require is not included in the list, click the "Browse" button. Navigate to the desired project folder, and open the project file. Projects of the TIA Portal V11 have the extension ".ap11", while older projects from the TIA Portal V10 have the extension "ap10".

Result

The project opens in the project view.

Notes on compatibility

When you open a project that was created with an older version of the TIA Portal, the project is converted automatically to the current file format and saved as a new project. The designation "_V11" is added to the file name of the new project.

If you want to open a project from a newer version, this is possible if the following conditions are met:

- The project was created with a different version of the TIA Portal V11, for example, a version with an installed service pack.
- The project does not contain any data that is incompatible with the current installation.

If the project to be opened contains data that was created with optional software, but the corresponding software product is not installed, the following cases can occur:

- Software components are missing, but none of them are essential:

  A dialog appears listing the missing software components. After the project is opened, its properties are displayed. You now have the opportunity to install the missing products. All the devices contained in the project are available even if you do not install the missing products. However, you can only work with the devices that are supported by the currently installed software.

  If devices are not supported because software is missing, they are marked with the following symbol in the project tree:

- At least one software package is required in order to open the project:

  A dialog appears listing the missing software components. The essential package(s) are marked. The project can only be opened if you install the missing components.

The basics of projects (Page 209)

Creating a new project (Page 210)

Saving projects (Page 213)

Deleting projects (Page 214)

7.2.3 Displaying properties of the project

You can display the properties of a project. Properties include the following:

- Metadata for the project

  This includes the following information: creation time, author, file path, project size, copyright , project languages, etc. Many of the attributes can be changed.

- Project history

  The project history contains an overview with important events in the project life cycle. Here you can also call the log file for a migration.

- Support packages in the project

  You can display an overview of the additional software needed to work with all devices in the project.

- Software products in the project

  You can display an overview of all installed software products needed for the project.

Procedure

To display the project properties, follow these steps:

1. Select the open project in the project tree.
2. Select "Properties" in the shortcut menu of the project.

   The dialog with the properties of the project opens.
3. Select the project properties in the area navigation that you want to have displayed.

7.2.4 Saving projects

You can save the project at any time either under the same or a different name. You can even save a project when it still contains elements with errors.

Saving a project

To save a project, follow these steps:

1. Select the "Save" command in the "Project" menu.

   All changes to the project are saved under the current project name.

Project Save as

To save a project under another name, follow these steps:

1. Select the "Save as" command in the "Project" menu.

   The "Save current project as" dialog opens.
2. Select the project folder in the "Save in" box.
3. Enter the new project name in the "File name" box.
4. Confirm your entry with "Save".

   The project is saved under the new name and opened.

See also

The basics of projects (Page 209)

Creating a new project (Page 210)

Opening projects (Page 210)

Deleting projects (Page 214)

7.2.5 Closing projects

Procedure

To close a project, follow these steps:

1. Select the "Close" command in the "Project" menu.

   If you have made changes to the project since the last time you saved it, a message is displayed.
2. Decide whether or not you want to save the changes.

7.2.6 Deleting projects

NOTICE
When you delete a project, the entire project data is removed from the storage medium.

Requirements

The project you want to delete is not open.

Procedure

Follow the steps below to delete an existing project:

1. Select the "Delete project" command in the "Project" menu.

   The "Delete project" dialog opens and includes the list of most recently used projects.
2. Select a project from the list.

   If the project you require is not included in the list, click the "Browse" button. Navigate to the required project folder, and open the project file with the extension ".ap11".
3. Click the "Delete" button.
4. Click "Yes" to confirm. This starts the deletion of the project.

Result

The entire project folder is deleted from the file system.

Saving projects (Page 213)

7.2.7 Working with multi-language projects

7.2.7.1 Project text basics

Texts in different languages in the project

When you enter texts while working on a project, you would normally do this in your own language. If you then pass on the project to someone else who does not know this language, this person will require a translation of the relevant texts to a language they know. This is why all texts can be translated. In this way, you can ensure that anyone who is subsequently confronted with the texts sees the texts in his/her language of choice.

Project language

Project languages are all languages in which a project will later be used. Based on the editing language, all the texts can be translated to the various project languages. You specify the languages that will be available in the project tree under "Languages & Resources > Project languages".

Editing language

Every project has an editing language. When you enter texts, these are always created in the editing language. You should therefore make sure that the editing language set is the language in which you enter the texts. This avoids problems if you translate the texts later.

The editing language does not depend on the language of the user interface. You could, for example, set English as the user interface language, but use Italian as the editing language. If you enter texts, these will be created in this case in the project language "Italian", although the user interface of the TIA Portal displays English.

You set the editing language in the project tree under "Languages & Resources > Project languages > Editing language".

User texts and system texts

For clarification purposes, a distinction is made between user texts and system texts:

- User texts are texts that the user created.
- System texts are texts that are created automatically according to the configuration in the project.

You manage the project texts in the project tree under "Languages & Resources > Project texts".

Examples of multilingual project texts

You can, for example, manage the following project texts in more than one language:

- Block titles and block comments
- Network titles and network comments
- Statement comments from STL programs
- Comments in tables
- Alarm texts
- Operator-relevant texts
- Text lists
- Labels of buttons
- Display names of recipes

Translating texts

There are three ways of translating texts.

- Translating texts directly

  You can enter the translations for the individual project languages directly in the "Project texts" table. You will find this in the project tree under "Languages & Resources > Project texts".

- Translating texts using reference texts

  You can change the editing language for shorter texts. All the text cells are filled again with the default values and can be filled in the current language. As orientation, you can display what you last entered in the box in the reference language. To do this, select the "Tasks" task card and open the "Languages & resources".

- Exporting texts and translating them externally

  With larger volumes of text, you can export the texts to an Office Open XML file and translate them with a normal table calculation program. You then import the translated texts again into the TIA Portal.

Note

Using Asian project languages

East Asian project languages are only displayed correctly in Windows XP, if the option "Install files for East Asian languages" is selected on the Languages tab of Regional and Language Options in the Control Panel of Windows XP Professional.

See also

Overview of the program settings (Page 162)

Changing the settings (Page 166)

Application examples for multilanguage projects (Page 222)

7.2.7.2 Select project languages

All the texts can be displayed within a project in the same language that you selected for your software user interface. This means that all project texts must exist in the corresponding language. You can select the available project languages yourself.

Requirement

- You are in the project view.
- A project is open.

Procedure

To select the project languages, follow these steps:

1. Click on the arrow symbol to the left of "Languages & Resources" in the project tree.

   The elements below this are displayed.
2. Double-click on "Project languages".

   In the work area, you will see a list of languages that you can select.
3. Select the required languages.

Result

All texts can be displayed in the activated languages if there is already a translation for these languages.

7.2.7.3 Setting the editing language

All the texts in the project are created in the editing language when they are entered. If you change the editing language, all future text input will be stored in the new editing language.

Requirement

- You are in the project view.
- A project is open.

Procedure

To change the editing language, follow these steps:

1. Click on the arrow symbol to the left of "Languages & Resources" in the project tree.

   The lower-level elements are displayed.
2. Double-click on "Project languages".

   The possible settings for the project languages are displayed in the work area.
3. Select the editing language in "General > Editing language".

7.2.7.4 Translating texts directly

If you use more than one language in your project, you can enter translations of individual project texts directly in the selected project languages. To allow this, there is a list for user texts and one for system texts with a column for every project language.

Requirement

- You are in the project view.
- A project is open.
- You have selected at least one further project language.

Procedure

To translate individual texts, follow these steps:

1. Click on the arrow symbol to the left of "Languages & Resources" in the project tree.

   The elements below this are displayed.
2. Double-click "Project texts".

   A list with the user texts in the project is displayed in the work area.
3. Click on "System texts" if you you want to edit the list of system texts rather than the user texts.
4. You can improve the clarity of the lists if you have a lot of texts.
   - To group identical texts and to translate them all at once, click the "Switch on/off grouping" button in the toolbar.
   - To hide texts that do not have a translation, click the "Filter for empty texts on/off" button in the toolbar.
   - To further limit the displayed project texts to certain devices, select the devices for which you want to display project texts in the drop-down list.
5. Enter the translation of the project texts in the relevant column.

Note

If there is no translation for a text in a particular language, the English text is displayed.

7.2.7.5 Translating texts using reference texts

Introduction

After changing the editing language, all texts are shown in input boxes in the new editing language. If there is not yet a translation available for the newly set language, the input boxes are empty or filled with default values.

If you enter text in an input box, this is saved in the current editing language. Following this, the texts exist in two project languages for this input field, in the previous editing language and in the current editing language. This makes it possible to create texts in several project languages.

You can display existing translations for an input box in other project languages. These serve as a comparison for text input in the current editing language and they are known as the reference language.

Note

The display of reference texts depends on the installed products and is not supported by every editor.

Requirement

There is at least one translation into a different project language for an input field.

Procedure

To display the translation of an input cell in a reference language, follow these steps:

1. In the "Tasks" task card, select the "Languages & Resources" pane.
2. Select a reference language from the "Reference language" drop-down list.

Result

The reference language is preset. If you click in a text box, translations that already exist in other project languages are shown in the "Tasks > Languages & Resources" task card.

See also

Application examples for multilanguage projects (Page 222)

7.2.7.6 Exporting and importing project texts

You can export project texts for translation and then reimport them. The texts are exported to an Office Open XML file with the extension ".xlsx". This can be edited in Microsoft Excel or a number of other spreadsheet programs.

The following export options are available:

- Exporting individual project texts
- Exporting all user texts or system texts at once

  In this case, the export can be additionally limited by categories.

Note

Row limit in Microsoft Excel

Note that Microsoft Excel 2003 supports a maximum of 65536 rows. Microsoft Excel 2007 supports up to 1048576 rows.

Exporting individual project texts

To export individual project texts, follow these steps:

1. Open the "Languages & Resources" folder in the project tree.

   The lower-level elements are displayed.
2. Double-click "Project texts".

   The project texts editor opens.
3. Choose the "User texts" or "System texts" tab in the editor, depending on which texts you want to export.
4. Select the project texts you want to export.
5. Click the "Export project texts" icon in the toolbar of the editor.

   The "Export" dialog box opens.
6. Choose the language you want to translate from in the "Source language" drop-down list.
7. Choose the language you want to translate to in the "Target language" drop-down list. The drop-down list contains the project languages you specified previously. If the required language is missing, you must first specify it in the project languages editor.
8. Specify a file path and a file name for the export file in the "Select file for export" input box.
9. Click "Export".

Exporting all system or user texts

To export all project texts, follow these steps:

1. Select the "Export project texts" command in the "Tools" menu.

The "Export" dialog box opens.

2. Choose the language you want to translate from in the "Source language" drop-down list.
3. Choose the language you want to translate to in the "Target language" drop-down list. The drop-down list contains the project languages you specified previously. If the required language is missing, you must first specify it in the project languages editor.
4. In "Select content", select the check box "User texts" to export user texts. To export system texts, select "System texts". To export both user texts and system texts, select both check boxes.
5. In "Select content", select the required text categories for the user texts or the system texts.
6. In the "Export file" input field, specify a file name for the export file.
7. In the "Path" input field, select a path in the data system to which the export file is to be saved.
8. Click "Export".

Importing project texts

To import a file containing project texts, follow these steps:

1. Select the "Import project texts" command in the "Tools" menu.

   The "Import" dialog box opens.
2. Select the path and the file name of the import file from the "Select file for import" field.
3. Select the "Import base language" check box if you have made changes to the base language in the export file and you want to overwrite the entries in the project with the changes.
4. Click "Import".

Application examples for multilanguage projects (Page 222)

7.2.7.7 Application examples for multilanguage projects

Introduction

Let us assume you are working in a team with colleagues some of whom speak English, some French and some German. You have created a project with the TIA Portal and have already created a functioning configuration.

To allow your other colleagues to be able to keep track of the project, you would like all devices being used to have comments in English and German. First, you would like to enter the comments in German. Following this, to save time and costs, you want to have the texts translated into English in a spreadsheet program by an external translation office.

In addition to this, you also want a single comment for a particular device in French so that your French-speaking colleague can continue working on this device.

The section below describes an example of how you can achieve this with the tools of the TIA Portal.

Translating the project into English

To enter the comments in German and to have them translated into English later, follow these steps:

1. Set the editing language to "German" and fill all the comment boxes with the relevant texts in German.

   On the device selected from the French-speaking colleague, enter, for example "Unser neues Gerät" in German first.

   All the comments are now stored in German.
2. Export all user texts to an Office Open XML file with the extension ".xlsx".
3. Have the user texts contained in the file translated into English in a spreadsheet program such as Microsoft Excel.
4. Import the file into the TIA Portal after it has been translated.

   All texts are now available in German and English.

Translating a single comment field to French

To translate an individual comment field to French, follow these steps:

1. Open the comment box for the device on which the French-speaking colleague will be working.
2. Open the "Languages & Resources" pane in the "Tasks" task card.
3. Set "French" as the editing language in the "Languages & Resources" pane. As the reference language, set, for example, "English".

   Since no translation has yet been installed in French, the comment box is empty. In the "Languages & Resources" pane, the English translation "Our new device" is displayed as a reference.
4. Orientating yourself on the English reference text enter "Notre nouvel appareil" in the comment box.

   The comment for this device is now available in the languages German, English and French.

7.3 Editing project data

7.3.1 Compiling and loading project data

7.3.1.1 Compiling project data

General information on compiling project data

Compiling project data

During compilation, project data is converted so that it can be read by the device. Hardware configuration data and program data can be compiled separately or together. You can compile the project data for one or more target systems at the same time.

The following project data must be compiled prior to loading:

- Hardware project data, for example, configuration data of the devices or networks and connections
- Software project data, for example, program blocks or process screens

Scope of the compilation

When you compile project data, you have the following options depending on the device involved:

- All
- Hardware configuration
- Software
- Software (rebuild all blocks)

See also

Compiling project data (Page 224)

Compiling project data

The following section describes the general procedure for compiling project data in the project tree. You will find details of how certain objects are compiled and any special points to note in the online help of the product.

Procedure

To compile project data, follow these steps:

1. In the project tree, right-click on the device for which you want to compile the project data.

2. Select the option you require in "Compile" submenu of the shortcut menu.

Note

Note that the options available to you depend on the selected device.

The project data is compiled. You can check whether or not the compilation was successful in the Inspector window with "Info > Compile".

Canceling compilation operation

You can cancel compilation at any time. Proceed as follows:

1. Click the "Cancel" button in the status bar next to the progress bar. If the TIA Portal is currently processing multiple asynchronous processes, you can use the Up or Down arrow to change to the progress display of the compilation operation you want to cancel.
2. Click "Yes" to confirm.

See also

General information on compiling project data (Page 224)

7.3.1.2 Downloading project data

General information on loading

Introduction

In order to set up your automation system, you must download the project data you generated offline to the connected devices. This project data is generated, for example when configuring hardware, networks, and connections or when programming the user program or when creating recipes. The first time you download, the entire project data is downloaded. During later loading operations, only changes are downloaded.

You can download the project data to the following destinations:

- Devices
- Accessible devices
- Memory cards

Depending on the object you want to download, you have the following options:

- All

  Both hardware configuration as well as software are downloaded to the destination.
- Hardware configuration

  Only the hardware configuration is downloaded to the destination.
- Software

  Only the objects that differ online and offline are downloaded to the destination.
- Software (all blocks)

  All blocks are downloaded to the destination.

You can also upload project data already contained in a device back to your project. You have the following options:

- Uploading a complete device

  All relevant data of the device is uploaded to the project.
- Uploading blocks and parameters

  Only the blocks and parameters from the device are uploaded to the project.

See also

Downloading project data to a device (Page 227)

Loading project data to an accessible device (Page 228)

Downloading project data to a memory card (Page 229)

Uploading project data from a device (Page 230)

Downloading project data to a device

The following section describes the general procedure for downloading project data to a device. You will find details of how certain objects are downloaded and any special points to note in the online help of the product.

Requirement

- The project data is consistent.
- Each device to which you want to download is accessible via an online access.

Procedure

To download the project data to the selected devices, follow these steps:

1. Select one or more devices systems in the project tree.
2. Right-click on a selected element.

   The shortcut menu opens.
3. Select the option you require in the shortcut menu of the "Download to device" submenu.

   Note

   Note that the options available to you depend on the selected device.

   When necessary, the project data is compiled.

   – If you had previously established an online connection, the "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for downloading.

   – If you had not previously established an online connection, the "Extended download to device" dialog opens, and you must first select the interfaces via which you want to establish the online connection to the device.

     See also: Establishing and canceling an online connection (Page 3074)
4. Check the messages in the "Load preview" dialog, and select the actions in the "Action" column, if necessary.

   NOTICE

   Performing the proposed actions while the plant is in operation can cause serious bodily injury and property damage in the event of malfunctions or program errors.

   Make sure that no dangerous situations can arise before you start the actions!

As soon as loading becomes possible, the "Load" button is enabled.

5. Click the "Load" button.
6. The loading operation is performed. The "Load results" dialog then opens. In this dialog, you can check whether or not the loading operation was successful and take any further action that may be necessary.
7. Click the "Finish" button.

Result

The selected project data was downloaded to the devices.

See also

General information on loading (Page 226)

Loading project data to an accessible device (Page 228)

Downloading project data to a memory card (Page 229)

Uploading project data from a device (Page 230)

Loading project data to an accessible device

The following section describes the general procedure for downloading project data to an accessible device in the project tree. You will find details of how certain objects are downloaded and any special points to note in the online help of the product.

Requirement

The accessible devices are displayed.

See also: Displaying accessible devices (Page 3071)

Procedure

To load project data to an accessible device, follow these steps:

1. In the project tree, drag the folder containing your device to the accessible device.

   The "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for downloading.

2. Check the messages, and select the actions in the "Action" column, if necessary.

NOTICE
Performing the proposed actions while the plant is in operation can cause serious bodily injury and property damage in the event of malfunctions or program errors. Make sure that no dangerous situations can arise before you start the actions!

3. As soon as loading becomes possible, the "Load" button is enabled.

4. Click the "Load" button.

   The loading operation is performed. The "Load results" dialog then opens. In this dialog, you can check whether or not the loading operation was successful and take any further action that may be necessary.

5. Click the "Finish" button.

See also

General information on loading (Page 226)

Downloading project data to a device (Page 227)

Downloading project data to a memory card (Page 229)

Uploading project data from a device (Page 230)

Downloading project data to a memory card

Requirement

The memory card is displayed.

See also: Accessing memory cards (Page 270)

Procedure

To download project data to a memory card, follow these steps:

1. Use a drag-and-drop operation in the project tree to take the project data you want to download and move it to the memory card.

   The "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for downloading.
2. Check the messages, and select the actions in the "Action" column, if necessary.

   As soon as loading becomes possible, the "Load" button is enabled.
3. Click the "Load" button.

   The loading operation is performed. The "Load results" dialog then opens. In this dialog, you can check whether or not the loading operation was successful and take any further action that may be necessary.
4. Click the "Finish" button.

See also

General information on loading (Page 226)

Downloading project data to a device (Page 227)

Loading project data to an accessible device (Page 228)

Uploading project data from a device (Page 230)

Uploading project data from a device

The following section describes the general procedure for uploading project data from a device. Which project data you can upload from a device depends on the products installed.

You have the following basic options for uploading project data from a device to your project:

- Uploading a device to a programming device or PC

  You can use this option to start with an empty project and upload existing project data directly from a device.
- Uploading from device

  Only certain project data are uploaded from the device to the project. You will find the project data that can be downloaded in the online help of the product.

Requirement

- A project is open.
- The hardware configuration and software to be downloaded have to be compatible with the TIA Portal. If the data on the device was created with a previous program version or with a different configuration software, please make sure they are compatible.

Uploading a device to a programming device or PC

To upload the complete device to your project, follow these steps:

1. Select the project name in the project tree.

   The "Upload device to PG/PC" command in the "Online" menu is then enabled.
2. In the "Online" menu, select the "Upload device to PG/PC" command.

   The "Upload device to PG/PC" dialog opens.
3. Select the type of interface you want to use for the load operation in the "Type of the PG/PC interface" drop-down list.
4. Select the interface to be used from the "PG/PC interface" drop-down list.
5. Click the "Configure interface" button to the right of the "PG/PC interface" drop-down list to adapt the settings for the selected interface.

   See also: Establishing and canceling an online connection (Page 3074)
6. In the accessible devices table, select the device from which you want to upload project data.
7. Click on "Load".

   Depending on the selected device, a dialog appears in which you have to enter additional information, such as the position of the module rack.

   The project data of the device is uploaded to the project. You can edit it offline and then download it to the device again.

Or:

1. Open the accessible devices in the project tree.

   See also: Displaying accessible devices (Page 3071)
2. Use a drag-and-drop operation in the project tree to move the accessible devices to the project.

   Depending on the selected device, a dialog appears in which you have to enter additional information, such as the position of the module rack.

   The project data of the device is uploaded to the project. You can edit it offline and then download it to the device again.

Uploading from device

To upload only certain project data from a device to your project, follow these steps:

1. Establish an online connection to the device from which you want to download the project data.

   See also: Establishing and canceling an online connection (Page 3074)
2. Select an element in the project tree that allows uploading of project data.

   As a result, the "Upload from device" command in the "Online" menu becomes enabled.
3. Select the "Upload from device" command in the "Online" menu.

   The "Upload preview" dialog box opens.
4. Check the messages in the "Upload preview" dialog, and select the necessary actions in the "Action" column.

   As soon as uploading becomes possible, the "Upload from device" button is enabled.
5. Click the "Upload from device" button.

   The loading operation is performed.

See also

General information on loading (Page 226)

Downloading project data to a device (Page 227)

Loading project data to an accessible device (Page 228)

Downloading project data to a memory card (Page 229)

7.3.2 Comparing project data

7.3.2.1 Basics of project data comparison

Function

You have the option of comparing project data of the same type in order to determine possible discrepancies. For example, you can compare a hardware configuration with another hardware configuration.

A simple online-online comparison is already performed when you establish an online connection. During this process, comparable objects in the project tree are marked with icons that represent the result of the comparison. Beyond this marking, you can use the comparison editor to compare project data and have detailed information displayed. You can also select actions for non-identical objects in the comparison editor.

In addition to the online-offline comparison, there is also an offline-offline comparison available. This allows you to compare project data of two devices within one project or from different projects.

Which project data you can compare depends on the products installed.

Comparison icons

The result of the comparison is indicated by means of icons. The following table shows the relevant icons and their meaning:

Icon	Meaning
❗	Folder contains objects whose online and offline versions differ
❓	Comparison result is not known
🟢	Online and offline versions of the object are identical
◐	Online and offline versions of the object are different
◖	Object only exists offline
◗	Object only exists online

7.3.3 Protecting project data

7.3.3.1 Protection concept for project data

Introduction

You can protect your project data from unauthorized access. These include, for example:

- Access protection for devices
- Copy and display protection of objects
- Restrictions for printouts of know-how-protected objects

Note that every protection mechanism is not available for all objects. How to protect specific objects is described in the online help of the product.

Revoking access rights for devices

If you want to execute a function that is password-protected by means of the device protection level, you are prompted to enter a password. When the password is entered correctly, you can execute the required function. You continue to have access rights on the device until you close the TIA Portal.

If you want to reactivate password protection while the TIA Portal is open, you can explicitly revoke the access rights for a device. As a result, certain functions for the protected device cannot be executed until the correct password is entered again. You specify the functions for which a password must be entered when you assign the device protection level.

See also

Printing project data (Page 254)

7.3.3.2 Revoking access rights for devices

Requirement

- A protection level has been set for the device.
- A protected function for the device has been enabled by entering the password.

Procedure

To revoke the access rights for the device, follow these steps:

1. Select the device for which you want to revoke access rights in the project tree.
2. Select the "Delete access rights" command in the "Online" menu.

Result

The access rights are revoked, and starting from now the user will be prompted to enter the password again to execute a password-protected function on the device. The function can only be executed if the correct password is entered.

If the device has an online connection, it will be disconnected.

See also

Protection concept for project data (Page 234)

7.3.4 Printing project contents

7.3.4.1 Documentation settings

Introduction

Once a project is created, the contents can be printed in an easy-to-read format. You may print the entire project or individual objects within the project. A well-structured printout is helpful when editing the project or performing service work. The printout can also be used for your customer presentations or as full system documentation.

You can prepare the project in the form of standardized circuit manuals and print it in a uniform layout. You can limit the scope of the printout. You have the option to print to the entire project, individual objects along with their properties, or a compact overview of the project. In addition, you can print the contents of an open editor.

Improving the printout with frames and cover pages.

You can design the appearance of the printed pages according to your own requirements, for example, with your company logo or company layout. You can create your own printout templates with frames that will surround the project data in the printout. You create the frames in an external layout program or an image editing program and save the file in PDF or EMF format. The file can then be imported as a background image. You can insert placeholders for data from previously entered document information on the background. These will be filled automatically with the appropriate metadata during printing.

If you want to avoid designing your own template, there are ready-made frames and covers pages available. These include templates complying with the ISO standard for technical documentation.

If you already have cover pages or frames from earlier versions of the TIA Portal or you have templates and cover pages in EMF or PDF file format, you can import these.

Modular structure of a printout

An printout generally consists of the following components:

- Cover page (only when printing from the project tree)
- Table of contents (only when printing from the project tree)
- Name and path of an object within the project tree
- Object data

Printout of the cover page or the table of contents can be deactivated in the "Print" dialog.

See also

Creating a frame (Page 242)

Creating a cover page (Page 242)

Editing cover pages and frames (Page 244)

Entering document information (Page 240)

7.3.4.2 Printout of project contents

Availability of print function

The following contents can be printed:

- An entire project in the project tree
- One or more project-related objects in the project tree
- Contents of an editor
- Tables
- Libraries
- Diagnostics view of the Inspector window

It is not possible to print in the following areas:

- Portal view
- Detailed view
- All tabs of the Inspector window, except the diagnostics view
- All task cards, except the libraries
- Most of the dialogs

Scope of printout

To be able to print, at least one printable element has to be selected.

If a selected object is printed, all subordinate objects are also printed. For example, if a device is selected in the project tree, all of its data is also printed.

When table contents are printed, all lines in the table in which a cell is selected are printed. In order to print one or more table columns, the desired columns must be selected. If no individual cells or columns are selected, the entire table is printed.

Limitations when printing

In general, it is possible to print all objects that can be visualized on the user interface. Conversely, this means that you cannot print objects that you do not have access to. If a printout fails, possible reasons may include the following:

- A valid license does not exist for displaying an object.
- There is no device description for an object.
- A software component needed to display an object is not installed.

See also

Printing project data (Page 254)

7.3.4.3 Changing the print settings

Changing the print settings

You can specify general print settings that are retained even after the TIA Portal is closed and re-opened. Some settings are dependent on the products installed. The following settings are possible in every case:

Always print table data as pairs of values

If this option is selected, tables are not printed in tabular format but rather as a pairs of key and value.

Example:

Object name	Property 1	Property 2
Object A	Value A1	Value A2
Object B	Value B1	Value B2

In this case, the printout has the following appearance:

Object A

Property 1: Value A1

Property 2: Value A2

Object B

Property 1: Value B1

Property 2: Value B2

Printing mask editors

- Always print data in tables

  All parameters of technology objects are printed in tabular format.

- Print mask graphics if possible

  If the utilized editor supports this function, the contents of the editor are not printed as a table but rather as a complete graphic as it appears on the screen.

Procedure

To change the print settings, follow these steps:

1. Select the "Settings" command in the "Options" menu.

   The "Settings" window is displayed in the work area.
2. Select the "General" group.
3. Select the desired default settings in the "Print settings" area.

   The changes are applied immediately and are retained for all projects, even after the TIA Portal is closed.

See also

Overview of the print settings (Page 165)

7.3.4.4 Specifying the print layout

Specifying the print layout

If you do not want to rely on ready-made print templates, you can specify your own cover page or your own layout for the individual pages. Your designs are saved together with the respective project.

Your designs for the cover page and your templates for the page layout can be found in the project tree under the "Documentation information" group. You will also find metadata on the project there under the entry "Document information". For subsequent print operations, you can customize the appearance of the printout in the "Print" dialog using the saved cover pages and page layout templates and the available metadata.

Designing the cover page

The cover page can be customized. You can insert a background graphic and provide placeholders for text on the page. The placeholders are automatically filled with data from a documentation information during printing.

Cover pages are located in the project tree under the "Documentation information > Cover pages" group.

Designing the content page

The regular pages of a printout can contain the following elements:

- Frame with static content, such as a company logo
- Place holders for text, such as the name of the project, the page number, and the time the printout was started

  Several different values for the individual placeholders can be specified in the document information. Other values, such as the project name, are preassigned and are inserted automatically during printing.
- Footnote

  The footnote is always output below the content area.
- Content area

  You can specify an area where the printed content is to be embedded.

The design of the content pages is saved in Frames. The individual frames are located in the project tree under the "Documentation information > Frames" group.

7.3.4.5 Entering document information

You can enter metadata in the document information for every project. In addition, a print frame and a cover page are specified in the document information. You can create different information, if required, to enable you to quickly switch between different document information containing different information, frames, cover pages, page sizes, and page orientations when printing. For example, this is useful if you want to generate printouts in different languages and different document information is provided for each language.

In the documentation editor, you can specify placeholders on the cover page or in the frame of the regular pages. These placeholders can be automatically replaced with metadata from the documentation information during printing.

The various document information are therefore part of the printing function and specify the print layout and print content.

Procedure

To add metadata, follow these steps:

1. To create new document information, double-click "Add new document information" under "Documentation information > Document information" in the project tree.

   The new document information is created and opened immediately.
2. Enter a name for the set in the "Name" field.
3. Fill in the individual fields with the metadata for the project.

7.3.4.6 Managing cover pages and frames

Using cover pages and frames

Uses for cover pages

You can give your plant documentation printouts a professional appearance by adding a cover page. You can design your own cover page or use ready-made cover pages. Ready-made cover pages can be adapted and stored again as a template.

Cover pages can be saved in global libraries where they are available for use across projects.

Cover pages are designed for use as a right printed page only.

Uses of frames

You can embed the regular pages of your plant documentation inside a consistently uniform page frame. The frame can contain placeholders for project metadata, which is stored in the document information. It can also contain graphic elements that you design yourself.

You can create your own frames or rely on ready-made page frames. You can adapt a ready-made page frame and then store it again as a new frame.

Like cover pages, frames can be saved in global libraries where they are available for use across projects.

Frames are designed for use on right printed pages only.

Cover pages and templates in the project tree

Cover pages and frames associated with the project are stored in the project tree under the entry "Documentation information". There are separate folders here for frames and cover pages.

The following actions are available in the project tree for cover pages and frames.

- Creating your own subfolders
- Copying and pasting
- Inserting cover pages and frames from the "Documentation templates" system library
- Copying cover pages and templates to a global library

Cover pages and templates in libraries

The "Documentation templates" system library contains a few cover pages and templates that are available in every project. The cover pages and templates can be moved from there to the project tree using a drag-and-drop operation. You can then adapt the cover pages and templates in the project tree according to the requirements of your project.

Cover pages and templates can be moved from the project tree to a global library. Afterwards, these are available in every project.

See also

Library basics (Page 272)

"Libraries" task card (Page 273)

Global library basics (Page 285)

Using ready-made frames and cover pages (Page 243)

Creating a frame

You can create any number of frames for each project. The frames are stored in the project tree below the "Documentation information > Frames" group. You can assign a frame to all document information. When you select document information for printing, its associated frame is used.

Procedure

To create a new frame, follow these steps:

1. Double-click the entry "Add new frame" below the "Documentation information > Frames" group in the project tree.

   The "Add new frame" dialog opens.
2. Enter a name for the frame in the "Name" field.
3. Choose the paper size from the "Paper type" drop-down list.
4. Choose whether the page is to be created in portrait or landscape format in the "Orientation" drop-down list.

Click the "Add" button.

Result

A new frame is created. The frame is then opened automatically in the documentation editor where it can be edited.

See also

Editing cover pages and frames (Page 244)

Creating a cover page (Page 242)

Creating a cover page

You can create any number of cover pages for the printout for each project. The cover pages are stored in the project tree below the the "Documentation information > Cover pages" group. You can assign a cover page to all document information. When you select specific document information for printing, its associated cover page is used.

Procedure

To create a new cover page, follow these steps:

1. Double-click the entry "Add new cover page" below the "Documentation information > Cover pages" group in the project tree.

   The "Add new cover page" dialog box opens.
2. Enter a name for the cover page in the "Name" field.
3. Choose the paper size from the "Paper type" drop-down list.
4. Choose whether the page is to be created in portrait or landscape format in the "Orientation" drop-down list.

Click the "Add" button.

Result

A new cover page is created. The cover page is then opened automatically in the documentation editor where it can be edited.

Editing cover pages and frames (Page 244)

Creating a frame (Page 242)

Using ready-made frames and cover pages

The TIA Portal comes with some ready-made frames and cover pages. These can change according to your wishes.

Procedure

To create and edit the ready-made frames and cover pages, follow these steps:

1. Open the "Global libraries" pane in the "Libraries" task card.
2. In the "Templates" folder, open the "Cover Pages" or "Frames" folder.
3. Drag a cover page or a frame from one of the folders into the project tree and drop it into one of the following folders:
   – For frames: "Document information > Frames"
   – For cover pages: "Document information > Cover pages".

   The ready-made frame or cover page can now be used in the project.
4. Double-click on the new entry in the project tree click to edit the frame or the cover page.

7.3.4.7 Designing cover pages and frames

Editing cover pages and frames

The documentation editor is a graphical editor which allows you to design frames and cover pages for your plant documentation. You can place images or text elements on the frame and the cover pages in the document editor. The text elements are either static or they are automatically filled during printing with the data from the document information that you have selected in the print dialog.

Procedure

To edit a cover page or a frame in the documentation editor, follow these steps:

1. In the project tree, double-click on the entry for an existing cover page or frame under the "Documentation information > Frames " or "Documentation information > Cover pages" group.

   The documentation editor opens.
2. Design the cover page or frame as desired.
3. Close the documentation editor.

   The changes to the cover page or frame are applied automatically.

Creating a cover page (Page 242)

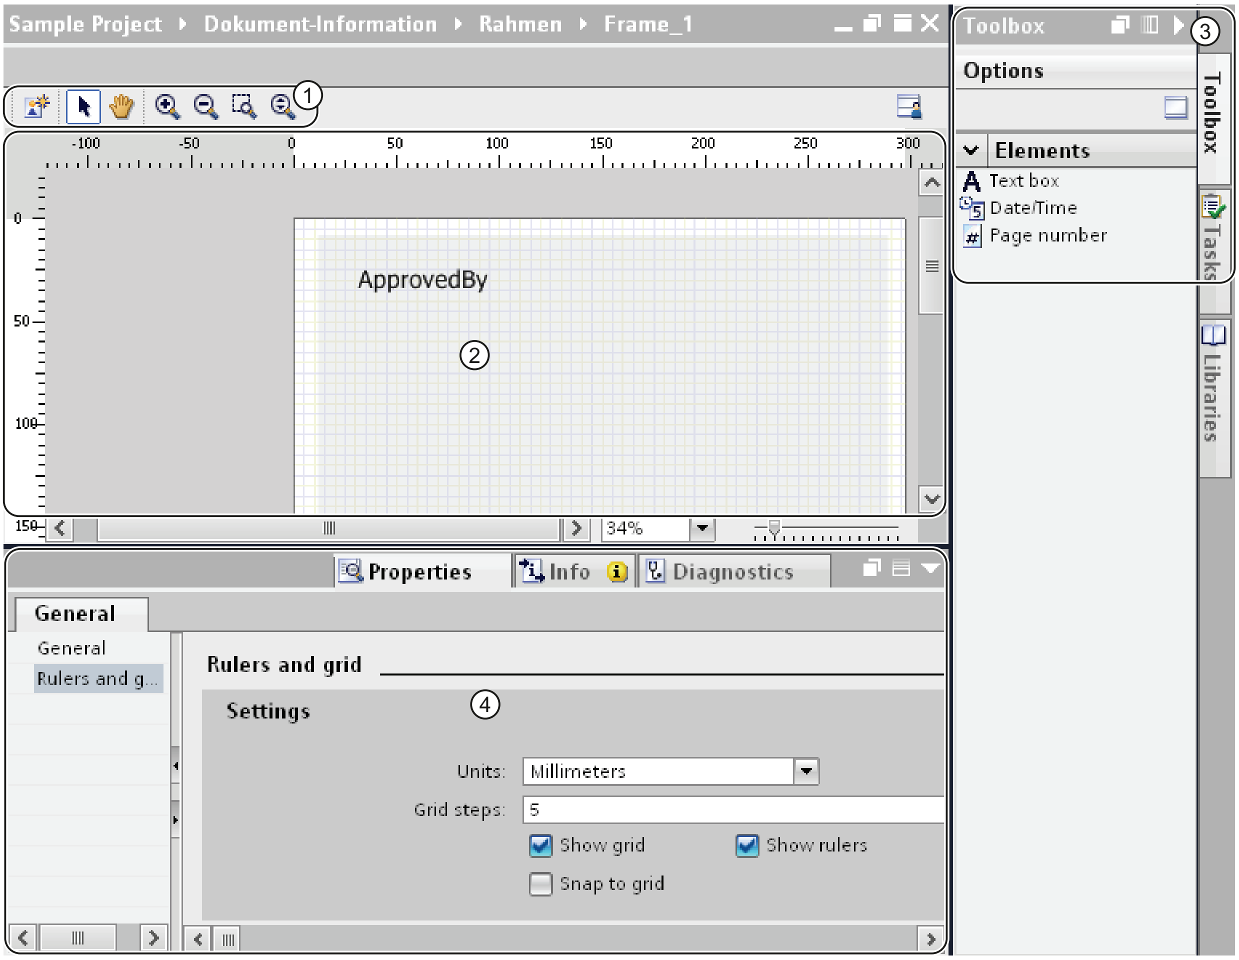
Creating a frame (Page 242)

General operation of the documentation editor (Page 245)

General operation of the documentation editor

Components of the documentation editor

The following figure provides an overview of the components of the documentation editor:



Units: Millimeters

Grid steps: 5

☑ Show grid ☑ Show rulers

☐ Snap to grid

① Toolbar

The toolbar provides the following tools (from left to right):

- Insert background image

  Inserts a background image into the template or cover page.
- Arrow tool

  Enables object selection.
- Navigation tool

  Allows shifting of the partial page.
- Zoom-in button

  Magnifies the page display incrementally.
- Zoom-out button

  Reduces the page display incrementally.
- Selecting a zoom factor

  Adapts the page size to the area selected with the lasso zoom tool.
- Dynamic zoom

  Adapts the page width to the work area.

② Work area

You can design the cover page or frame in the work area.

③ "Toolbox" task card

The "Toolbox" task card contains various types of placeholders that you can use on the cover sheet or frame. The placeholders can be placed in the work place using a drag-and-drop operation.

④ Properties in the Inspector window

You can display and modify the properties of the currently selected object in the "Properties" tab of the Inspector window. For example, you can modify the properties of the page, format text, specify the position of objects on the page, etc.

Operation in the documentation editor

The following basic functions are available in the documentation editor:

- Drag-and-drop functionality

  The documentation editor is a graphic editor, which means you can place objects anywhere with the mouse. An image of the page is displayed in the work area. This image corresponds to the ultimate print layout.

  If you want to select objects on the page in order to move them or modify their properties, the arrow tool must be activated in the toolbar.

- Zoom function

  You can use the zoom function to change the size of the page display. You have two options for changing the page size:

  – Via the buttons in the toolbar

    Select the "Zoom in" or "Zoom out" magnifying glass button in the toolbar of the documentation editor. Then click on the page in order to magnify (zoom in) or reduce (zoom out) the page incrementally.

    To zoom in on a particular area, select the "Select zoom factor" tool and use the mouse to drag an outline around the area you want to focus on.

    To continuously zoom in or zoom out of the work area, use the "Dynamic zoom" tool. To magnify the page display, click anywhere on the work area, and then hold down the mouse button while dragging the mouse toward the top of the page. To reduce the page display, drag the mouse toward the bottom of the page.

  – Via the zoom bar

    You can also use the zoom bar (located in the bottom right corner of the work area) to change the display size. Choose a percentage value from the drop-down list or enter a percentage value. Alternatively, you control the display size using the slider.

- Navigation over the page

  In addition to scrolling, you the option of changing the partial page with the navigation tool. To change the partial page with the navigation tool, select the Hand button in the toolbar. Then, click anywhere on the page and hold the mouse button down while moving the page to the desired position.

Using and adapting the positioning aids

You have various aids at your disposal to help you position elements on the page:

- Rulers

  Rulers are affixed to the page margins in the work area.
- Page grid

  A grid is placed underneath the page in the work area.

You can display, hide or adapt the positioning aids in the Inspector window under "Properties > Rulers and grid". You can make the following settings:

- Units:

  Specify the unit of measurement for the grid and the rulers.
- Grid steps:

  Specify the width of the grid.
- Show grid:

  Specify whether the grid is to be displayed or hidden.
- Snap to grid:

  Specify whether objects are to be aligned automatically to the grid. If the option is selected, the grid lines function like a "magnet".
- Show rulers:

  Specify whether the rulers are to be displayed.

Inserting a background image (Page 248)

Specifying the print area (Page 249)

Inserting placeholders for metadata (Page 250)

Inserting a background image

You can specify a background image for a cover page or frame. You can design the background image in another program and then insert it.

The background image is inserted in its original size. To keep it from extending beyond the margins, make sure that the background image is already correctly sized when you save it.

Requirement

- The background image must be in EMF or PDF format.
- A cover page is open in the documentation editor.

Procedure

To insert a background image, follow these steps:

1. Click the "Add background image" button.

   The "Open" dialog box opens.
2. Select the background image in the file system.
3. Click the "Open" button.

   The background image is inserted in its original size at the top left page margin.

Creating a cover page (Page 242)

General operation of the documentation editor (Page 245)

Specifying the print area

An area within the frame is provided for the actual printed contents. The project data is then always inserted inside this defined and uniformly consistent area within the frame. You can adjust the size of the print area.

Requirement

A frame is open in the documentation editor.

Procedure

To define an area for the printed contents, follow these steps:

1. Click on the slightly darker area within the page display in the documentation editor to select the area for the print content.

   This opens the properties of the area to be printed in the Inspector window.
2. Enter the position of the print area on the X and Y axes in the Inspector window.
3. Specify the width and height of the print area in cm in the Inspector window.

Alternatively, you can change the width and position of the print area in the graphic display of the page. To do so, use the mouse to drag the margins of the print area until the desired size and position are achieved.

See also

Creating a frame (Page 242)

General operation of the documentation editor (Page 245)

Inserting placeholders for metadata

You can provide placeholders on the cover page and in a frame. The placeholders are automatically filled with metadata from documentation information during printing, if they are placeholders for text. Alternatively, you can add non-modifiable data, such as free text or an image.

All elements are arranged in numbered Z-Orders. If objects overlap, you can determine in which sequence these are to be arranged.

Types of placeholders

The following types of placeholders are available to you:

- Text field

  The text field stands as a placeholder for a text element from a document information. In the properties of the text field, you set which text from a document information should be automatically inserted during printing.
- Field for date and time

  A date and time is inserted instead of the placeholder when printing. This can be the date of creation or the point in time when the last change was made to the project. In the properties of the Inspector window, you specify which date or time is printed.
- Page number

  The correct page number is automatically applied when printing.
- Free text

  You can enter freely selectable text in the properties of the text field. The text is static and is not influenced by the document information selected at the time of printing.
- Image

  Select the image file in the properties of the placeholder in the Inspector window. Images in the formats BMP, JPEG, PNG, EMF or GIF are possible.

Requirement

An cover page or frame is open in the documentation editor.

Procedure

To insert placeholders for metadata on the cover sheet or in a frame, follow these steps:

1. Drag a field from the "Toolbox > Elements" task card to the work area of the documentation editor.

   The placeholder is inserted. The placeholder properties are shown in the Inspector window and can be edited there.
2. Select the metadata to be inserted during printing from the "Text" drop-down list in the Inspector window under "Properties > General > Text box". Alternatively, you have the option of entering free text or selecting an image depending on the type of placeholder.
3. In the Inspector window under "Properties > General > Position and size", specify the position of the placeholder on the X and Y axis and enter the width and height of the text box in cm. You specify the sequence of the objects in the "Z-Order" field, if these overlap. The smaller the value, the further down an object is located.
4. In the Inspector window, go to "Properties > View" and select the font formatting and the orientation of the text as well as the alignment of the text. You cannot make this setting for images.

7.3.4.8 Displaying print preview

Creating a print preview

Creating a print preview

You can create a preview of the printout. Document information can be chosen for this, in the same way as as for the actual printout. In this way, you preview the selected frame and, if applicable, the cover sheet. The settings are retained for later printing.

Procedure

To create a print preview and to set the scope of the later printout, follow these steps:

1. Select the "Print preview" command in the "Project" menu.

   The "Print preview" dialog opens.

2. Select the frame layout you want to use for the printout.

   – In the "Document information" drop-down list, select the documentation information you want to use later for the printout.

   – Select the "Print cover page" check box to print the cover page, which is specified in the selected document information.

   – Select the "Print table of contents" check box to add a table of contents to the printout.

   The check boxes for printing the cover page and the table of contents can only be selected if you have started the printout in the project tree.

3. Under "Print objects/area", select what is to be printed. The selection is only possible if you have started the printout from an editor that supports this function.

   – Choose "All" to print out the entire content of the editor.

   – Choose "Selection" to print only the objects currently selected in the editor.

4. Select the print scope under "Properties".

   – Choose "All" to print all configuration data of the selected objects.

   – Choose "Visible" to print the information of an editor that is currently visible on the screen. This option can only be chosen if you have started the printout from an editor that supports this function.

   – Choose "Compact" to print out an abbreviated version of the project data.

5. Click "Preview" to generate the preview.

   A print preview is created in the work area.

   Note

   Wait time for extensive documents

   It can take several minutes to generate the print preview in the case of very extensive projects. You can continue working normally in the meantime on systems with adequate resources. The progress of the print preview is shown in the status bar.

See also

Operation within the print preview (Page 253)

Operation within the print preview

Functions within the print preview

The print preview shows an exact image of the subsequent printout. You can use the buttons in the toolbar to modify the print preview display. The following functions are available (from left to right):

- Navigation mode

  Allows shifting of the partial page.

  To change the partial page with the navigation tool, select the arrow button in the toolbar. Then, click anywhere on the page and hold the mouse button down while moving the page to the desired position.

- Zoom function

  - "Zoom in" and "Zoom out"

    Magnifies or reduces the page display.

    To zoom in or zoom out the display incrementally, select the corresponding button. Then click on the page in order to magnify (zoom in) or reduce (zoom out) the page incrementally.

    To zoom in on a particular area, select the "Lasso zoom" button and use the mouse to drag an outline around the area you want to focus on.

    To select an area to focus on, select the button "Zoom in / zoom out with rectangle". With the mouse, drag a border around the area to focus on it.

    To zoom dynamically through the page, select the button "Zoom in / zoom out dynamically". With pressed mouse button, scroll down over the page to zoom in. Scroll up to zoom out.

  - Percentage value in the drop-down list

    Specifies the display size of the page in percent.

    Enter a percentage value or select a percentage value from the drop-down list. Alternatively, choose the the "Fit to page" option from the drop-down list to adapt the page size to the work area. Or, choose "Fit to width" to adapt the page width to the work area.

- "Forward" and "Backward":

  Each change in the partial page, the page count, or the display size is saved in a history in the background. You can use the "Forward" or "Backward" button to return to the previous view or the next view.

- Page navigation

  - "First page"

    Jumps back to the first page.

  - "Previous page"

    Goes one page back.

  - "Page number" input field

    Shows the current page. To jump directly to a page, enter the page number of the page you want to view.

  - "Next page"

    Goes to the next page.

  - "Last page"

    Jumps to the last page.

See also

Creating a print preview (Page 251)

7.3.4.9 Printing project data

You have two options for printing out project data:

- Print immediately using default settings by means of the "Print" button in the toolbar.

  The button is only active if a printable object is selected.

- Printout with additional setting options with the "Project > Print" menu command.

  For example, you can choose a different printer or specific documentation information or you can specify whether a cover page and table of contents are to be printed. In addition, you can specify the print scope or display a print preview prior to printing.

Requirement

- At least one printer is configured.
- The objects to be printed are not protected.

  If printing is restricted by access protection, you must temporarily cancel the password protection in order to release the objects for printing. Otherwise, protected objects will not be included in the printout.

Printing project data

To print out data from the current project or the entire project with additional setting options, follow these steps:

1. Select the entire project in the project tree in order to print out the entire project. To print only individual elements within a project, select them in the project tree.
2. Select the "Print" command in the "Project" menu.

   The "Print" dialog opens.
3. Select the printer in the "Name" box.
4. Click "Advanced" to modify the Windows printer settings.
5. Select the frame layout you want to use for the printout.
   – Select the documentation information in the "Document information" drop-down list.

     The frame stored in the document information is used for the printout. All placeholders within the chosen frame are filled with the metadata from the selected document information.

   – Select the "Print cover page" check box to print the cover page, which is stored in the selected document information.

   – Select the "Print table of contents" check box to add a table of contents to the printout.

   The check boxes for printing the cover page and the table of contents can only be selected if you have started the printout in the project tree.
6. Under "Print objects/area", select what is to be printed. The selection is only possible if you have started the printout from an editor that supports this function.
   – Choose "All" to print out the entire content of the editor.

   – Choose "Selection" to print only the objects currently selected in the editor.
7. Select the print scope under "Properties".
   – Choose "All" to print all configuration data of the selected objects.

   – Choose "Visible" to print the information of an editor that is currently visible on the screen. This option can only be chosen if you have started the printout from an editor.

   – Choose "Compact" to print out an abbreviated version of the project data.
8. Click "Preview" to generate a print preview in advance.

   A print preview is created in the work area.
9. Click "Print" to start the printout.

Note

Scope of the "Print" dialog

The options available in the "Print" dialog vary depending on the elements to be printed.

Result

The project data is prepared in the background for printing and then printed on the selected printer. The status bar shows the progress of the print operation. You can continue working normally while data is being prepared for printing.

The print results and any errors or warnings are listed in the Inspector window under "Info" at the conclusion of the print job.

Canceling a print job

To cancel an active print job, follow these steps:

1. Click the red "X" in the status bar next to the progress display for the printout.

   The printout is cancelled promptly.

7.4 Undoing and redoing actions

7.4.1 Basics of undoing and redoing actions

Function

You can undo performed actions at any time. For this purpose, every action you perform is saved in an action stack. When undoing actions, the stack is processed from top to bottom. In other words, if you undo an action that lies further down in the stack, all actions located above it in the stack will also be undone automatically.

You can redo previously undone actions until you execute a new action. Once you execute a new action, it is no longer possible to redo previously undone actions.

Particularities for undoing

There are a few actions that empty the action stack. You cannot undo these actions or the actions performed before these actions. The following actions empty the action stack:

- Saving
- Project management (creating a new project, opening project, closing a project, deleting a project)
- Compiling
- Restoring blocks
- Establishing an online connection
- Loading
- Writing to memory cards

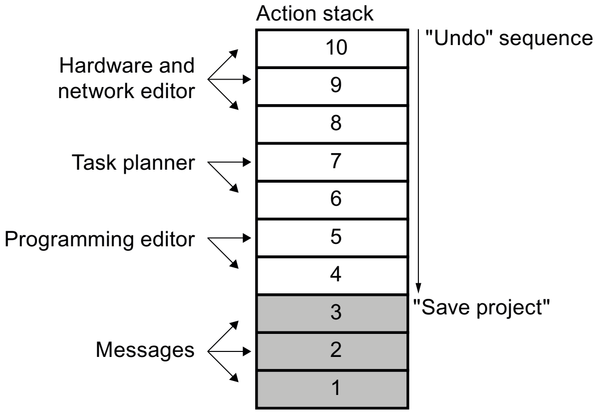
Displaying the action stack

The "Undo" button in the toolbar is enabled as soon as you perform an action that can be undone. This button is split; you can use the arrow down portion to open a drop-down list containing all actions of the action stack that you can undo. If you had performed actions in an editor other than the currently displayed editor, the corresponding editor is also displayed as a subheading. This allows you to always identify the point at which the undo operation will be applied. The subheadings are removed from the list when the editor responsible can no longer undo actions.

Actions you have undone are entered in the action stack from where they can be redone. Here, you can redo actions you have undone. The display of actions you can redo it is analogous to the display of the actions that you can undo.

Example of undoing actions

The figure below shows how actions performed in various editors and tables are undone:



In this example, you cannot undo actions 1 to 3 because the project was saved. You can undo actions 4 to 10 in the order indicated by the direction of the arrow. In other words, you must undo action 10 first. Once you have undone action 8, you cannot then undo action 5. You must first undo actions 7 and 6. As the final step in the sequence, you can then undo action 4. You also have the option of undoing several actions in a single step by undoing an action located further down in the action stack. All actions located above it in the stack will be undone automatically.

The same principle also applies to redoing of actions.

See also

Undoing an action (Page 259)

Redoing an action (Page 260)

7.4.2 Undoing an action

The following options are available for undoing actions:

- Undoing the last action only

  Only the last action performed is undone.
- Undoing as many actions as required

  Multiple actions in the action stack are undone in a single step.

Undoing the last action only

To undo the last action performed, follow the steps below:

1. Click the "Undo" button in the toolbar.
   - If the action was not performed in the currently displayed editor, a confirmation prompt appears.
   - If the undo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
2. Click "Yes" to confirm.
3. Enter the password, if necessary.

   The editor in which the action was performed is displayed and the action is undone.

Undoing as many actions as required

To undo multiple actions in the action stack in a single step, follow these steps:

1. Click the Down arrow next to the "Undo" button in the toolbar.

   This opens a drop-down list containing all actions you can undo. Actions performed in other editors are identified by the editor name in the subheading.
2. Click the action you want to undo.

   The chosen action and all actions in the stack located above the chosen action are undone. If the undo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
3. Enter the required passwords, if necessary.

   The editors in which the actions were performed are displayed and the actions are undone.

See also

Basics of undoing and redoing actions (Page 257)

Redoing an action (Page 260)

7.4.3 Redoing an action

You have the option of redoing an action that has been undone, so that you can return to the status present before "Undo" was performed. However, this is only possible until you perform a new action. The following options are available for redoing actions:

- Redoing the last undone action only

  Only the last undone action is redone.
- Redoing as many undone actions as required

  Multiple undone actions in the action stack are redone in a single step.

Redoing the last undone action only

To redo the last undone action, follow the steps below:

1. Click the "Redo" button in the toolbar.
   - If the action is not being redone in the currently displayed editor, a confirmation prompt appears.
   - If the redo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
2. Click "Yes" to confirm.
3. Enter the password, if necessary.

   The editor in which the action was undone is displayed and the action is redone.

Redoing as many undone actions as required

To redo multiple undone actions in the action stack in a single step, follow these steps:

1. Click the Down arrow next to the "Redo" button in the toolbar.

   This opens a drop-down list containing all actions you can redo. Actions performed in other editors are identified by the editor name in the subheading.
2. Click the action you want to redo.

   The chosen action and all actions in the stack located above the chosen action are redone. If the redo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
3. Enter the required passwords, if necessary.

   The editors in which the actions were undone are displayed and the actions are redone.

Basics of undoing and redoing actions (Page 257)

Undoing an action (Page 259)

7.5 Finding and replacing in projects

7.5.1 Information on the search function

Find and replace

You can search for texts in the editors. The search function finds all texts containing the search key in the currently opened editor. The results are selected in sequence in the opened editor.

You also have the following options:

- Narrowing down the search with additional options
- Replacing found texts

The additional options and the type of texts for which you can search depend on the installed products and the currently open editor.

See also

Search and replace (Page 262)

7.5.2 Search and replace

Using Find

The "Find and replace" function enables you to search for or replace texts in an editor.

Additional options for searching

You can narrow down your search by selecting one of the following additional options:

- Whole words only

  Only whole words are found. Words that contain the search key as part of the word are ignored.

- Match case

  Upper- and lowercase letters are taken into account in the search.

- Find in substructures

  The search also includes texts contained in another object.

- Find in hidden texts

  Texts that are assigned to another text but that are currently hidden are also included in the search.

- Use wildcards

  Enter an asterisk as the wildcard for any number of characters. Example: You want to search for all words starting with "Device". Type in "Device*" in the search key box.

  Enter a question mark as the wildcard, however, if you only want to leave out a single character.

- Use regular expressions (for searching in scripts only)

  A regular expression is a character string used to describe sets of values and for filtering. This allows you to create complex search patterns.

The additional options available depend on the installed products and the editor opened.

Start search

Follow these steps to start the "Find and replace" function:

1. Select the "Find and replace" command in the "Edit" menu or open the "Find and replace" pane in the "Tasks" task card.

   The "Find and replace" pane opens.

2. Enter a term in the "Find" drop-down list.

   As an alternative, you can select the most recent search key from the drop-down list.

3. Select the options desired for the search.

4. Using the option buttons, select the starting point for the search and the search direction.
   – Select "Whole document" if you want to search through the entire editor regardless of the current selection,
   – Select "From current position" if you want to start the search at the current selection.
   – Select "Selection" if you only want to search within the current selection.
   – Select "Down" to search through the editor from top to bottom or from left to right.
   – Select "Up" to search through the editor from bottom to top or from right to left.
5. Click "Find".

   The first hit is marked in the editor.
6. Click "Find" again to display the next hit.

   The next hit is marked in the editor. Repeat this process, as necessary, until you reach the last hit.

Replacing the search key

You have the option of replacing hits individually or automatically replacing all the found texts, if the respective editor supports this function. Follow these steps to replace terms:

1. Enter a term in the "Find" drop-down list.

   As an alternative, you can select the most recent search key from the drop-down list.
2. Select the options desired for the search.
3. Click the "Find" button to start a search for the specified search key.

   The first hit is displayed in the editor.
4. In the "Replace" drop-down list, enter the text you wish to use to replace the search key.

   As an alternative, you can select the most recently text specified from the drop-down list.
5. Click the "Replace" button to replace the selected hit with the specified text.

   The found text is replaced and the next hit is marked in the editor.

   Repeat this process until you have replaced all the hits as wanted. To skip to the next hit without replacing the marked word, click the "Find" button instead of "Replace".
6. Click "Replace all" to automatically replace all hits at once.

Information on the search function (Page 261)

7.6 Working with text lists

7.6.1 Text lists

Introduction

You can manage texts to be referenced in alarms centrally. All the texts are stored in text lists. Each text list has a unique name with which you can call up its content. A range of values is assigned to each text in a text list. If a value from a range of values occurs, the corresponding text is called up.

All the texts can be translated to all project languages. Here, you have two options available:

- You can enter the translation of the texts in a list. You will find the list in the project tree under "Languages & Resources > Project texts".
- You can export all texts to a file in Office Open XML format and enter the translation in a spreadsheet program. The translations can then be imported again.

The texts are translated into the other project languages within the framework of the project texts. In the text lists editor, you only have to manage the assignment of individual texts to a text list.

Each device in the project has its own text lists. For this reason, these lists are arranged under the devices in the project tree. In addition, there are text lists that apply to all devices. These can be found in the project tree under "Common data > Text lists".

User-defined and system-defined text lists

There are two types of text lists:

- User-defined text lists

  You can create user-defined text lists yourself and fill them with texts; in other words, you can specify value ranges and the corresponding texts yourself. With user-defined text lists, the name of the text list begins with "USER" as default. You can change this name to any suitable name.

- System-defined text lists

  System-defined text lists are created by the system. These always involve texts relating to devices. They are automatically created as soon as you insert a device in the project. With system alarms, the name of the text list begins with "SYSTEM". The name of the text list and the ranges of values it contains cannot be modified. You can only edit texts assigned to individual value ranges.

User-defined text lists	System-defined text lists
A user-defined text list can only be assigned to one device.	System-defined text lists can be assigned both to a device as well as to the entire project.
You can create new text lists and delete existing text lists.	You cannot create new text lists or delete text lists.
You can add and delete value ranges in the text lists.	You cannot add or delete value ranges in the text lists.
You can specify both the value ranges as well as the associated texts.	You can only edit the text associated with one value range.

Device-specific and cross-device text lists

Device-specific text lists relate to only one device in the project and are therefore only valid for this device. For this reason, they are arranged under a device in the project tree. Device-specific text lists can be used-defined or created by the system.

If system-defined text lists are generally valid for several devices or not intended uniquely for one device, these are grouped together in the project tree under "Common data". These text lists are available for all devices. Cross-device text lists are always created by the system and are used solely for system diagnostics alarms. For this reason, you cannot store any user-defined text lists under "Common data".

See also

Exporting and importing project texts (Page 220)

7.6.2 Creating user-defined text lists

Creating text lists

You can create user-defined text lists for individual devices.

Requirement

- You are in the project view.
- A project is open.
- The project includes a least one device.

Procedure

To create user-defined text lists, follow these steps:

1. Click on the arrow to the left of a device in the project tree.

   The elements arranged below the device are displayed.
2. Double-click on "Text lists".

   All the text lists assigned to the device are displayed in the work area listed in a table.
3. Double-click on the first free row in the table.

   A new user-defined text list is created.
4. Enter a name for your new text list in the "Name" column.
5. From the drop-down list in the "Selection" column, select whether you want to specify the value ranges in decimal, binary or in bits. Depending on the device, there may be further options available at this point.
6. Enter a comment in the "Comment" column.

   A new user-defined text list has been created and you can now enter the value ranges and texts.

7.6.3 Editing user-defined text lists

Editing user-defined text lists

You can enter value ranges and the corresponding texts in user-defined text lists. User-defined text lists are always located below a device in the project tree.

Requirement

- You are in the project view.
- A project is open.
- The project includes a least one device.

Adding to user-defined text lists with value ranges and texts

To add to user-defined text lists with value ranges and texts, follow these steps:

1. Click on the arrow to the left of a device in the project tree.

   The elements arranged below are displayed.
2. Double-click on "Text lists".

   All the text lists assigned to the device are displayed in the work area listed in a table.
3. Select a text list in the table.

   The contents of the selected text list are displayed in the work area. There, you can enter a value range and assign texts to the individual value ranges.
4. Enter the value ranges you require in the "Range from" and " Range to" columns. The entry must be made in the numeric format selected for the text list.
5. Enter a text for each value range in the "Entry" column.

7.6.4 Editing system-defined text lists

Editing system-defined text lists

In system-defined text lists, you can only modify the individual texts assigned to a value range.

System-defined text lists are located in the project tree either below a device or under "Common data".

Requirement

- You are in the project view.
- A project is open.
- The project includes a least one device.

Modifying texts in system-defined text lists

To edit texts in system-defined text lists that are assigned to a value range, follow these steps:

1. Click on the arrow to the left of a device in the project tree or the "Common data" element.

   The elements arranged below are displayed.

2. Double-click on "Text lists".

   All the text lists assigned to the device or used in common are displayed in the work area listed in a table.

3. Select a text list in the table.

   The contents of the selected text list are displayed in the work area. Here, you can add to or edit the texts assigned to a value range.

4. Enter a text for each value range in the "Entry" column.

7.7 Using memory cards

7.7.1 Basics about memory cards

Introduction

Memory cards are plug-in cards that come in a variety of types and can be used for a variety of purposes. Depending on the device type or device family, memory cards can be used for purposes, such as:

- Load memory of a CPU
- Storage medium for projects, firmware backups, or any other files
- Storage medium for performing a firmware update
- Storage medium for the PROFINET device name

For information regarding the technical variants of the respective memory cards and general information on their handling, refer to the respective documentation for the device. For information on handling memory cards in the TIA Portal, refer to the online help under keyword "Memory Card".

CAUTION
Do not use memory cards for non-SIMATIC-related purposes, and do not use third-party devices or Windows tools to format them. This will irrevocably overwrite the internal structure of the memory card, rendering it unusable for SIMATIC devices!

See also

Adding a user-defined card reader (Page 269)

Accessing memory cards (Page 270)

Displaying properties of memory cards (Page 271)

7.7.2 Adding a user-defined card reader

Introduction

If your card reader is not detected automatically, you can add it manually.

Requirement

The project view is open.

Procedure

To add a card reader, follow these steps:

1. Open the project tree.
2. Select "SIMATIC Card Reader > Add user-defined Card Reader" in the "Project" menu.

   The "Add user-defined Card Reader" dialog opens.
3. In the drop-down list box, select the path for the card reader.
4. Confirm your entries with "OK".

See also

Basics about memory cards (Page 269)

Accessing memory cards (Page 270)

Displaying properties of memory cards (Page 271)

7.7.3 Accessing memory cards

Requirement

- A memory card is inserted in the card reader.
- The project view is open.

Procedure

To access memory cards, follow these steps:

1. Open the project tree.
2. Select "SIMATIC Card Reader > Show SIMATIC Card Reader" in the "Project" menu.

   The "SIMATIC Card Reader" folder is displayed in the project tree.
3. Open the "SIMATIC Card Reader" folder.

   You can now access the memory card.

See also

Basics about memory cards (Page 269)

Adding a user-defined card reader (Page 269)

Displaying properties of memory cards (Page 271)

7.7.4 Displaying properties of memory cards

You can display the properties for the utilized memory cards. Note that different memory cards with different properties must be used, depending on the device.

Requirement

- A memory card is inserted in the card reader.
- The project view is open.

Procedure

To display the properties of a memory card, follow these steps:

1. Right-click on the memory card for which you want to display the properties.
2. Select the "Properties" command in the shortcut menu.

   The "Memory Card <name of the memory card>" dialog opens. The properties are displayed in this dialog.

Basics about memory cards (Page 269)

Adding a user-defined card reader (Page 269)

Accessing memory cards (Page 270)

7.8 Using libraries

7.8.1 Library basics

Introduction

You can store objects you want to use more than once in libraries. It is possible to reuse the stored objects throughout a project or across projects. This means you can, for example, create block templates for use in different projects and adapt them to the particular requirements of your automation task.

Library types

Depending on the task, you can use one of the following library types:

- Project library

  Each project has its own library. Here, you store the objects you want to use more than once in the project. This project library is always opened, saved, and closed together with the current project.

- Global libraries

  You can also create other libraries in addition to the project library. Here, you store the objects you want to use in more than one project. You can create, change, save, and transfer these global libraries independent of projects.

  In the global libraries area, you will also find libraries that ship with the software. These include off-the-peg functions and function blocks that you can use within your project. You cannot modify the supplied libraries.

Library objects

Libraries can accommodate a large number of objects. These include, for example:

- Functions (FCs)
- Function blocks (FBs)
- Data blocks (DBs)
- Devices
- PLC data types
- Watch and force tables
- Process screens
- Faceplates

For objects with know-how protection, this protection is also retained after the object is inserted into a library.

Use types

You can use the library elements as either a copy template or a type. You can use copy templates to generate copies of the library element that are independent of one another. Copy templates are marked with a black triangle in the "Libraries" task card. You can derive and use instances from types. These instances are tied to their respective type, and changes to one instance also change all other instances. Types are marked with a green triangle in the "Libraries" task card.

Note

Please note the following:

- The use as a type is not available for every object.
- You can only create types in the project library.

See also

Project library basics (Page 276)

Global library basics (Page 285)

"Libraries" task card (Page 273)

7.8.2 "Libraries" task card

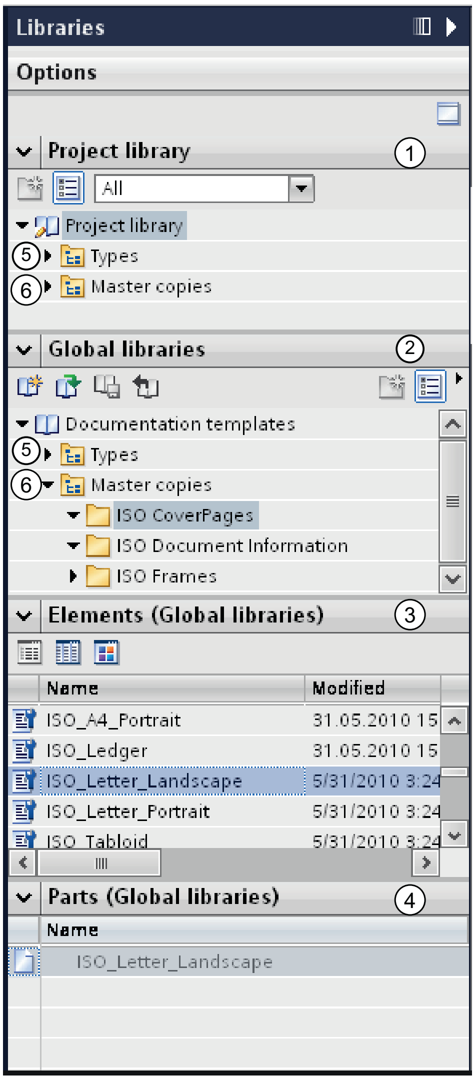
Function of the "Libraries" task card

The "Libraries" task card enables you to work efficiently with the project library and the global libraries.

You can show or hide the task card as needed.

Structure of the "Libraries" task card

The "Libraries" task card consists of the following components:



Name	Modified
ISO_A4_Portrait	31.05.2010 15
ISO_Ledger	31.05.2010 15
ISO_Letter_Landscape	5/31/2010 3:24
ISO_Letter_Portrait	5/31/2010 3:24
ISO_Tabloid	5/31/2010 3:24

① "Project library" pane

② "Global libraries" pane

③ "Elements" pane

④ "Parts" pane

⑤ "Types" folder

⑥ "Master copies" folder

"Project library" pane

In this pane, you can store the objects that you want to use more than once in the project.

"Global libraries" pane

In this pane, you can store the objects you want to use more than once in various projects.

The "Global libraries" pane also lists libraries that ship with the system. These libraries provide you with ready-made functions and function blocks, for example. You can use these supplied global libraries but cannot modify them.

"Elements" pane

In this pane, you can display the elements of a library.

"Parts" pane

In this pane, you can display the contents of the library elements.

"Types" folder

In this directory, you can create types of your objects in the project library and insert them as instances. You cannot create types in a global library. You can copy a type in the project library and paste it into the "Types" folder of a global library.

"Master copies" folder

In this directory, you can create copy templates of your objects, which you can insert as copies.

See also

Library basics (Page 272)

Using the elements and parts view (Page 276)

7.8.3 Using the elements and parts view

Introduction

When you open the "Libraries" task card the first time, the "Project library" and "Global libraries" panes are opened and the "Parts" pane is closed. You need to open the "Elements" pane explicitly.

The elements view shows the elements of the selected library. You can select one of the following views:

- Details
- List
- Overview

The parts view shows the contents of the selected library element.

Requirement

The "Libraries" task card is displayed.

Procedure

To use the elements and parts view, follow these steps:

1. Click "Open or close the element view" in the "Project library" or "Global libraries" pane.

See also

Library basics (Page 272)

"Libraries" task card (Page 273)

7.8.4 Working with the project library

7.8.4.1 Project library basics

Function

In the project library, you can store the elements that you want to use more than once in the project. The project library is generated and saved automatically with the project.

See also

Library basics (Page 272)

7.8.4.2 Creating folders in the project library

The library elements are stored according to their type in the "Types" and "Master copies" folders within the project library. You can add subfolders to these folders as required.

Requirement

The "Libraries" task card is displayed.

Procedure

To create a new folder, follow these steps:

1. Right-click any folder within the project library.
2. Select "Add folder" from the shortcut menu.

   A new folder is created.
3. Enter a name for the new folder.

See also

Project library basics (Page 276)

Editing elements of a project library (Page 282)

Removing elements from the project library (Page 284)

Filtering the view (Page 285)

7.8.4.3 Adding elements to the project library

Adding master copies to the project library

Requirement

The "Libraries" task card is displayed.

Procedure

To add a new copy template to the project library, follow these steps:

1. Open the project library in the "Project library" pane of the "Libraries" task card.
2. Select the element you want to add as a copy template to the project library, and use a drag-and-drop operation to move it to the "Master copies" folder or any of its subfolders in the project library. Release the left mouse button when a small plus symbol appears below the mouse pointer.

Result

The element is inserted into the project library as a copy template. You can generate copies from this template and use them anywhere in the TIA Portal where it is permissible.

See also

Library basics (Page 272)

Project library basics (Page 276)

Adding types to the project library (Page 278)

Adding types to the project library

Requirement

- Your installed products contain objects from which types can be generated.
- The "Libraries" task card is displayed.

Procedure

To add a new type to the project library, follow these steps:

1. Open the project library in the "Project library" pane of the "Libraries" task card.
2. Right-click the "Types" folder or any of its subfolders.
3. Select the "Add new type" command in the shortcut menu.

   The dialog for generating types opens.

   Note

   If your installed products do not contain any objects from which types can be generated, the "Add new type" command is not available. Use master copies in this case.

4. In the dialog, choose the element from which you want to generate a type.
5. Specify all other necessary data.
6. Click "OK".

Result

A new type is generated and inserted into the project library. You can generate instances from this type and use them anywhere in the TIA Portal where it is permissible. The instances are tied to the type, i.e., changes to one instance are passed on to the other instances.

See also

Library basics (Page 272)

Project library basics (Page 276)

Adding master copies to the project library (Page 277)

7.8.4.4 Using elements of the project library

Using master copies

You use the master copies you inserted into the project library in order to generate copies of elements and insert them in the TIA Portal, where permitted. The copies are generated and used in a single operation.

Requirement

The "Libraries" task card is displayed.

Procedure

To generate and use a copy from a copy template, follow these steps:

1. Open the "Master copies" folder or any of its subfolders in the project library so that you looking at the master copy from which you want to generate a copy.
2. Use a drag-and-drop operation to move the copy template from the project library to the location where you want to use it. If you are not permitted to insert it at this location, the mouse pointer changes to a circle with a slash.

   A copy based on the copy template is inserted. If there is already an element with the same name at this location, the "Paste" dialog opens. In this dialog, you can decide whether to replace the existing element or to insert the copy with a different name.

   Note

   The "Paste" dialog is not displayed for all elements. The elements for which the dialog is available depends on the installed products.

Or:

1. Open the element view.
2. Use a drag-and-drop operation to move the copy template from the "Elements" pane to the location where you want to use it. If you are not permitted to insert it at this location, the mouse pointer changes to a circle with a slash.

   A copy based on the copy template is inserted. If there is already an element with the same name at this location, the "Paste" dialog opens. In this dialog, you can decide whether to replace the existing element or to insert the copy with a different name.

   Note

   The "Paste" dialog is not displayed for all elements. The elements for which the dialog is available depends on the installed products.

Result

A copy is generated from the copy template and inserted at the location where you want to use it. You can create any number of copies from a copy template.

Library basics (Page 272)

Project library basics (Page 276)

Using types (Page 281)

Using the elements and parts view (Page 276)

Using types

You use the types you inserted into the project library in order to generate instances of elements and insert them in the TIA Portal, where permissible. The instances are generated and used in a single operation.

Requirement

The "Libraries" task card is displayed.

Procedure

To generate and use an instance from a type, follow these steps:

1. Open the "Types" folder or any of its subfolders in the project library so that you looking at the type from which you want to generate an instance.
2. Use a drag-and-drop operation to move the type from the project library to the location where you want to use it. If you are not permitted to insert it at this location, the mouse pointer changes to a circle with a slash.

   The type is inserted as an instance. If there is already an element with the same name at this location, the "Paste" dialog opens. In this dialog, you can decide whether to replace the existing element or to insert the instance with a different name.

   ### Note

   The "Paste" dialog is not displayed for all elements. The elements for which the dialog is available depends on the installed products.

Or:

1. Open the element view.
2. Use a drag-and-drop operation to move the type from the "Elements" pane to the location where you want to use it. If you are not permitted to insert it at this location, the mouse pointer changes to a circle with a slash.

   The type is inserted as an instance. If there is already an element with the same name at this location, the "Paste" dialog opens. In this dialog, you can decide whether to replace the existing element or to insert the instance with a different name.

   ### Note

   The "Paste" dialog is not displayed for all elements. The elements for which the dialog is available depends on the installed products.

Result

An instance is generated from the type and inserted at the location where you want to use it. You can create any number of instances from a type. The instances are tied to the type, i.e., changes to one instance are passed on to the other instances.

Library basics (Page 272)

Project library basics (Page 276)

Using master copies (Page 279)

7.8.4.5 Editing elements of a project library

You can use the following editing commands on library elements:

- Copy
- Cut
- Paste
- Move within the library
- Rename

Each of these commands can always be executed via the keyboard (Page 194), menu, and shortcut menu.

Requirement

The "Libraries" task card is displayed.

Copying elements

To copy a library element, follow these steps:

1. Right-click on the library element you want to copy.
2. Select the "Copy" command in the shortcut menu.

Cutting elements

To cut a library element, follow these steps:

1. Right-click on the library element you want to cut.
2. Select the "Cut" command in the shortcut menu.

Note

You can only paste previously cut library elements into the same library. In so doing, you can only paste master copies into the "Master copies" folder or any of its subfolders. Likewise, you can only paste types into the "Types" folder or any of its subfolders.

Pasting elements

To paste a library element, follow these steps:

1. Copy a library element.
2. Right-click the library where you want to paste the element.
3. Select the "Paste" command in the shortcut menu.

Moving elements

To move a library element, follow these steps:

1. Select the library element you want to move.
2. Use a drag-and-drop operation to move the library element to the folder where you want to insert the element.

Note

Note the following:

- When you move an element from one library to another, the element is copied and not moved.
- You cannot move master copies into a type folder or a type into a master copies folder.

Renaming elements

To rename a library element, follow these steps:

1. Right-click the element you want to rename.
2. Select the "Rename" command in the shortcut menu.
3. Enter the new name.

Creating folders in the project library (Page 277)

Removing elements from the project library (Page 284)

Filtering the view (Page 285)

7.8.4.6 Removing elements from the project library

Requirements

The "Libraries" task card is displayed.

Procedure

To remove an element from the project library, follow these steps:

1. In the "Project library" pane, maximize the folder containing the element you want to remove.
2. Right-click the element.
3. Select the "Delete" command in the shortcut menu.

Or:

1. Open the element view.
2. Right-click the element you want to remove in the "Elements" pane.
3. Select the "Delete" command in the shortcut menu.

See also

Editing elements of a project library (Page 282)

Filtering the view (Page 285)

7.8.4.7 Filtering the view

To make viewing of extensive libraries more straightforward, you can use filter options to limit the display.

Requirement

The "Libraries" task card is displayed.

Procedure

To filter the view, follow these steps:

1. Open either the "Project library" pane or "Global libraries" pane.
2. In the drop-down list, select the object type for which you want to display the library elements.

Result

Only the library elements that are available for the object type are displayed. You can set the filter to "All" at any time to revert to an unfiltered view.

Editing elements of a project library (Page 282)

Removing elements from the project library (Page 284)

7.8.5 Working with global libraries

7.8.5.1 Global library basics

Function

You can store elements that you want to reuse in other projects in global libraries. You must create global libraries explicitly.

Depending on the products installed, global libraries supplied by Siemens are also installed. You can use, but not change, the elements of these libraries.

Shared work with global libraries

You can use global libraries together with other users. This requires, however, that all users who want to access to the global library open the library as read-only.

See also

Library basics (Page 272)

7.8.5.2 Creating a new global library

Requirement

The "Libraries" task card is displayed.

Procedure

To create a new global library, follow these steps:

1. Click "Create new global library" in the toolbar of the "Global libraries" pane or select the menu command "Options > Global libraries > Create new library".

   The "Create new global library" dialog opens.
2. Specify the name and the storage location for the new global library.
3. Confirm your entries with "Create".

Result

The new global library is generated and inserted into the "Global libraries" pane. A folder with the name of the global library is created in the file system at the storage location of the global library. This actual library file is given the file name extension ".al11".

Using a supplied global library (Page 301)

Filtering the view (Page 302)

7.8.5.3 Opening a global library

Requirement

The "Libraries" task card is displayed.

Procedure

To open a global library, follow these steps:

1. Click "Open global library" in the toolbar of the "Global libraries" pane or select the menu command "Options > Global libraries > Open library".

   The "Open global library" dialog box is displayed.
2. Select the global library you want to open. Library files are identified by the file name extension ".al11".
3. You can also open the library so that it is write-protected. To do this, enable the "Open as read-only" option in the "Open global library" dialog.

   Note

   Note the following:

   - You cannot enter any additional elements in the global library if you open the library as read-only.
   - All users have to open the library as read-only if multiple users want to access the library. This is a requirement for shared access to the library.
4. Click "Open".

   The selected global library is opened and inserted into the "Global libraries" pane.

Using a supplied global library (Page 301)

Filtering the view (Page 302)

7.8.5.4 Displaying properties of global libraries

You can display the properties of global libraries. Properties include the following:

- General information about the library

  This includes the following information: creation time, author, file path, file size, copyright, etc. Many of the attributes can be changed.
- Library history

  The library history contains an overview of the migrations performed. Here you can also call the log file for the migrations.
- Support packages in the library

  You can display an overview of the additional software needed to work with all devices in the project.
- Software products in the library

  You can display an overview of all installed software products needed for the project.

Requirement

The "Libraries" task card is displayed.

Procedure

To display the properties of a global library, follow these steps:

1. Right-click the global library whose properties you want to display.
2. Select the "Properties" command in the shortcut menu.

   A dialog containing the properties of the global libraries opens.
3. Select the properties in the area navigation that you want to have displayed.

Filtering the view (Page 302)

7.8.5.5 Saving a global library

You can save changes made to global libraries not supplied by Siemens at any time. You can save a global library under another name using the "Save library as" command.

Requirement

- The "Libraries" task card is displayed.
- The global library is not write protected.

Saving changes

To save a global library, follow these steps:

1. Right-click on the global library you want to save.
2. Select the "Save library" command in the shortcut menu.

Saving a global library under another name

To save a global library under another name, follow these steps:

1. Right-click the global library that you want to save under a different name.
2. Select the "Save library as" command in the shortcut menu.

   The "Save global library as" dialog opens.
3. Select the storage location and enter the file name.
4. Confirm your entries with "Save".

   The library is saved in the specified location under the new name. The original library is retained.

7.8.5.6 Closing a global library

Global libraries are independent of projects. This means that they are not closed together with your project. You must therefore close global libraries explicitly.

Requirement

The "Libraries" task card is displayed.

Procedure

To close a global library, follow these steps:

1. Right-click on the global library you want to close.
2. Select the "Close library" command in the shortcut menu.
3. If you make changes to the global library, a dialog box opens where you can choose whether you want to save the changes to the global library. Click "Yes" or "No", depending on whether or not you would like to save your changes.

   The global library is closed.

7.8.5.7 Deleting a global library

You can delete global libraries that were not supplied by Siemens. Note, however, that this action causes deletion of the entire library directory in the file system of your programming device or PC.

Requirements

The "Libraries" task card is displayed.

Procedure

To delete a global library, follow these steps:

1. Right-click the global library you want to delete.
2. Select the "Delete" command in the shortcut menu.
3. Click "Yes" to confirm.

Result

The global library is removed from the "Global libraries" pane and deleted from the file system.

Using a supplied global library (Page 301)

Filtering the view (Page 302)

7.8.5.8 Creating folders in the global libraries

The library elements are stored according to their type in the "Types" and "Master copies" folders within global libraries. You can add subfolders to these folders as required.

Requirements

- The "Libraries" task card is displayed.
- The global library is not write protected.

Procedure

To create a new folder, follow these steps:

1. Right-click any folder within the global library.
2. Select "Add folder" from the shortcut menu.

   A new folder is created.
3. Enter a name for the new folder.

7.8.5.9 Adding elements to a global library

Adding master copies to a global library

Requirements

- The "Libraries" task card is displayed.
- The global library is not write protected.

Procedure

To add a new copy template to a global library, follow these steps:

1. In the Global libraries" pane of the "Libraries" task card, open the global library to which you want to add the copy template.
2. Select the element you want to add as a master copy to the global library, and use a drag-and-drop operation to move it to the "Master copies" folder or any of its subfolders in the global library. Release the left mouse button when a small plus symbol appears below the mouse pointer.

Result

The element is inserted into the global library as a copy template. You can generate copies from this template and use them anywhere in the TIA Portal where it is permissible.

Adding types to a global library (Page 294)

Adding types to a global library

You can paste an existing type into a global library type from the project library. This allows you to use this type across multiple projects.

Requirement

- The "Libraries" task card is displayed.
- A type is available in the project library.

Procedure

To add a type to a global library, follow these steps:

1. Open the project library in the "Project library" pane of the "Libraries" task card.
2. Right-click the type which you want to paste into the global library.
3. In the shortcut menu, select "Copy".
4. Right-click the type which you want to paste into the global library.
5. In the shortcut menu, select "Paste".

Result

The type is inserted in the global library. You can generate instances from this type and use them anywhere in the TIA Portal where it is permissible. The instances are tied to the type, i.e., changes to one instance are passed on to the other instances.

7.8.5.10 Using elements of a global library

Using master copies

You use the master copies you inserted into the global library in order to generate copies of elements and insert them in the TIA Portal, where permitted. The copies are generated and used in a single operation.

Requirements

The "Libraries" task card is displayed.

Procedure

To generate and use a copy from a copy template, follow these steps:

1. Open the "Master copies" folder or any of its subfolders in the global library so that you looking at the master copy from which you want to generate a copy.
2. Use a drag-and-drop operation to move the copy template from the global library to the location where you want to use it. If you are not permitted to insert it at this location, the mouse pointer changes to a circle with a slash.

   A copy based on the copy template is inserted. If there is already an element with the same name at this location, the "Paste" dialog opens. In this dialog, you can decide whether to replace the existing element or to insert the copy with a different name.

   Note

   The "Paste" dialog is not displayed for all elements. The elements for which the dialog is available depends on the installed products.

Or:

1. Open the element view.
2. Use a drag-and-drop operation to move the copy template from the "Elements" pane or the "Parts" pane to the location where you want to use it. If you are not permitted to insert it at this location, the mouse pointer changes to a circle with a slash.

   A copy based on the copy template is inserted. If there is already an element with the same name at this location, the "Paste" dialog opens. In this dialog, you can decide whether to replace the existing element or to insert the copy with a different name.

   Note

   The "Paste" dialog is not displayed for all elements. The elements for which the dialog is available depends on the installed products.

Result

A copy is generated from the copy template and inserted at the location where you want to use it. You can create any number of copies from a copy template.

Using types (Page 296)

Using the elements and parts view (Page 276)

Using types

You use the types you inserted into a global library in order to generate instances of elements and insert them in the TIA Portal, where permissible. The instances are generated and used in a single operation.

Requirements

The "Libraries" task card is displayed.

Procedure

To generate and use an instance from a type, follow these steps:

1. Open the "Types" folder or any of its subfolders in the global library so that you looking at the type from which you want to generate an instance.
2. Use a drag-and-drop operation to move the type from the global library to the location where you want to use it. If you are not permitted to insert it at this location, the mouse pointer changes to a circle with a slash.

   The type is inserted as an instance. If there is already an element with the same name at this location, the "Paste" dialog opens. In this dialog, you can decide whether to replace the existing element or to insert the instance with a different name.

   Note

   The "Paste" dialog is not displayed for all elements. The elements for which the dialog is available depends on the installed products.

Or:

1. Open the element view.
2. Use a drag-and-drop operation to move the type from the "Elements" pane to the location where you want to use it. If you are not permitted to insert it at this location, the mouse pointer changes to a circle with a slash.

   The type is inserted as an instance. If there is already an element with the same name at this location, the "Paste" dialog opens. In this dialog, you can decide whether to replace the existing element or to insert the instance with a different name.

   Note

   The "Paste" dialog is not displayed for all elements. The elements for which the dialog is available depends on the installed products.

Result

An instance is generated from the type and inserted at the location where you want to use it. You can create any number of instances from a type. The instances are tied to the type, i.e., changes to one instance are passed on to the other instances.

7.8.5.11 Editing elements of a global library

You can use the following editing commands on library elements:

- Copy
- Cut
- Paste
- Move within the library
- Rename

Each of these commands can always be executed via the keyboard (Page 194), menu, and shortcut menu.

Requirements

- The "Libraries" task card is displayed.
- The global library is not write protected.

Copying elements

To copy a library element, follow these steps:

1. Right-click on the library element you want to copy.
2. Select the "Copy" command in the shortcut menu.

Cutting elements

To cut a library element, follow these steps:

1. Right-click on the library element you want to cut.
2. Select the "Cut" command in the shortcut menu.

Note

You can only paste previously cut library elements into the same library. In so doing, you can only paste master copies into the "Master copies" folder or any of its subfolders. Likewise, you can only paste types into the "Types" folder or any of its subfolders.

Pasting elements

To paste a library element, follow these steps:

1. Copy a library element.
2. Right-click the library where you want to paste the element.
3. Select the "Paste" command in the shortcut menu.

Moving elements

To move a library element within a library, follow these steps:

1. Select the library element you want to move.
2. Drag the library element to the library where you want to insert the element.

Note

When you move an element from one library to another, the element is copied and not moved.

Renaming elements

To rename a library element, follow these steps:

1. Right-click the element you want to rename.
2. Select the "Rename" command in the shortcut menu.
3. Enter the new name.

7.8.5.12 Removing elements from a global library

Requirements

- The "Libraries" task card is displayed.
- The global library is not write protected.

Procedure

To remove an element from a global library, follow these steps:

1. In the "Global libraries" pane, maximize the folder containing the element you want to remove.
2. Right-click the element.
3. Select the "Delete" command in the shortcut menu.

Or:

1. Open the element view.
2. Right-click the element you want to remove in the "Elements" pane.
3. Select the "Delete" command in the shortcut menu.

7.8.5.13 Using a supplied global library

Depending on the products you install, various global libraries ship with the system.

Requirement

The "Libraries" task card is displayed.

Procedure

To use an element from a supplied global library in your project, follow these steps:

1. Open the relevant library so that you can see the elements of the library.
2. Drag the element from the "Global libraries" pane and drop it on the location where you want to use it. If you are not permitted to insert it at this location, the mouse pointer changes to a circle with a slash.

Or:

1. Open the element view.
2. Use a drag-and-drop operation to move the element from the "Parts" pane to the location where you want to use it. If you are not permitted to insert it at this location, the mouse pointer changes to a circle with a slash.

7.8.5.14 Filtering the view

To make viewing of extensive libraries more straightforward, you can use filter options to limit the display.

Requirement

The "Libraries" task card is displayed.

Procedure

To filter the view, follow these steps:

1. Open either the "Project library" pane or "Global libraries" pane.
2. In the drop-down list, select the object type for which you want to display the library elements.

Result

Only the library elements that are available for the object type are displayed. You can set the filter to "All" at any time to revert to an unfiltered view.

7.9 Using cross-references

7.9.1 Using cross-references

Introduction to cross-references

The cross-reference list provides an overview of the use of objects within the project. You can see which objects are interdependent and where the individual objects are located. Cross-references are therefore part of the project documentation.

You can also jump directly to the point of use of an object.

Which objects you can display and localize in the cross-reference list depends on the installed products.

7.10 Simulating devices

7.10.1 Simulation of devices

Introduction

You can use the TIA Portal to run and test the hardware and software of the project in a simulated environment. The simulation is performed directly on the programming device or PC. No additional hardware is required.

The simulation software provides a graphical user interface for monitoring and changing the configuration. It differs according to the currently selected device.

Integration in the TIA Portal

The simulation software is fully integrated in the TIA Portal but is only supported by certain devices. Therefore, the button for calling the simulation software is only active if the selected device supports simulation.

The simulation software for some devices requires its own virtual interface to communicate with the simulated devices. The virtual interface can be found in the project tree under the "Online access" entry next to the physical interfaces of the programming device/PC.

Once you have opened the software, additional help on the simulation software is available via a separate link.

See also

Starting the simulation (Page 304)

7.10.2 Starting the simulation

Some devices can be simulated with additional software. You therefore do not have to have the actual devices to perform comprehensive testing of your project.

Procedure

To start the simulation software, follow these steps:

1. Select the device you want to simulate, for example, in the project tree.
2. Select the "Simulation > Start" command in the "Online" menu.

   This calls the simulation software.

Editing devices and networks 8

8.1 Configuring devices and networks

8.1.1 Hardware and network editor

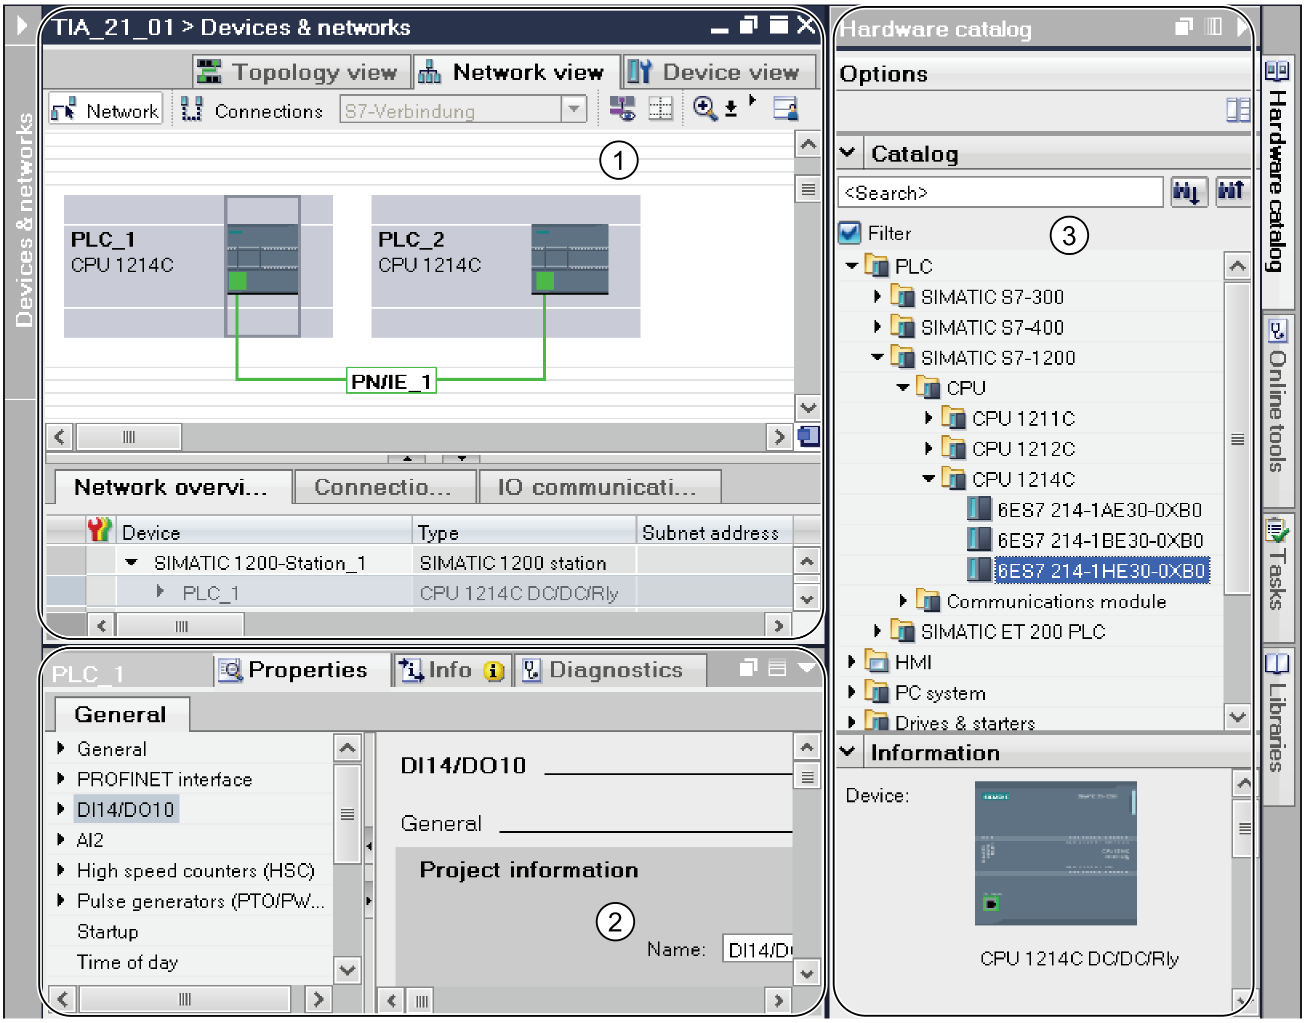
8.1.1.1 Overview of hardware and network editor

Function of the hardware and network editor

The hardware and network editor opens when you double-click on the "Devices and Networks" entry in the project tree. The hardware and network editor is the integrated development environment for configuring, networking and assigning parameters to devices and modules. It provides maximum support for the realization of the automation project.

Structure of the hardware and network editor

The hardware and network editor consists of the following components:



Device	Type	Subnet address
SIMATIC 1200-Station_1	SIMATIC 1200 station	
PLC_1	CPU 1214C DC/DC/Rly	

Name: DI14/Di

① Device view (Page 310), network view (Page 307), topology view (Page 313)

② Inspector window (Page 318)

③ Hardware catalog (Page 320)

The hardware and network editor provides you with three views of your project. You can switch between these three views at any time depending on whether you want to produce and edit individual devices and modules, entire networks and device configurations or the topological structure of your project.

The inspector window contains information on the object currently marked. Here you can change the settings for the object marked.

Drag the devices and modules you need for your automation system from the hardware catalog to the network, device ot topology view.

8.1.1.2 Network view

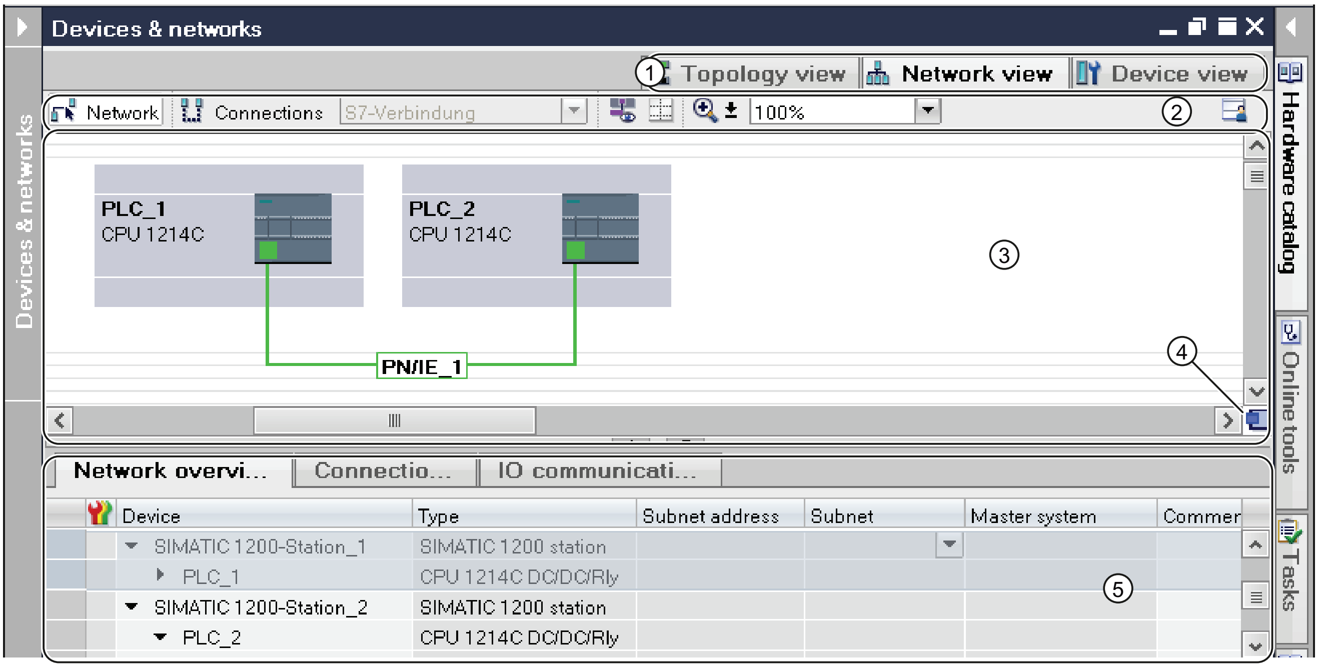
Introduction

The network view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Configuring and assign device parameters
- Networking devices with one another

Structure

The following diagram shows the components of the network view:



Device	Type	Subnet address	Subnet	Master system	Commer
SIMATIC 1200-Station_1	SIMATIC 1200 station				
PLC_1	CPU 1214C DC/DC/Rly				
SIMATIC 1200-Station_2	SIMATIC 1200 station				
PLC_2	CPU 1214C DC/DC/Rly				

① Changeover switch: device view / network view / topology view
② Toolbar of network view
③ Graphic area of network view
④ Overview navigation
⑤ Table area of network view

You can use your mouse to change the spacing between the graphic and table areas of the network view. To do this, click on the upper edge of the table view and expand or contract this by moving the mouse with the mouse button held down. You can use the two small arrow keys to minimize, maximize or select the latest table structure of the table view with just one click.

Toolbar

The toolbar provides the following functions:

Symbol	Meaning
	Mode to network devices.
	Mode to create connections. You can define the connection type using the drop-down list.
	Mode to create relations.
	Show interface addresses.
🔍±	Adjust the zoom setting. You can select the zoom setting or enter it directly in the drop-down list. You can also zoom in or zoom out the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
▦	Show page breaks Enables page break preview. Dotted lines will be displayed at the positions where the pages will break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the network view displays any network-related devices, networks, connections and relations. In this area, you add devices from the hardware catalog, connect them with each other via their interfaces and configure the communication settings.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

Table area

The table area of the network view includes various tables for the devices, connections and communication settings present:

- Network overview
- Connections
- I/O communication

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

Networking devices in the network view (Page 349)

Tabular network overview (Page 352)

8.1.1.3 Device view

Introduction

The device view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Configuring and assign device parameters
- Configuring and assign module parameters

Structure

The following diagram shows the components of the device view:

	Module	Slot	I address	Q address	Type	Order no.	Firmware
	RS232_2	102			CM 1241 (RS232)	6ES7 241-1AH30-0X...	V1.0
	RS232_1	101			CM 1241 (RS232)	6ES7 241-1AH30-0X...	V1.0
	▼ PLC_1	1			CPU 1214C DC/DC/Rly	6ES7 214-1HE30-0X...	V1.0
	DI14/DO10	1.1	0...1	0...1	DI14/DO10		
	AI2	1.2	64...67		AI2		

① Changeover switch: device view / network view / topology view

② Toolbar of device view

③ Graphic area of the device view

④ Overview navigation

⑤ Table area of device view

You can use your mouse to change the spacing between the graphic and table areas of the device view. To do this, click on the upper edge of the table view and expand or contract this by moving the mouse with the mouse button held down. You can use the two small arrow keys to minimize, maximize or select the latest table structure of the table view with just one click.

Toolbar

The toolbar provides the following functions:

Symbol	Meaning
	Switches to the network view. Note: The device view can switch between the existing devices using the drop-down list.
	Show the area of unplugged modules.
	Show module labels.
	Adjust the zoom setting. Select the zoom setting or enter it directly in the drop-down list. You can use the Zoom symbol to zoom in or out incrementally or to drag a frame around an area to be enlarged. With signal modules, you can recognize the address labels from a zoom level of 200% or higher.
	Show page breaks Enables page break preview. Dotted lines will be displayed at the positions where the pages will break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the device view displays hardware components and if necessary the associated modules that are assigned to each other via one or more racks. In the case of devices with racks, you have the option of installing additional hardware objects from the hardware catalog into the slots on the racks.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

Table area

The table area of the device view gives you an overview of the modules used and the most important technical and organizational data.

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

See also

Objects in the device view (Page 331)

Determination of online status and display using symbols (Page 649)

8.1.1.4 Topology view

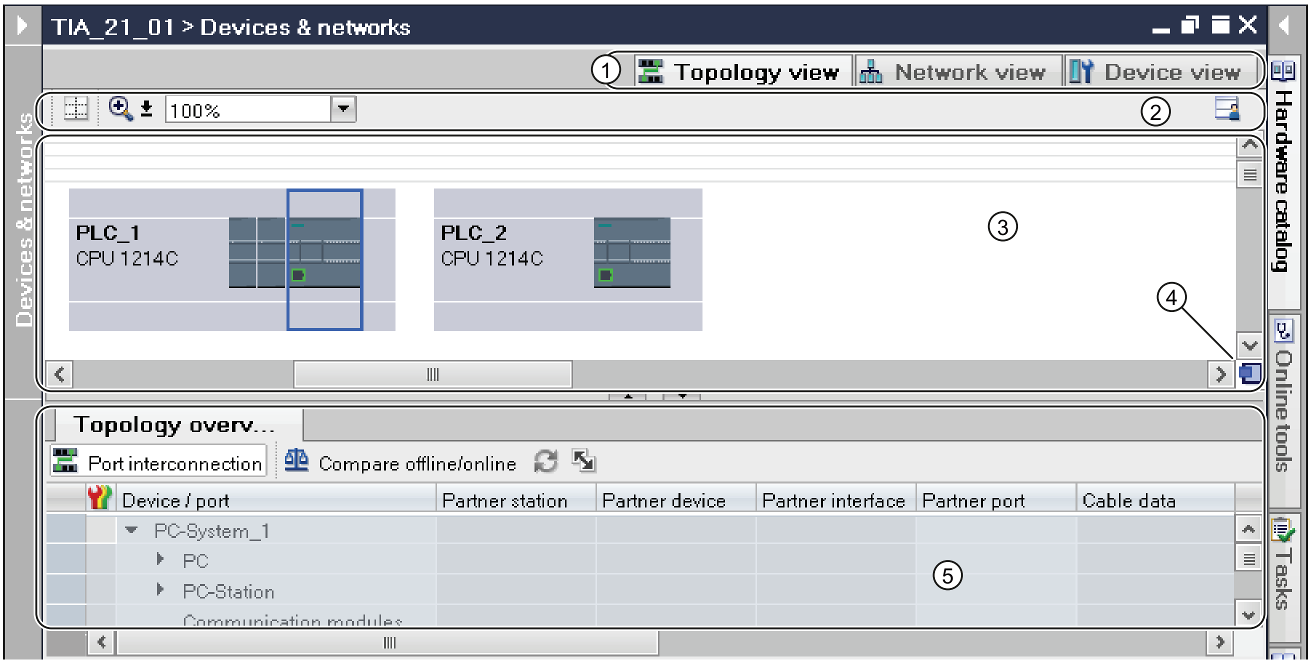
Introduction

The topology view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Displaying the Ethernet topology
- Configuring the Ethernet topology
- Identify and minimize differences between the desired and actual topology

Structure

The following figure provides an overview of the topology view.



① Changeover switch: device view / network view / topology view
② Topology view toolbar
③ Graphic area of the topology view
④ Overview navigation
⑤ Table area of the topology view

You can use your mouse to change the spacing between the graphic and table areas of the topology view. To do this, click on the upper edge of the table view and expand or contract this by moving the mouse with the mouse button held down. You can use the two small arrow keys to minimize, maximize or select the latest table structure of the table view with just one click.

Toolbar

The toolbar provides the following functions:

Symbol	Meaning
🔍 ±	Adjusting the zoom setting. You can select the zoom setting via the drop-down list or enter it directly. You can also zoom in or zoom out the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
⊞	Show page breaks Enables page break preview. Dotted lines will be displayed at the positions where the pages will break when printed.
▤	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the topology view displays Ethernet modules with their appropriate ports and port connections. Here you can add additional hardware objects with Ethernet interfaces. See: Adding a device to the hardware configuration (Page 336)

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

Table area

This displays the Ethernet or PROFINET modules with their appropriate ports and port connections in a table. This table corresponds to the network overview table in the network view.

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

See also

Determination of online status and display using symbols (Page 649)

8.1.1.5 Printing hardware and network configurations

Printout of hardware and network configurations

You can print out the following elements of the hardware and network view as part of the project documentation:

- Graphic network view
- Network overview table
- Graphic device view
- The device overview table
- The parameters of the object currently selected in the editor

Printout of editor content

If you start a printout within an opened editor and no module is selected, the content of the editor is always printed. This includes a graphic representation of the editor as well as the table for the editor. You can adapt the scope of the printout. You can specify whether only the graphic view, the table or both together are to be printed. Read section "Changing the print options (Page 317)" for more on this.

If the graphic is larger than the page layout you have selected, the printout is continued on the next page. No content is lost this way. Alternatively, you can change the zoom level of the graphic representation to fit the printout on one page. The printout is always made in the currently selected zoom setting.

To check that all content fits on one page, you can either use the print preview or activate the page break preview. When page break preview is activated, dashed lines are displayed within the graphic editor at the location where the page break is later made.

Printing very large tables

If a table is larger than the print area and therefore cannot be fully printed, the content of the table is not printed as a table, but instead as pairs between value and key.

Example:

Object name	Property 1	Property 2
Object A	Value A1	Value A2
Object B	Value B1	Value B2

In this case, the printout has the following appearance:

Object A

Property 1: Value A1

Property 2: Value A2

Object B

Property 1: Value B1

Property 2: Value B2

You can also preset this as a template so that tables are always printed as pairs between the key and the value. Read section "Auto-Hotspot" for more on this.

Printing module parameters

Parameters of selected modules are printed out along with the current value settings in text form. All parameters from corresponding modules are also printed. For example, if you have selected a CPU, the parameters of an inserted signal board, if present, are printed as well.

You can determine the scope of the module parameters to be printed. In the "Print" dialog, select whether all properties and parameters of a module are to be printed or whether to use the compact printout. If you select the compact form, only the entries in the "General" area of the module properties are printed. Comments on modules, as well as the author and module description, are excluded. In compact mode, the following module parameters are therefore printed, for example:

- Module specifications

  Name, module slot, short description, order number, firmware version
- Name of the PROFINET interface
- Subnet specifications

  Name of the subnet, ID of the S7 subnet

See also

Changing the print options (Page 317)

Activating the page break preview for printout (Page 317)

8.1.1.6 Activating the page break preview for printout

You can activate the page break preview for the printout in the graphic editor. If this option is activated, dashed lines are shown within the graphic editor at the locations where page breaks are later made during printout.

Procedure

Proceed as follows to activate the page break preview:

1. Select the graphic area of the corresponding view.
2. Click on the "Show page break" symbol in the toolbar of the graphic editor.

   Dashed lines are displayed within the graphic editor at the location a page break is later made.
3. To modify the frame layout, select the "Print" command in the "Project" menu.
4. To disable page break preview, click again on the "Show page break" symbol in the toolbar of the graphic editor.

8.1.1.7 Changing the print options

Changing the scope of the printout

When printing from an editor, you can specify whether both graphics and tables are to be printed or just one of the two. Both are printed by default.

Procedure

To change the scope of the printout, proceed as follows:

1. In the "Options" menu, select the "Settings" command.
2. In the area navigation, open the "Print settings" parameter group under "General".
3. Scroll to the "Hardware configuration" group.
4. Select or clear the "Active graphic view" check box, depending on whether you want to print the graphics of the network and device view as well.
5. Select or clear the "Active table" check box, depending on whether you want to print the table for the editor as well.

See also

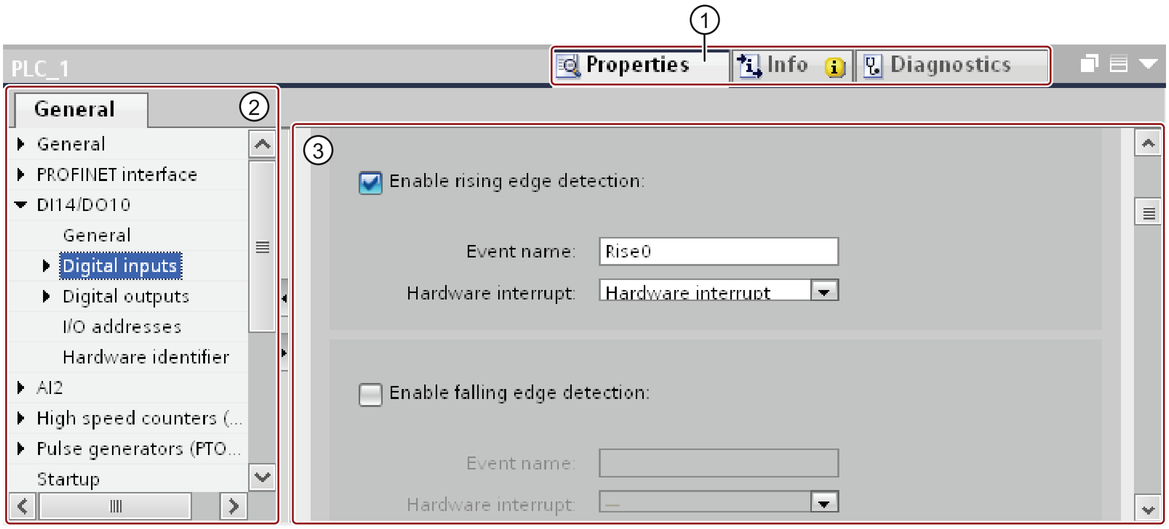
Printing hardware and network configurations (Page 315)

8.1.1.8 Inspector window

The properties and parameters shown for the object selected can be edited in the inspector window.

Structure

The inspector window consists of the following components:



☑ Enable rising edge detection:

Event name: Rise0

Hardware interrupt: Hardware interrupt

□ Enable falling edge detection:

Event name:

Hardware interrupt: ---

① Switch between various information and work areas

② Navigation between various pieces of information and parameters

③ Display showing the selected information and parameters

Function

The information and parameters in the inspector window are split into different types of information:

- Properties
- Info
- Diagnostics

To display the corresponding information and parameters, click in the area you want. The "Properties" area is the most important one for configuring an automation system. This area is displayed by default.

The left pane of the inspector window is used for area navigation. Information and parameters are arranged there in groups. If you click on the arrow symbol to the left of the group name, you can expand the group if sub-groups are available. If you select a group or sub-group, the corresponding information and parameters are displayed in the right pane of the inspector window and can be edited there too.

See also

Editing properties and parameters (Page 345)

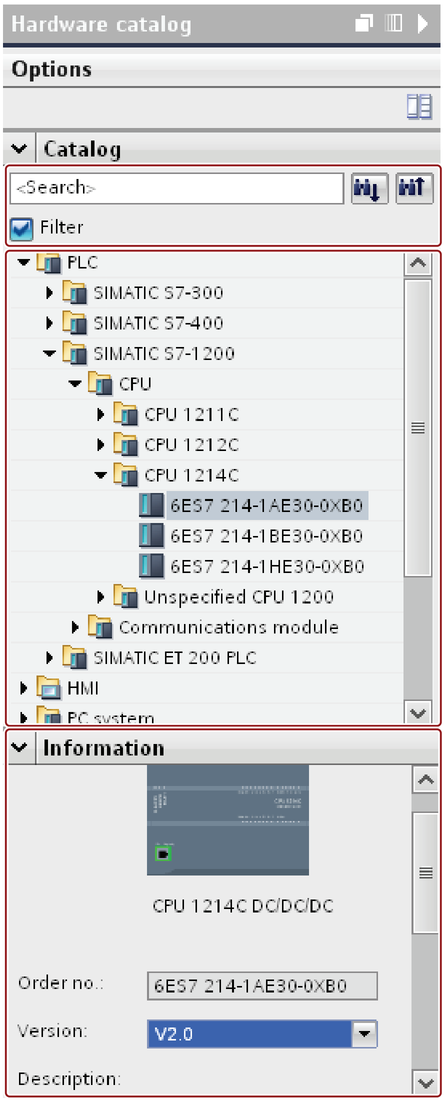
Overview of hardware and network editor (Page 305)

8.1.1.9 Hardware catalog

The "Hardware catalog" task card gives you easy access to a wide range of hardware components.

Structure

The "Hardware catalog" task card consists of the following panes:



Hardware catalog

Options

Catalog

<Search>

☑ Filter

- PLC
  - SIMATIC S7-300
  - SIMATIC S7-400
  - SIMATIC S7-1200
    - CPU
      - CPU 1211C
      - CPU 1212C
      - CPU 1214C
        - 6ES7 214-1AE30-0XB0
        - 6ES7 214-1BE30-0XB0
        - 6ES7 214-1HE30-0XB0
      - Unspecified CPU 1200
    - Communications module
  - SIMATIC ET 200 PLC
- HMI
- PC system

Information

CPU 1214C DC/DC/DC

Order no.: 6ES7 214-1AE30-0XB0

Version: V2.0

Description:

① "Catalog" pane, search and filter function
② "Catalog" pane, component selection
③ "Information" pane

Search and filter function

The search and filter functions of the "Catalog" pane make it easy to search for particular hardware components. You can limit the display of the hardware components to certain criteria using the filter function. For example, you can limit the display to objects that you can also place within the current context or which contain certain functions.

Objects that can be used in the current context include, for example, interconnectable objects in the network view or only modules compatible with the device in the device view.

Component selection

The component selection in the "Catalog" pane contains the installed hardware components in a tree structure. You can move the devices or modules you want from the catalog to the graphic work area of the device or network view.

Installed hardware components without a license are grayed out. You cannot use non-licensed hardware components.

Hardware components belonging to various components groups thematically are partially implemented as linked objects. When you click on such linked hardware components, a catalog tree opens in which you can find the appropriate hardware components.

Information

The "Information" pane contains detailed information on the object selected from the catalog:

- Schematic representation
- Name
- Version number
- Order number
- Brief description

Information on hardware components (Page 322)

8.1.1.10 Information on hardware components

In the hardware catalog, you can display information on selected hardware components in the "Information" pane. You can also display further information on the selected hardware components using the shortcut menu.

Access to further information

If you select a hardware object in the hardware catalog and open the shortcut menu, you not only have the "Copy" function available but also three options for accessing information on Service & Support:

- Information regarding product support
- FAQs
- Manuals

The required information is displayed in the work area of the hardware and network editor.

Note

You can only access Service & Support when you are connected to the Internet and the function is enabled. By default, the function is disabled. To enable the function, refer to the instructions in the section "Enabling product support (Page 323)".

Information regarding product support

Here, you have access to general information on hardware and software components. The order number of the selected hardware object is entered automatically in the search mask. You can, however, also search for other hardware and software components.

FAQs

Here, you have access to "Frequently Asked Questions" (FAQs). You can view various entries on hardware and software questions. Using a detailed search mask, you can filter the required topics.

Manuals

Here, you have access to the manuals of the various hardware components. This is particularly useful if the configuration, addressing or parameter assignment you are planning requires more detailed knowledge of the hardware you are using.

Hardware catalog (Page 320)

Enabling product support (Page 323)

8.1.1.11 Enabling product support

Enabling Service & Support function

For each device in the hardware catalog, you have the option of displaying additional information that is stored in the Service & Support area of the Siemens website. By default, the function is disabled. Instructions for enabling the function are given below.

Requirement

The software must have access to the Internet.

Procedure

To enable the Service & Support function, proceed as follows:

1. In the "Options" menu, select the "Settings" command.
2. Open the "Hardware configuration" group in the area navigation.
3. Select the "Via Internet" check box.

Result

You can now access product support, FAQs and manuals from the hardware catalog via the shortcut menu for the module.

Information on hardware components (Page 322)

8.1.1.12 Keyboard action in the hardware and network editor

You can execute some of the functions of the network and device view directly with a combination of keyboard and mouse in the hardware and network editor. The keyboard operation in tables corresponds to standard behavior. Here you find the keyboard operation for the graphic work area of the network and device view.

General keyboard operation

Function	Key combination	Comments
Zoom in on view in frame	<Ctrl+Space> + mouse button pressed	No object selection
Move view	<Space> + mouse button pressed	-
Cancel current operation	<Esc>	-
Separate connection	<Esc> or double-click	When making a connection
Zoom in graphic view	<Ctrl> + turn mouse wheel	-

Selected objects

Function	Key combination	Comments
Select object	Mouse click	-
Move object	<Ctrl+X>, then <Ctrl+V>	Copy selected object to move and then paste in new position
Copy object	<Ctrl+C>	Copy selected object to clipboard
Paste object	<Ctrl+V>	Paste object from clipboard to selection
Delete selected object	<Del>	-
Select several objects 1	<Shift> + click	Select objects individually
Select several objects 2	<Ctrl> + click	Selected objects can also be deselected
Move selection	Mouse button pressed	Move to permitted slot
Copy selection	<Ctrl> + mouse button pressed	Move to permitted slot

8.1.2 Configuring devices

8.1.2.1 Basics

Introduction to configuring hardware

To set up an automation system, you will need to configure, assign parameters and interlink the individual hardware components. The work needed for this is undertaken in the device and network view.

Configuring

"Configuring" is understood to mean arranging, setting and networking devices and modules within the device or network view. Racks are represented symbolically. Just like "real" racks, they allow you to plug in a defined number of modules.

An address is automatically assigned to each module. The addresses can be subsequently modified.

When the automation system is started, the CPU compares the setpoint configuration produced by the software with the system's actual configuration. Possible errors can be detected and reported straight away.

Assigning parameters

"Assigning parameters" is understood to mean setting the properties of the components used. Hardware components and settings for the exchange of data are assigned:

- Properties of modules with selectable parameters
- Settings for data exchange between components

The parameters are loaded into the CPU and transferred to the corresponding modules when the CPU starts up. Modules can be replaced with ease since the parameters set are automatically loaded into the new module during startup.

Adjusting the hardware to the project requirements

You need to configure hardware if you want to set up, expand or change an automation project. To do this, add hardware components to your structure, link these with existing components, and adapt the hardware properties to the tasks.

The properties of the automation systems and modules are preset such that in many cases they do not have to be parameterized again. Parameter assignment is however needed in the following cases:

- You want to change the default parameter settings of a module.
- You want to use special functions.
- You want to configure communication connections.

See also

Changing properties of the modules (Page 546)

Using existing configurations

Open existing projects

When opening existing projects, an automatic check is made to determine if the appropriate software is installed for all modules used within the project. If you try to open a project with modules that are not supported by the current scope of the installation of the TIA portal, a message appears on opening the project informing you of the missing software components. If the software components are not absolutely required to open the project, the project can still be opened.

Reaction to missing software components

Projects that contain modules not supported by the current scope of the installation react as follows:

- Display the modules on the GUI
  - The non-supported modules are displayed in the project navigation with all of their nested objects. However, the modules themselves cannot be processed in editors or in inspector windows. When possible, a replacement module is used that best matches the original module. Replacement modules are indicated by an exclamation mark.
  - Display of properties in tables is limited. This applies in particular to the display of network parameters, such as the IP address.
- Functional limitations
  - Non-supported modules cannot be printed out or compiled.
  - An online connection cannot be established to the module. It is therefore also impossible to download.
  - To change the device type, the device must first be deleted and then re-inserted. The "Change device type" function is not supported.
  - Copying and inserting nested objects, such as modules, is possible although the device itself cannot be copied and inserted.
  - The network configuration cannot be changed with replacement modules within the network view.
  - Cross-references can be displayed. However, the cross-references only reflect the state last saved within the project because on online comparison to the original module cannot be made.

General slot rules

Introduction

Specific slot rules apply to each automation system and module.

If you select a module from the hardware catalog in the device view, all possible slots for the module selected are marked in the rack. You can only drag modules to marked slots.

If you insert, move or swap a module, the slot rules are also applied.

Consistency

Some slot rules depend on how the environment is configured. This means that you can sometimes plug modules into the rack although this would result in inconsistencies at the current time. If you change the configuration, for example by selecting different modules or module parameter settings, you can make the configuration consistent again.

In cases where inserting a module results in an inconsistency that can be corrected, this will be permitted. A consistency check is run when transferring the configuration. Inconsistencies are displayed as alarms in the inspector window under "Info". You can revise your configuration on the basis of the results of the consistency check and make it consistent again.

Rules for arranging modules

As a rule of thumb, the following applies to modules in racks:

- You can only plug modules into a rack.
- You can only plug interface modules into a module.
- You can only use modules of the same product or system family in one rack.

There are also other special rules for some modules:

- Can only be inserted in certain slots
- Inertion depends on other modules, CPUs or settings
- Limitation of the number of times used in a rack

Browsing the hardware catalog

Introduction

Use the "Hardware catalog" task card to select the hardware components you want for a hardware configuration. Use the hardware catalog to select the interconnectable hardware components in the network and topology view and to select the modules you want in the device view.

Context filter

You can use the "Filter" option of the hardware catalog to restrict the number of displayed hardware components and the number of hardware components that can be found by searching.

If you select the filter, only those components are displayed that can be selected currently in the hardware catalog. If the do not select the filter, the entire hardware catalog is displayed.

If you switch between the various views, the view of the filter objects is adapted to the current context.

Search options

You can use the search function to search for specific entries in the hardware catalog. Note the following rules when entering search terms:

- No distinction is made between upper and lower case text.
- Dashes and blanks are ignored during the search.
- The search function considers parts of a search term.
- Several search terms must be separated by a space

You start the search from an object highlighted in the hardware catalog and either search upwards or downwards.

Symbol	Meaning
↓	Downwards search
↑	Upwards search

Browsing the hardware catalog

If you want to browse the hardware catalog, proceed as follows:

1. Click in the entry field of the search function
2. Enter a search term. The search includes the following elements:
   - Name of device or module
   - Order number (MLFB)
   - Description in "Information" pane
3. Click on either the "Downwards search" or "Upwards search" buttons.

Note

To ensure the right search direction, note which point you have marked in the hardware catalog. To browse the entire catalog, click on the topmost object of the hardware catalog and start the search once you have entered the search term by clicking "Downwards search".

The first match with the search term found is displayed as the result. For more search results, again click on the "Downwards search" or "Upwards search" button.

Observe the context filter of the hardware catalog. If this is selected, the search in the hardware catalog is restricted to the displayed inserted hardware components.

Information on hardware components (Page 322)

Working with racks

Introduction

To assign modules to a device, you need a rack, for example a mounting rail. Secure the modules on the rack and connect these via the backplane bus with the CPU, a power supply or other modules.

Creating a rack

If you insert a device in the network view, a station and a rack suitable for the device selected are created automatically. The rack and slots available are displayed in the device view. The number of slots available again depends on the type of device used.

Rack structure

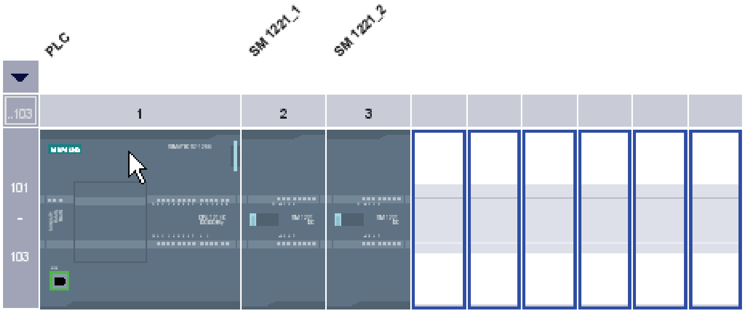
A rack always contains the device that has been inserted in the network view. The device is permanently assigned a slot which will depend on the type of device in question. There are additional slots on the right of the device and, if necessary, on left of the device; slot numbers are located above slots in which devices are plugged.

A corresponding short description is displayed above the plugged devices and modules. You show or hide this short description via the toolbar under "View" with the command "Display module titles" or the corresponding symbol in the toolbar of the device view (Page 310).

Symbol	Meaning
	Show module titles

When modules are selected in the hardware catalog, all the slots permitted for this module are marked. This allows you to see immediately the slot into which the selected module can be inserted.

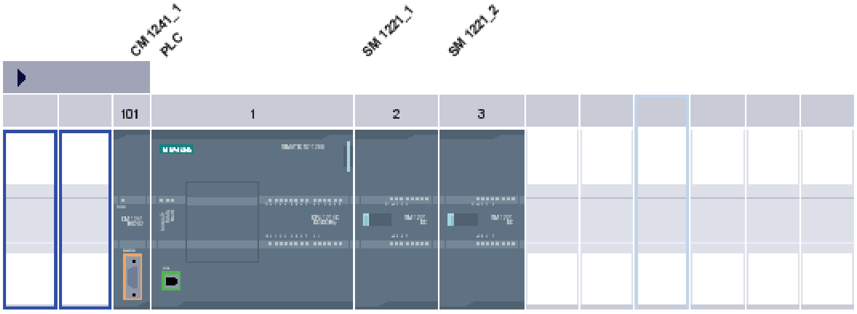
In the following screenshot, a signal module has been selected in the hardware catalog for a partially filled S7-1200 rack:



Since slots 101-103 are reserved for communications modules, only the other free slots are shown as available slots.

You can expand and collapse the front group of slots using an arrow symbol above the expandable slot. When the group of slots is collapsed, the first and last of the group's slot numbers are displayed.

The following figure shows the expanded slot group:



Groups of slots into which modules have already been plugged cannot be collapsed.

Multiple selection of modules and slots

There are various ways of selecting several modules or slots:

- By pressing <Shift> or <Ctrl>, you can select several modules or slots at the same time.
- Click outside the rack and then hold the mouse button and drag a frame to include the modules or slots you want to select.

Objects in the device view

A graphic display of the rack and the devices plugged into it is shown in the upper section of the device view.

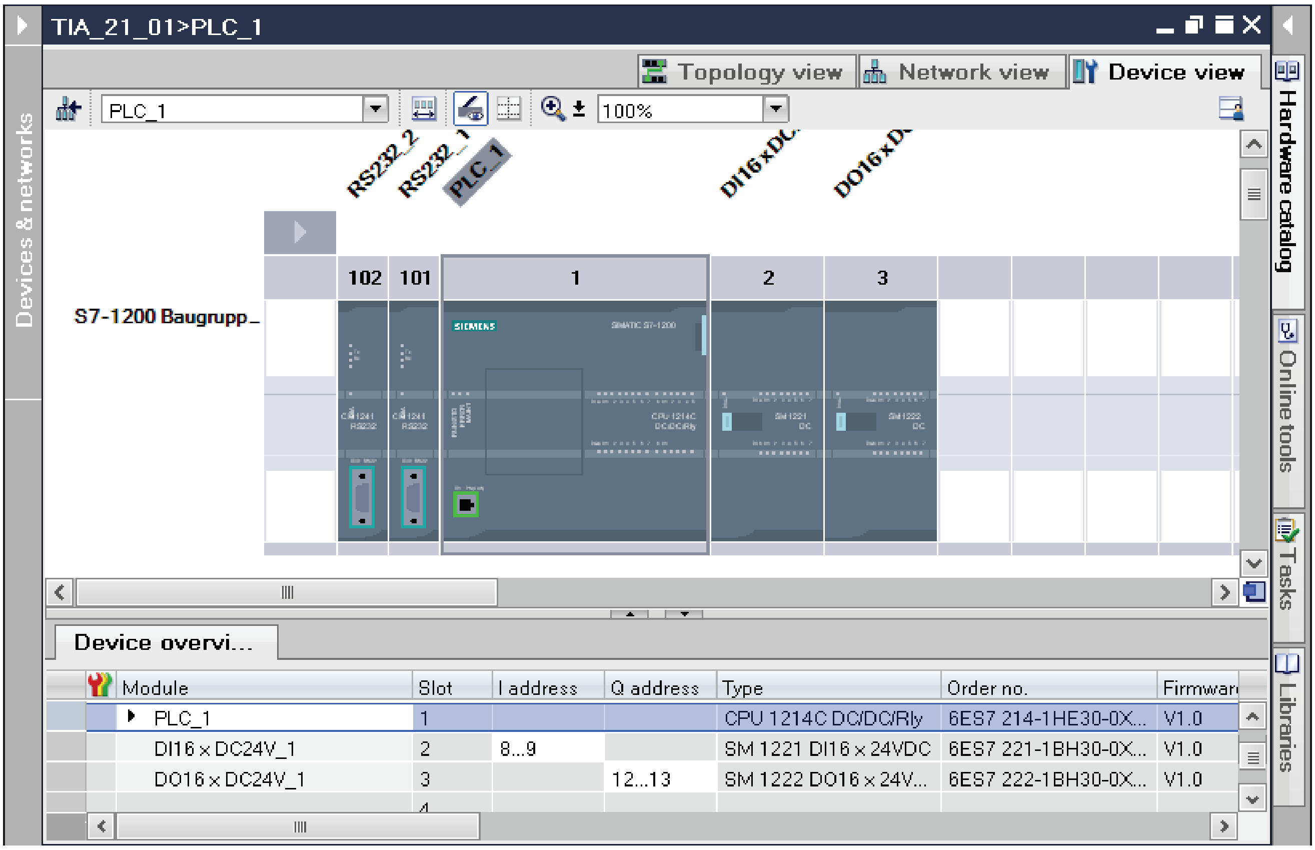
You can see the device overview in the bottom part of the device view. The device overview is a table showing you the most important information about the modules inserted in the rack.

Structure and content of device view

The offline configuration of the devices in the rack are displayed in the graphic device view. This is a symbolic representation of the configuration on the real rack.

The rack configuration is displayed as a table in the device view. Each line in the table contains the information for assigning a slot.

The following screenshot shows the device view with the configuration of a SIMATIC S7-1200 CPU.



Module	Slot	I address	Q address	Type	Order no.	Firmwar
PLC_1	1			CPU 1214C DC/DC/Rly	6ES7 214-1HE30-0X...	V1.0
DI16 x DC24V_1	2	8...9		SM 1221 DI16 x 24VDC	6ES7 221-1BH30-0X...	V1.0
DO16 x DC24V_1	3		12...13	SM 1222 DO16 x 24V...	6ES7 222-1BH30-0X...	V1.0
	4					

In the upper part, you can see the graphic view showing how the rack is occupied by various modules in slots 1 to 3 as well as 101. In the lower part you can see a tabular representation of the rack in the device overview.

Each line in the device overview represents one slot. The key information for each slot is displayed in the various columns:

Column	Meaning
Module	Name of module, can be edited in any way
Slot	Slot number
I address	Input address area, can be edited in any way
Q address	Output address area, can be edited in any way
Type	Catalog name of module
Order no.	Module order number
Firmware	Firmware version of module
Comments	Optional comments

Device view (Page 310)

Area for unplugged modules

In some cases, the modules for a hardware configuration are not assigned a slot for short periods. Such unplugged modules are moved to the area of unplugged modules, a special area in the device view.

Adding modules to the storage area

The modules, which for example are to be assigned to a device using a copy action but for which the corresponding rack does not have a free compatible slot, are moved automatically into the area of unplugged modules.

Under the following conditions, modules are automatically added to the area of unplugged modules:

- In the network view, a module is moved to a device but the rack does not have a compatible free slot.
- In the device view, a module is moved from the rack, the hardware catalog or the project tree straight into the storage area.

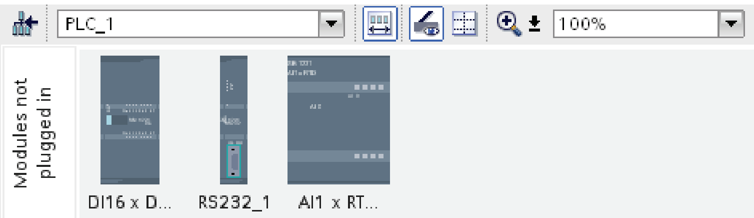
CPs and FMs which occupy a network resource can be moved into the area for unplugged modules but will lose the network resources they have been assigned.

You can add modules to the area of unplugged modules by means of drag-and-drop, for example. To do this, the area must be opened.

Using the area of unplugged modules

Use the corresponding button to open the area of unplugged modules.

You can find the area of unplugged modules in the device view.



You open the area of unplugged modules with the respective symbol in the toolbar of the device view (Page 310).

Symbol	Meaning
▤	Open area of unplugged modules

Note

To free up slots, move modules from your configuration into the storage area and plug the modules you want from the storage area into the freed up slots.

You can use this approach to temporarily move modules that have already been parameterized out of the configuration without deleting them.

Treatment of modules in the storage area

The following rules apply to modules in the storage area:

- The modules appear in the project tree under the corresponding device in the "Local modules" folder.
- The modules retain all settings and parameters previously provided.
- The modules are not taken into account when downloading to a target system so a consistency check is not undertaken for modules in the area of unplugged modules.
- Using the context menu, the modules can be copied, pasted or deleted, for example.

8.1.2.2 Configuring individual devices

Selecting a CPU

Introduction

Select a CPU from the hardware catalog and place it, together with a rack, in the network view. On this device drag the desired modules from the hardware catalog; they are arranged automatically on the rack.

Selecting the components in the hardware catalog

Each hardware component is displayed as a folder in the hardware catalog. When you open this folder you will see the different versions of the selected hardware component with its respective order numbers.

There will be an example of how to set up a CPU with a rack in network view.

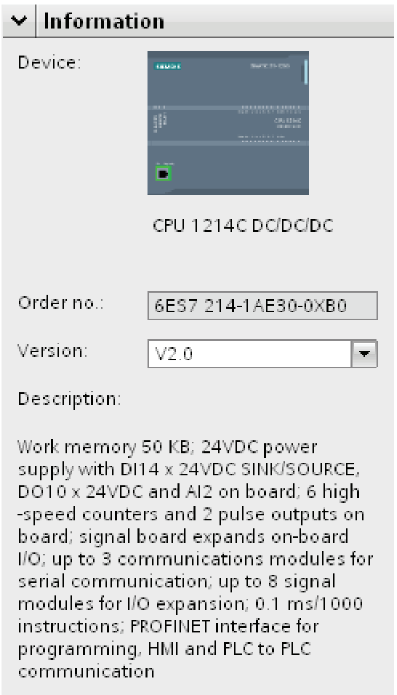
Requirement

- The hardware catalog is open.
- You must be in the network view.

Procedure

To select a CPU from the hardware catalog, proceed as follows:

1. In the hardware catalog navigate to the folder with the desired CPUs.
2. Open the folder with the desired CPU type; you will see all order numbers for the selected CPU type.
3. Click on a CPU order number to get information about the selected CPU under "Information" pane.



Information

Device:

CPU 1214C DC/DC/DC

Order no.: 6ES7 214-1AE30-0XB0

Version: V2.0

Description:

Work memory 50 KB; 24VDC power supply with DI14 x 24VDC SINK/SOURCE, DO10 x 24VDC and AI2 on board; 6 high -speed counters and 2 pulse outputs on board; signal board expands on-board I/O; up to 3 communications modules for serial communication; up to 8 signal modules for I/O expansion; 0.1 ms/1000 instructions; PROFINET interface for programming, HMI and PLC to PLC communication

4. Set up the CPU and a rack. You have the following options:
   - Use drag-and-drop to drag the CPU from the hardware catalog into network view.
   - Use Copy & Paste to copy the CPU to the network view.
   - Double-click the CPU entry in the hardware catalog.

Creating an unspecified CPU (Page 337)

Information on hardware components (Page 322)

Adding a device to the hardware configuration

Introduction

There are various ways of adding a connectable device from the hardware configuration in the network view and the topology view:

- Command "Add new device" in the project tree
- Double-click device in hardware catalog
- Drag-and-drop from the hardware catalog in network view or in topology view:
  - Text entry from the "Catalog" pane
  - Preview graphic from the "Information" pane
- "Add > Device" command from menu bar in network view or topology view
- Shortcut menu of a device in the hardware catalog for copying and pasting

A suitable rack is created along with the new device. The selected device is inserted at the first permitted slot of the rack.

Regardless of the method selected, the added device is visible in the project tree and the network view of the hardware and network editor.

Adding device using the project tree

To use the project tree to add a device to the hardware configuration, proceed as follows:

1. Click on the command "Add new device" in the project tree.

   The "Add new device" dialog box opens.

2. Display the required device in the tree structure:
   - Go to required device in the tree structure.
   - Enter a device name in the entry field.
3. Select the required device from the tree.

   More information about the device presently selected is displayed on the right-side of the dialog box.

4. If necessary, set the firmware version using the drop-down list in the dialog box.
5. Select the "Open device view" check box if you want to change to the device view immediately after adding the device.

   There you can immediately continue with device configuration and equipping the rack.

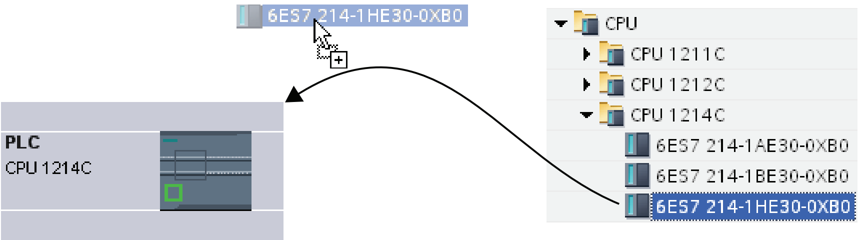
6. Click on "OK" to add the device selected.

   The dialog box closes.

Adding device from the hardware catalog

To add a device to the hardware configuration using the hardware catalog, proceed as follows:

1. Open the network view or the topology view.
2. Open the hardware catalog.
3. Go to the required device in the hardware catalog.
4. Click on the chosen device to select it.
5. If necessary, set the firmware version using the drop-down list in the hardware catalog.
6. Drag the device to the network view or the topology view.



You have now placed the device in the network view or in the topology view. The displayed rectangle (in other words "Station") symbolizes the plugged device together with its rack and any lower-level modules. Double-click on the device or station to open the device view and view the new rack and inserted device. In the next steps, you can configure the device in the device view and equip the rack with modules.

Network view (Page 307)

Creating an unspecified CPU (Page 337)

Information on hardware components (Page 322)

Topology view (Page 313)

Creating an unspecified CPU

Introduction

If you have not yet selected a CPU but have already started programming or want to use an existing program, you have the option of using an unspecified CPU. You can also adjust some settings with unspecified CPUs. The setting options are restricted to parameters that all CPUs of the same CPU family have in common.

Creating an unspecified CPU in the portal view

To create an unspecified CPU in the portal view, follow these steps:

1. Now, click one of the following options:
   – "Devices & networks > Add new device"
   – "PLC programming" > "Device" button
2. For a device family, select an unspecified CPU from the tree structure of the "Add new device" dialog.
3. Click on "Add".

An unspecified CPU is created and the device view for this CPU appears.

Further options for creating unspecified CPUs

In the project view, you can create unspecified CPUs like specified CPUs:

- Using the "Add new device" button in the project tree
- In the "Hardware catalog" task card

You can also use these methods to create multiple unspecified CPUs.

Specifying unspecified CPUs

You have two options for specifying unspecified CPUs:

- Use drag-and-drop to assign an existing CPU from the hardware catalog to an unspecified CPU by means of module replacement (Page 344).
- Select an unspecified CPU and then click "Online > Hardware detection" in the menu bar and assign a CPU identified online. For this purpose, you assign an IP address using the "Add address for PG/PC" button.

Selecting a CPU (Page 334)

Adding a device to the hardware configuration (Page 336)

Inserting a module into a rack

Introduction

Once you have added devices from the hardware catalog to your configuration in network view, you can add modules to the devices. There are various ways of adding a module to a rack in the device view:

- If there is an available valid slot, double-click a module in the hardware catalog.
- Use drag-and-drop to move the module from the hardware catalog to an available valid slot in the graphic or table area:
  - Text entry from the "Catalog" pane
  - Preview graphic from the "Information" pane
- Select "Copy" in the shortcut menu for a module in the hardware catalog and then select "Paste" in the shortcut menu on an available valid slot in the graphic or table area.

To access the device view from the network view, double-click a device or station in the network view or select the Device view tab. The device view contains an illustration of the device selected within a rack. The graphic illustration of the rack in the software corresponds to the real structure, i.e. you can see the same number of slots as exist in the real structure.

Note

You can also move a module to a rack in the network view. The filter function for the hardware catalog must be deactivated in this instance. The module is automatically plugged into a free and permitted slot. If there are no slots available, the module will be moved to the area of unplugged modules (Page 332).

Equipping a rack

Arrange the modules on a rack according to the applicable slot rules.

After a module has been inserted in a rack with an already inserted CPU, the address areas are checked automatically so that addresses are not assigned twice. After it has been inserted, each module then has one valid address range. To do so, DP slaves and IO devices must be networked with a CPU via the corresponding DP master or IO system.

Requirements

- You are in the device view.
- The hardware catalog is open.

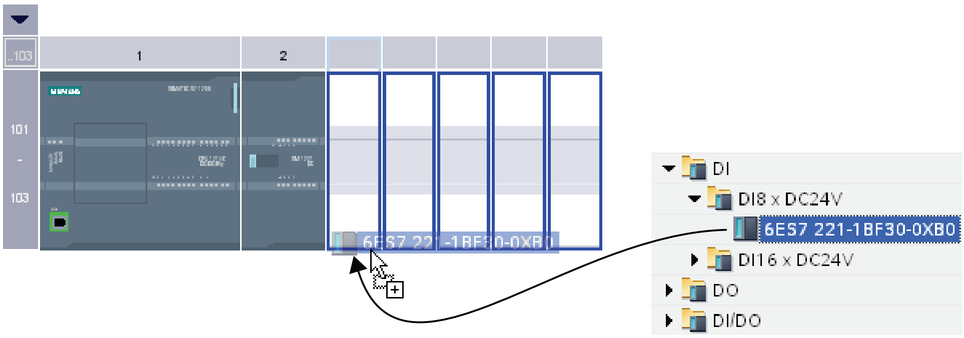
Adding module from the hardware catalog

How to insert a module from the hardware catalog into a rack is illustrated based on the example of a signal module. To do this, follow these steps:

1. Go to the required module board in the hardware catalog.

> **Note**
>
> If you activate the filter function of the hardware catalog, only those modules which match the selected device type will be displayed.

2. Select the chosen module.
3. If necessary, set the firmware version using the drop-down list in the hardware catalog.
4. Drag the signal module to a free slot in the rack.

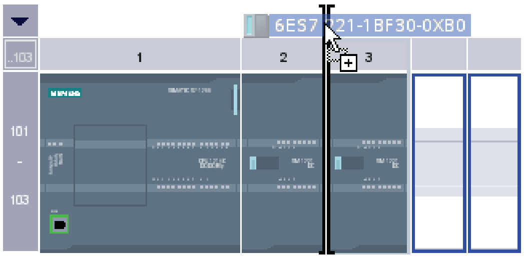


You have now inserted the digital signal module in a slot in the rack. Repeat these steps with the other modules.

The name of the module is displayed above the inserted modules. You can activate or deactivate module labeling in the menu bar with "View > Show module labels".

Inserting module

You can also drag modules and drop them between modules that have already been inserted. To do this, drag a module above and between the two existing modules while holding down the mouse button.



A mouse pointer appears. When you release the mouse button, all modules plugged to the right of the pointer are moved one slot to the right. Any redundant modules are moved to the area of unplugged modules. The new module is plugged at the point of the freed up slot.

Device view (Page 310)

Area for unplugged modules (Page 332)

Information on hardware components (Page 322)

General slot rules (Page 327)

Deleting a hardware component

There are various ways of deleting hardware components. Deleted hardware components are removed from the system and assigned addresses made available again.

Rules

- CPUs or modules from the rack and from the area of unplugged modules can be deleted.
- When a rack is deleted in the device view the plugged hardware components are moved to the area of unplugged modules.

Procedure

Proceed as follows to delete a hardware component:

1. Select the hardware components you want to delete.
   - Network view: Select devices or network relevant hardware components in the graphic view or in the network view.
   - Device view: In the graphic view or device overview, select racks or modules in racks or in the area of unplugged components.
   - Topology view: Select devices or hardware components with Ethernet interfaces in the graphic view or in the topology view.
   - Project tree: Select devices or individual hardware components from the tree structure.
2. Select "Delete" from the shortcut menu or press <Del>.

   If the "Delete" menu item is unavailable, your selection contains at least one component that cannot be deleted.

The selected hardware components are deleted.

Note

Deleting hardware components may result in inconsistencies in the project, for example infringement of slot rules. Inconsistencies are reported during the consistency check. Correct the inconsistencies by taking appropriate action, for example, make sure that slot rules are kept to.

See also

Keyboard action in the hardware and network editor (Page 324)

Copying a hardware component

You can copy hardware components in the device or network view. Copied hardware components are stored on a clipboard and can be pasted at another point from this clipboard. Copied stations are pasted as new stations in the network view. Copied devices and modules can be pasted into existing racks in the network and device view.

Rules

- Single objects as well as several objects can be copied at the same time.
- Modules inserted in the rack and in the area of unplugged modules can be copied.
- You can only copy devices and modules to free and valid slots in keeping with the slot rules.
- Racks with a CPU inserted cannot be copied individually, but only as complete units along with all inserted hardware components.

Procedure

Proceed as follows to copy a hardware component:

1. Select the hardware components you want to copy.
   - Device view: Select the module in a rack or put it in the area of unplugged modules.
   - Network view: Select the station or the relevant hardware component from the network view.
   - Project tree: Select the station or module.
2. Select "Copy" from the shortcut menu or press <Ctrl+C>.

   If the "Copy" menu item is unavailable, your selection contains at least one component that cannot be copied.
3. Select the location at which the content of the clipboard is to be pasted.
   - Device view: Select a free slot in the rack or area of unplugged modules.
   - Network view: Select a station where you want to insert devices or modules or move the mouse pointer to a free location in the network view to paste a copied station or a hardware component relevant to the network view.
4. Select "Paste" from the shortcut menu or press <Ctrl+V>.

   If the "Paste" menu item is unavailable, the clipboard is empty or contains at least one component that cannot be pasted at this point.

The selected object is pasted at the chosen point.

Once you have selected a station where you want to insert a module in the network view, the module is inserted in the first free and valid slot. If no free, valid slots are available, the object is inserted in the area of unplugged modules.

Note

You can also copy a module from one device to another:

To do so, copy a module in the hardware and network editor, select a different device in the network view or the drop down list of the device view and insert the module.

You can insert the copied object directly in a slot or place it in the area of unplugged modules in the device view. If you add the copied object in the network view of a device or a station, it will be inserted in the first available slot.

If there is no slot available for the object, it is automatically placed in the area of unplugged modules (Page 332).

Note

You can use <Ctrl> and drag-and-drop to directly copy a selected hardware component.

Keyboard action in the hardware and network editor (Page 324)

Moving a hardware component

You can move hardware components in the device or network view.

Rules

- You can move devices and modules from the rack and the area for unplugged modules taking the slot rules into consideration.
- CPs can be moved in the network view. The CP is plugged in a free and valid slot in the target device. If there are no free slots available, the CP to be inserted is moved to the area for unplugged modules.
- In the network view, CPU and slave head modules can be moved between the devices; depending on CPU type also within the rack.

Note

Moved CPs are disconnected from their network but keep their network parameters and address. If you reconnect the CP to the network and its address has been assigned, use a dialog to assign a new unique address to the CP.

Procedure

Proceed as follows to move a hardware component:

1. Select the hardware component you want to move.
   – Device view: Select the module in a rack or put it in the area of unplugged modules.
   – Network view: Select the hardware component of relevance to the network view.
2. Select "Cut" from the shortcut menu or press <Ctrl+X>.

   If the "Cut" menu item is unavailable, your selection contains at least one component that cannot be cut.
3. Select the location to which the cut object is to be moved.
   – Device view: Select a free slot in the rack or area of unplugged modules.
   – Network view: Select a station where you want to insert devices or modules.
4. Select "Paste" from the shortcut menu or press <Ctrl+V>.

   If the "Paste" menu item is unavailable, the clipboard is empty or contains at least one component that cannot be pasted at this point.

The selected hardware component is moved to the target. If the hardware component being moved is a networked object, it is disconnected from the network.

Note

You can use drag-and-drop to directly move a selected hardware component.

See also

Keyboard action in the hardware and network editor (Page 324)

Replacing a hardware component

You can replace hardware components with others. This, for example, allows you to replace unspecified CPUs (Page 337) with available CPUs from the hardware catalog.

Rules

You can only replace hardware components if they support module replacement and if the two components are compatible.

Procedure

To replace one module with another, proceed as follows:

1. Select the module you want to replace.
2. Open the shortcut menu:
   - If the "Replace device" entry is enabled, the module can be replaced.
   - If the "Replace device" entry is disabled, a module cannot be replaced.
3. Click on "Replace device" in the shortcut menu. ### The "Replace device" dialog box appears.
4. Under "New device" in the tree structure, select the module with which you want to replace your current module.
5. Click "OK".

The existing module is replaced by the new one.

As an alternative, you can take a module by dragging it from the hardware catalog to the module you are replacing. If the module can be replaced by the selected module, this is indicated by the mouse pointer symbol.

Editing properties and parameters

Once you have inserted hardware components in your rack, you can edit their default properties, for example parameters or addresses in the network or device view.

Requirements

You are in the device view.

Note

You can also edit properties and parameters in the network view. In the graphic network view, you have access to the network-related hardware components and the station. You can access modules and hardware components not displayed in the graphic network view using the table network view.

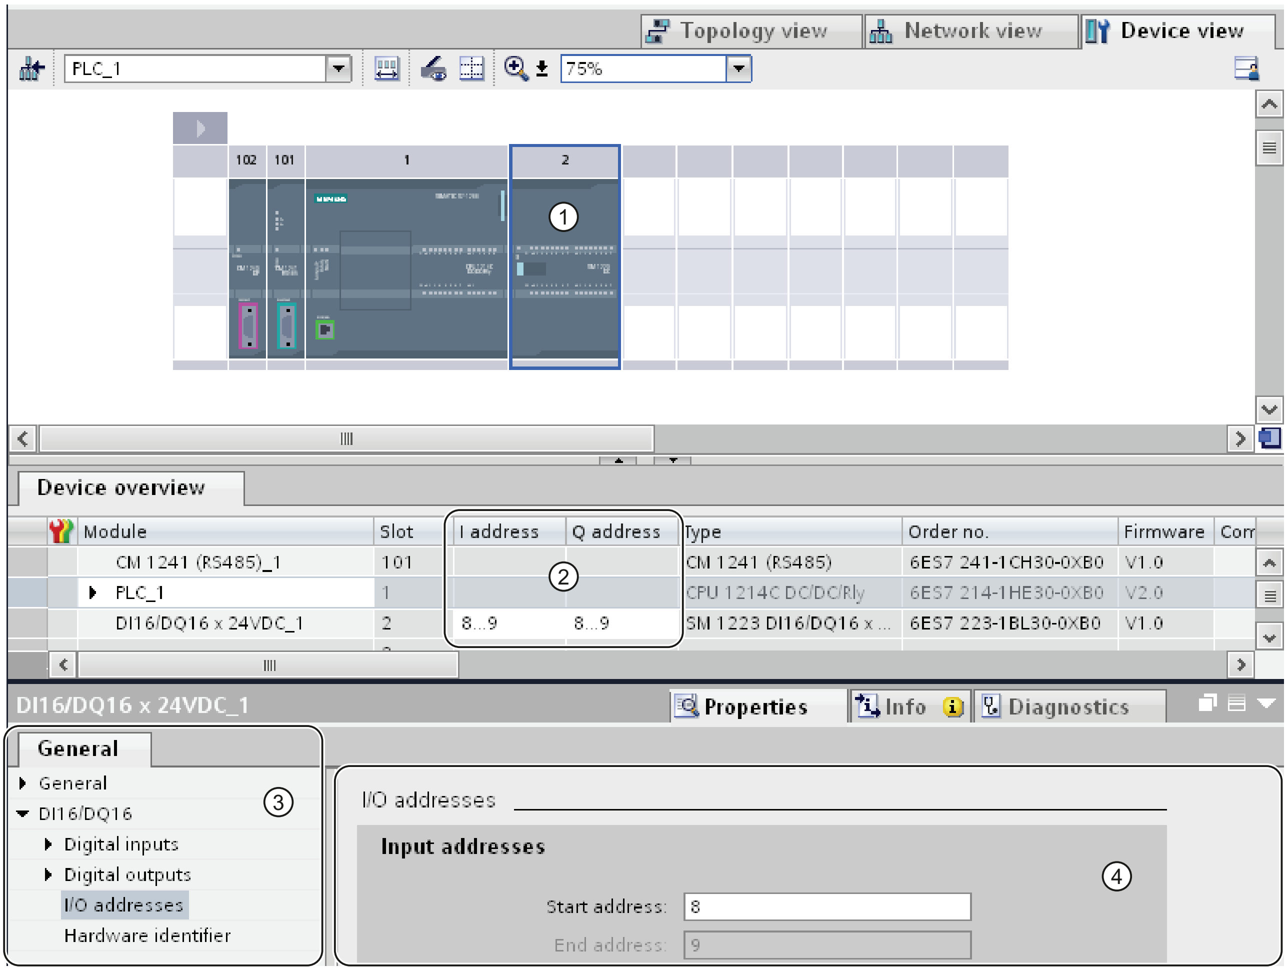
Procedure

To change the properties and parameters of the hardware components, proceed as follows:

1. In the graphic view, select the CPU, module, rack or interface you want to edit.
2. Edit the settings for the selected object:
   - Use the table view to edit addresses and names, for example.
   - In the Inspector window additional setting possibilities are available in "Properties".

Note that modules can only be fully parameterized if they are assigned to a CPU. Therefore, PROFIBUS or PROFINET interfaces modules must first be networked with the CPU or a centrally inserted communication module so that they form a master system or IO system. Only then is it possible, for example, to edit the addresses of the distributed components that are inserted.

Example of changing settings



Module	Slot	I address	Q address	Type	Order no.	Firmware	Com
CM 1241 (RS485)_1	101			CM 1241 (RS485)	6ES7 241-1CH30-0XB0	V1.0	
PLC_1	1			CPU 1214C DC/DC/Rly	6ES7 214-1HE30-0XB0	V2.0	
DI16/DQ16 x 24VDC_1	2	8...9	8...9	SM 1223 DI16/DQ16 x ...	6ES7 223-1BL30-0XB0	V1.0	

Input addresses

Start address: 8

End address: 9

Update module version

Explanation of terms

The terms "Module version" and "Firmware version" are explained in more detail in the following section.

- Module version: The specific version of the configuration software from which the module description stems.

  Exp.: V11.0.0.0

- Firmware version: The version of the firmware of the offline configured module

  Exp.: V2.0

Requirements

- You have created a device configuration.
- You have installed an update or an optional package at a later date. As a result of this installation, the module version of at least one module type was updated in the hardware catalog, whereby the new version is incompatible with the previous version.
- You have used such modules in your device configuration and want to use the modified or added properties.

Procedure

Perform the following step for each affected module type.

1. Select the affected module in the device view.
2. In the Inspector window, go to "Properties > General > Catalog Information". Click the "Update module version" button there.
3. In the query that then appears, specify whether you want to update the module version only for the selected module or for all modules of this type in the current project.

Result

The selected modules are replaced by the same modules with updated module version in the the current project.

In which cases is it unnecessary to update the module version?

An updating of the module version is not necessary in the following cases:

- You do not want to used the modified or added properties of the modules.
- You open an existing project with a version of the configuration software that is more recent than the version with which you created the project and the system automatically performs a project conversion, for example from V10.5 to V11.0. In this case, all older module versions are automatically adapted.

8.1.3 Configure networks

8.1.3.1 Networking devices

Communication and networks

Communication between devices

The basis of all types of communication is always a previously configured network. The network configuration provides the necessary requirements for communication:

- All the devices in a network are provided with a unique address
- Communication of the devices with consistent transmission properties

Network configuration

The following steps are necessary when configuring networks:

- Connect devices to subnet
- Specify the properties/parameters for each subnet
- Specify the device properties for every networked module
- Download configuration data to the devices to supply interfaces with the settings resulting from the network configuration
- Document the network configuration

For Open User Communication, creating and configuring a subnet is supported by the assignment of connection parameters.

Relation between network configuration and project

Within a project, subnets and their properties are managed. Properties result mainly from adjustable network parameters and the quantity and communication properties of the connected devices.

The devices to be networked must be in the same project.

Subnet name and subnet ID

Within the project, subnets are clearly identified by a subnet name and ID. The subnet ID is saved in all components along with interconnectable interfaces. Components can then be clearly assigned to a subnet even after uploading into a project.

Networking options

In the project, you can create and network devices with components capable of communication. The following basic options are available for networking the devices:

- You link the interfaces of the components capable of communication with one another. A new subnet is created suitable for the type of interface.
- You connect the interface of the devices capable of communication with a new or existing subnet.
- You create an Open User Communication connection. When you assign parameters to the connection for Open User Communication, a subnet is created automatically between the communication partners.
- You use the graphic connection configuration to configure connections; missing networks are hereby recognized and are created either automatically or via dialog.

Due to the different tasks of the devices or the span of the plant, you may need to use several subnets. These subnets are managed in a project.

Networking devices in the network view

Options

In the graphic network view, you have an overview of the subnets of the entire system in the project. You can use the tabular network overview for additional support.

Depending on the starting situation, there are various ways of undertaking configuration to network the interface for a component capable of communication. The procedures are described in the following section:

- Creating an individual subnet
- Creating several subnets at one time
- Connecting two target devices via a new subnet
- Connecting devices to existing subnet
- Selecting an existing subnet from a list
- Automatic networking during the configuration of the connection;

  See also: Auto-Hotspot

Possible starting situations are:

- A suitable subnet is not yet available.
- The subnet with which you want to connect the component already exists.

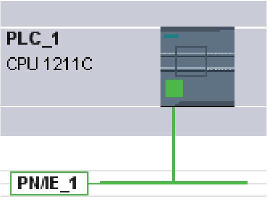
Procedure - creating a single subnet

To create a subnet and to connect it to an interface, proceed as follows:

1. Select the interface of a CPU / a CP.
2. Select the "Create subnet" command in the shortcut menu of the interface.

The selected interface is connected to a new subnet. Consistent address parameters are set automatically for the interface.

The following schematic shows an interface with outgoing line connecting to a subnet:



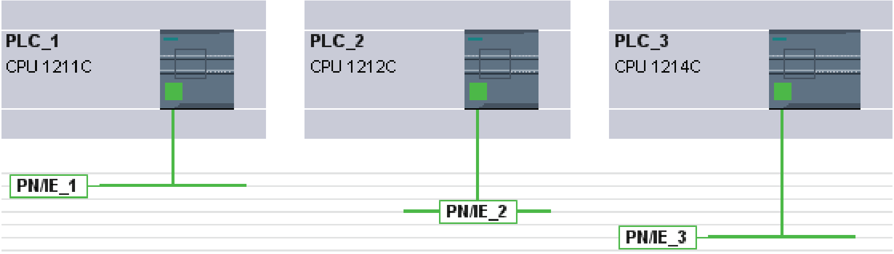
Procedure - creating several subnets at one time

To create several subnets at one time, proceed as follows:

1. Select several interfaces by clicking on them while pressing the <Ctrl> button.
2. Select the "Create subnet" command in the shortcut menu of the interface.

Each selected interface is connected to a new subnet. Consistent address parameters are set automatically for the interface.

The following figure shows multiple subnets created by selecting multiple interfaces:

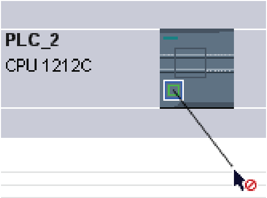


Procedure – Connecting two target devices via a new subnet

To connect an interface with another device via a subnet that does not yet exist, proceed as follows:

1. Position the mouse pointer over the interface for a component capable of communication requiring networking.
2. Click with the left mouse button and hold the button down.
3. Move the mouse pointer.

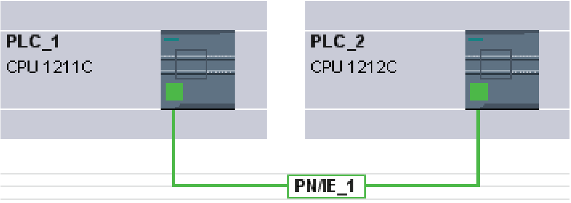
   The pointer now uses the networking symbol to indicate "Networking" mode. At the same time, the mouse pointer shows the lock symbol that will only disappear when the pointer is on a valid target.

4. Now move the pointer onto the interface of the target device. You can either keep the mouse button pressed or release it.
5. Now release the left mouse button or press it again (depending on previous action).

A new subnet is created. The interfaces are now connected via the new subnet. Consistent address parameters are set automatically for the interface.

The following schematic shows two networked devices:

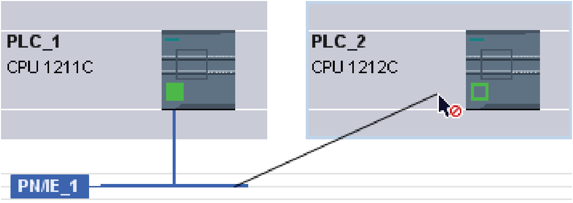


Procedure - Connecting devices to existing subnet

To connect an interface to an existing subnet, proceed as follows:

1. Position the mouse pointer on the interface of a communications-compliant component you want to network or on the existing subnet.
2. Click with the left mouse button and hold the button down.
3. Move the mouse pointer.

   The pointer now uses the networking symbol to indicate "Networking" mode. At the same time, the mouse pointer shows the lock symbol that will only disappear once the pointer is moved to a valid target.
4. Now move the mouse pointer to the existing subnet or to the interface to be networked. You can either keep the mouse button pressed or release it.



5. Now release the left mouse button or press it again (depending on previous action).

Result:

The interface and selected subnet are now connected. Consistent address parameters are set automatically for the interface.

Procedure - selecting an existing subnet from a list

To link an interface with a subnet that has already been created, proceed as follows:

1. Select the interface of a CPU.
2. Select the "Assign to new subnet" command in the shortcut menu of the interface.

   A list box containing the available subnets appears.
3. Select a subnet from the list.

The interface and selected subnet are now connected. Consistent address parameters are set automatically for the interface.

Tabular network overview

Meaning

The tabular network overview adds the following functions to the graphic network view:

- You obtain detailed information on the structure and parameter settings of the devices.
- Using the "Subnet" column, you can connect components capable of communication with created subnets.

Basic functions for tables

The network overview supports the following basic functions for editing a table:

- Displaying and hiding table columns

  Note: The columns of relevance to configuration cannot be hidden.
- Optimizing column width
- Sorting table
- Displaying the meaning of a column, a row or cell using tooltips.

Networking devices in the device view

Networking in the device view

In the device view, you can check and set all the parameters of the components belonging to a device and the interfaces in detail. Here you can also assign the interfaces to the subnets created in the project.

Requirements

- The subnet with which you want to connect an interface has already been created.
- If the subnet has not yet been created, change to the network view and make the settings required for networking.

Procedure - connecting to an existing subnet

To connect an interface to an existing subnet, proceed in the device view as follows:

1. Select the entire communications-compliant component or the interface to be networked. The properties of the selected interface or component are displayed in the Inspector window.
2. In the Inspector window, select the parameter group for the selected interface; for example, the "Ethernet addresses" parameter group for a PROFINET interface.
3. Select the subnet to be connected from the "Interface connected with" drop-down list.

The interface and selected subnet are now connected. Consistent address parameters are set automatically for the interface.

Procedure - creating a new subnet

To create a subnet and to connect it to the interface, proceed as follows in the device view:

1. Select the entire communications-compliant component or the interface to be networked. The properties of the selected interface or component are displayed in the Inspector window.
2. In the Inspector window, select the parameter group for the selected interface; for example, the "Ethernet addresses" parameter group for a PROFINET interface.
3. In "Interface connected with", click the "Add new subnet" button.

The interface is connected to a new subnet of the appropriate subnet type. Consistent address parameters are set automatically for the interface.

Checking or changing network parameters and interface parameters

Introduction

Communication between networked devices requires the following parameters to be configured:

- Network parameters

  Network parameters identify the network within the system configuration, for example, using a name.
- Interface parameters

  Interface parameters define specific properties of a component capable of communication. Addresses and transmission characteristics are set automatically and are consistent with the network parameters.

  Note

  Network parameters and interface parameters are usually set during networking such that communication can take place for numerous applications without the parameters having to be changed.

Procedure - checking or changing network parameters

Proceed as follows to check or change network parameters:

1. Enter the network view.
2. Select the subnet from the network view.

   You can see the network parameters in the "Properties" tab in the inspector window.
3. If necessary, check or modify the network parameters in the relevant group of parameters.

Procedure - checking or changing interface parameters

You can check and modify interface parameters in the network and device view.

Proceed as follows to check or change interface parameters:

1. Enter the network view or device view.
2. Select the interface.

   You can see the interface parameters in the "Properties" tab in the inspector window.
3. If necessary, check or modify the interface parameters in the relevant group of parameters.

Changing networkings

Introduction

You can cancel an interface's network connection or assign it to another subnet of the same subnet type.

Consequences

Depending on the version, a distinction should be made between:

- Canceling a network connection for an interface

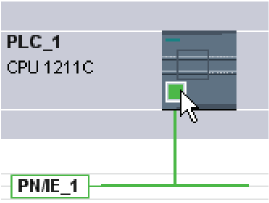
  The configured parameters for the interface remain unchanged.
- Assigning a network connection to another subnet

  If the addresses in the assigned subnet are not unique, in other words, they already exist, they will be changed automatically to make them unique.

Procedure - disconnecting from a network

Proceed as follows to cancel the network connection for an interface:

1. Select the networked interface.



2. Select the "Disconnect from subnet" command in the shortcut menu of the interface.

The network connection is deleted, the interface addresses are, however, not changed.

Configured connections are retained; however these connections are marked red in the connection table because they are not networked. Specified connections remain specified.

See also

Networking devices in the network view (Page 349)

Copying, cutting or deleting subnets

Introduction

You can copy subnets as individual objects or copy them along with networked devices or other networks.

For example, you can create complex configurations to be used more than once in different variants within the project with no additional effort.

Effects on the copied subnet

Properties that have to be assigned explicitly within a project are re-assigned appropriately when the copied objects are copied.

For subnets, this means: The subnet ID and name are re-assigned to the copied subnet.

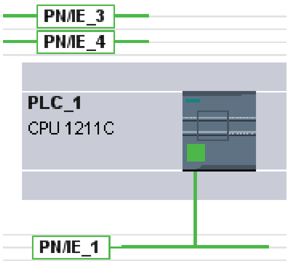
The configured properties are adopted in the copied subnet.

Procedure - copying a subnet

Proceed as follows to copy one or more subnets:

1. Select one or more subnets.
2. In the shortcut menu, select the "Copy" command.
3. Select the "Paste" command in the shortcut menu.

The copied subnets are shown as "orphaned" subnets in the top part of the network view.



Procedure - copying a subnet with connected devices

To copy one or more subnets with networked devices, proceed as follows:

1. Select one or more subnets with the connected devices, for example by drawing a lasso around them.
2. In the shortcut menu, select the "Copy" command.
3. Select the "Paste" command in the shortcut menu.

Complete copies of the subnets and connected devices are created.

Configured connections are adopted and remain within the copied devices. Connections to devices that have not been copied are interrupted and become unspecified.

MPI network configuration

Allocating MPI addresses

Note the following for devices with an MPI interface: All devices of a subnet must have different device addresses.

CPUs with MPI address ship with the default MPI address 2. Since you can only use this address once in the MPI subnet, you will have to change the default address in all other CPUs.

The following applies to devices with the order no. 6ES7 3xx-xxxxx-0AB0:

When planning the MPI addresses for several CPUs, you have to fill "MPI address gaps" for FMs and CPs with separate MPI addresses to prevent addresses being assigned twice.

Only when all the modules in a subnet have different addresses and your actual structure matches that of the network configuration produced, should you load the settings across the network.

Rules for assigning the MPI address

- Allocate the MPI addresses in ascending order.
- Reserve MPI address 0 for a programming device.
- You can link up to 126 (addressable) devices with one another in an MPI subnet; up to 8 devices at a transfer speed of 19.2 KB/s.
- All MPI addresses in an MPI subnet must be different.

You will find other rules relating to the structure of a network in the manuals for setting up automation systems.

PROFIBUS network configuration

PROFIBUS addresses

Rules for the network configuration

All the devices in a subnet must have a different PROFIBUS address.

Only when all the modules in a subnet have different addresses and your actual structure matches that of the network configuration produced, should you load the settings across the network.

You can connect devices to the PROFIBUS subnet that communicate via configured connections or that belong to a PROFIBUS DP master system.

You can find more information on configuring a DP master system in the following sections.

Requirements

The 121xC CPU is PROFIBUS compatible as of firmware version 2.0.

Rules for assigning PROFIBUS addresses

- Allocate the PROFIBUS addresses in ascending order.
- Reserve the PROFIBUS address "0" for a programming device.
- Allocate a unique PROFIBUS address between 0 and 126 for each device on the PROFIBUS network and/or for each DP master and each DP slave in the PROFIBUS network.
- There are modules with which the smallest address that can be set has to be greater than 1.
- All PROFIBUS addresses of a PROFIBUS subnet must be different.

You will find additional rules relating to the structure of a network in the manuals for setting up automation systems, for example SIMATIC S7-1200.

Note

PROFIBUS address "0"

Reserve PROFIBUS address "0" for a programming device that you will briefly connect up to the PROFIBUS network at a later date for servicing.

See also

What you need to know about PROFIBUS bus parameters (Page 359)

What you need to know about PROFIBUS bus parameters

Matching parameters to one another

The PROFIBUS subnet will only function without problem if the parameters for the bus profile are matched to one another. You should therefore only change the default values if you are familiar with how to configure the bus profile for PROFIBUS.

Note

It may be possible for the bus parameters to be adjusted depending on the bus profile. If the bus parameters cannot be adjusted, they are grayed out. The offline values of the bus parameters are always shown even if you are online and linked to the target system.

The parameters shown apply to the entire PROFIBUS subnet and are briefly explained below.

Activating cyclic distribution of the bus parameters

If the "Enable cyclic distribution of the bus parameters" check box is selected under "Bus parameters" while PROFIBUS subnet is selected in the Inspector window, the bus parameters are transferred cyclically during operation by the modules that support this function. This allows a programming device, for example, to be easily connected to the PROFIBUS in runtime.

You should deactivate this function:

- For a heterogeneous PROFIBUS subnet (or more accurately: when external devices are connected whose protocol uses the DSAP 63 for Multicast)
- When in constant bus cycle time mode (minimize bus cycle)

Bus parameters for the bus profile of PROFIBUS subnets

Bus parameter	Adjustable?	Limit values
Tslot_Init	Yes	Max. Tsdr + 15 <= Tslot_init <= 16.383 t_bit
Max. Tsdr	Yes	35 + 2*Tset + Tqui <= Max. Tsdr <= 1.023 t_bit
Min. Tsdr	Yes	11 t_bit <= Min. Tsdr <= MIN(255 t_bit, ... Max. Tsdr - 1, 34 + 2*Tset + Tqui)
Tset	Yes	1 t_bit <= Tset <= 494 t_bit
Tqui	Yes	0 t_bit <= Tqui <= MIN(31 t_bit, Min. Tsdr - 1)
GAP factor	Yes	1 <= GAP factor <= 100
Retry limit	Yes	1 <= Retry limit <= 15
Tslot	No	---
Tid2	No	Tid2 = Max. Tsdr
Trdy	No	Trdy = Min. Tsdr
Tid1	No	Tid1 = 35 + 2*Tset + Tqui
Ttr	Yes	256 t_bit <= Ttr <= 16.777.960 t_bit
Ttr typical	No	This time is provided for information only and is not transferred to the nodes.
Response monitoring		10 ms <= response monitoring (watchdog) <= 650 s

If you want to create a customized bus profile, we recommend the following settings:

- Minimum target rotation time (Ttr) = 5000 x HSA (highest PROFIBUS address)
- Minimum response monitoring (watchdog) = 6250 x HSA

Recalculating

You can use the "Recalculate" button to recalculate the parameters.

See also

PROFIBUS addresses (Page 358)

Description of the bus parameters (Page 361)

Description of the bus parameters

Detailed description of PROFIBUS bus parameters

Bus parameter	Meaning
Tslot_Init	The wait-for-reception (slot time) defines the maximum time the sender will wait to receive a response from the addressed partner. If the influence of the line components on message frame run times is entered in the "Cable Configuration" parameter group, these components must also be taken into account. The component is added to the specified Tslot_Init and the total used as Tslot.
Max. Tsdr	The maximum protocol processing time defines the latest time by which the responding node should have replied.
Min. Tsdr	The minimum protocol processing time defines the earliest time by which the responding node may reply.
Tset	The trigger time is the time which may lapse between the reception of a data message frame and the response to it in the node.
Tqui	The modulator quiet time is the time which a sending node needs after the end of the message frame to switch from sending to receiving.
GAP factor	The GAP update factor defines the number of token rotations after which a newly added, active node can be added to the logical token ring.
Retry limit	This parameter defines the maximum number of attempts (message frame repeats) made to reach a node.
Tslot	The wait-for-reception time (slot time) defines the maximum time the sender will wait to receive a response from the addressed partner. If the influence of the bus design components on message frame run times is entered in the "Cable Configuration" parameter group, these components must also be taken into account. The component is added to the specified Tslot_Init and the total used as Tslot.
Tid2	Idle time 2 defines the earliest time by which a sending node may send the next message frame after sending a message frame that has not been acknowledged.
Trdy	The ready time specifies the earliest time by which a sending node may receive a response message frame.
Tid1	Idle time 1 defines the earliest time by which a sending node may send the next message frame after receiving a response.
Ttr	The target rotation time is the maximum time made available for a token rotation. During this time, all active nodes (DP masters etc.) have the right to send (token) once. The difference between the target rotation time and the actual token holding time of a node determines how much time is left over for the other active nodes (programming device, other DP masters etc.) to send message frames.
Ttr typical	The typical data cycle time is the average response time on the bus if all configured slaves are exchanging data with the DP master. None of the slaves report diagnostics and there is no extra message frame traffic with programming devices or other active nodes etc. on the bus.
Response monitoring	The response monitoring time is only needed for PROFIBUS-DP bus systems. It defines the latest time by which a DP slave has to be addressed by its DP master with a new data message frame. If this does not happen, the DP slave assumes that the DP master has failed and resets its outputs to a secure mode.

What you need to know about PROFIBUS bus parameters (Page 359)

Bus profiles with PROFIBUS

Introduction

Depending on the device types connected and protocols used on the PROFIBUS, different profiles are available. The profiles differ in terms of the setting options and calculation of bus parameters. The profiles are explained below.

Devices with different profiles on the same PROFIBUS subnet

The PROFIBUS subnet only functions without problem if the bus parameters of all devices have the same values. For example, if both DP and FMS services are being used on a subnet, the "slower" sets of bus parameters must always be set for all devices, i.e. even the "Universal (DP/FMS)" profile for DP devices.

Profiles and transmission rates

Profiles	Supported transmission speeds in Kbits/s
DP	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000
Standard	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000
Universal (DP-FMS)	9.6 19.2 93.75 187.5 500 1500
Customized	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000

Meaning of profiles

Profile	Meaning
DP	Select the "DP" bus profile when the only devices connected to the PROFIBUS subnet are those which satisfy the requirements of standard EN 50170 Volume 2/3, Part 8-2 PROFIBUS. The bus parameter setting is optimized on these devices. This includes devices with DP master and DP slave interfaces of the SIMATIC S7 and distributed I/Os of other manufacturers.
Standard	Compared to the "DP" profile, the "Standard" profile also offers scope for devices of another project or devices which have not been configured here to be taken into account when calculating the bus parameters. The bus parameters are then calculated following a simple, non-optimized algorithm.
Universal (DP/FMS)	Select the "Universal (DP/FMS)" bus profile when individual devices on the PROFIBUS subnet use the PROFIBUS-FMS service. This includes the following devices for example: • CP 343-5 (SIMATIC S7) • PROFIBUS-FMS devices of other manufacturers As with the "Standard" profile, this profile allows you to take other devices into account when calculating the bus parameters.
Customized	The PROFIBUS subnet will only function without problem if the parameters for the bus profile are matched to one another. Select the "Customized" profile when none of the usual profiles "match" a PROFIBUS device and you need to adapt the bus parameters to your special structure. Information on this can be found in the documentation for the PROFIBUS device. You should only change the default values if you are familiar with how to configure the bus profile for PROFIBUS. Not all combinations that can be theoretically set can be used even with this bus profile. The PROFIBUS standard specifies several parameter limits that depend on other parameters. For example, a responder must not respond (Min Tsdr) before the initiator can receive the message frame (Trdy). These standard specifications are also checked in the "Customized" profile. Tip: The bus parameters last valid on the PROFIBUS subnet are always automatically set as customized. For example, if the "DP" bus profile was valid for the subnet, then the bus parameters for "DP" are set in the "Customized" bus profile. The parameters can be modified on this basis. The monitoring times are not automatically recalculated so that you do not put at risk the consistency of set values, for example with configurations in other configuration tools without realizing that you have done so. You can also have the Ttr monitoring times and target rotation time calculated on the basis of parameters you have set: Click here on the "Recalculate" button.

Note

Both mono-master mode and multi-master mode are possible with all PROFIBUS profiles.

What you need to know about PROFIBUS line configuration

Cable configuration and bus parameters

Information regarding the cable configuration can be taken into consideration when calculating the bus parameters. For this purpose, you must select the "Consider cable configuration" check box in the properties for the PROFIBUS subnet.

The remaining information then depends on the type of cable used; the following settings are available:

- Copper cable
- Fiber-optic cable/optical ring

PROFIBUS line configuration, optical ring

The calculation depends on the OLM types used. The selection is made by activating the check box (multiple activation is possible, at least one OLM type must be selected):

- OLM/P12
- OLM/G12
- OLM/G12-EEC
- OLM/G12-1300

The following bus parameter adjustments are made:

- Configuration of a node not present

Note

The following restrictions apply to optical rings, even for passive nodes (DP slaves for example):

A maximum of HSA-1 nodes may be connected to the PROFIBUS network. With an HSA of 126, addresses 126 and 125 must not be used. A maximum of 125 nodes are possible on the bus (No. 0 to 124).

If an HSA is less than or equal to 125, the addresses HSA and greater may not be used. The address HSA-1 may not be used.

- Increase the retry value to 3
- Setting of minimum slot time needed for ring mode

Note

Short slot time values are needed for OLM/P12, average ones for OLM/G12 and OLM/G12-EEC and long ones for OLM/G12-1300. This results in high performance for small network lengths and average to low performance for average to large network lengths.

PROFIBUS communication load

Communication load - allowing for additional network stations

The bus parameters depend on the volume of communication between the active network nodes. There are differences between cyclic communication (DP) and connection-based, acyclic communication (S7 communication, Send/Receive (FDL), FMS). Unlike DP, the volume and size of communication tasks (communication load) depends on the user program. For this reason, the communication load cannot always be calculated automatically.

To calculate the bus times you can define a network configuration in the "Additional network stations" parameter group that differs from the network configuration.

Taking the profile into account

The network configuration can be defined for the "Standard", "Universal (DP/FMS)", and "User-defined" profiles. Parameters cannot be entered in the "Additional network stations" parameter group for the "DP" profile.

Quantification of the communication load

The following settings are available in order to make allowance for the communication load.

- Information regarding the number of unconfigured network stations;
- Information on the communication load resulting from the user programs for FDL or S7 communication. Here you can selected from the following settings:
  - Low

    Typically used for DP, no great data communication apart from DP.
  - Medium

    Typically used for mixed operations featuring DP and other communication services (such as for S7 communication), when DP has strict time requirements and for average acyclic volumes of communication.
  - High

    For mixed operations featuring DP and other communication services (such as for S7 communication), when DP has loose time requirements and for high acyclic volumes of communication.

Configuring Industrial Ethernet

Rules for the network configuration

The Ethernet interfaces of the devices have a default IP address that you can change.

IP address

The IP parameters are visible if the module capable of communication supports the TCP/IP protocol. This is usually the case for all Ethernet modules.

The IP address consists of 4 decimal figures in the range of 0 to 255. The decimal figures are separated from one another by a dot.

Example: 140.80.0.2

The IP address consists of:

- Address of the (sub) net
- Address of the node (generally also called host or network node)

Subnet mask

The subnet mask splits these two addresses. It determines which part of the IP address addresses the network and which part of the IP address addresses the node.

The set bits of the subnet mask determine the network part of the IP address.

Example:

Subnet mask: 255.255.0.0 = 11111111.11111111.00000000.00000000

In the example given for the above IP address, the subnet mask shown here has the following meaning:

The first 2 bytes of the IP address identify the subnet - i.e. 140.80. The last two bytes address the node, thus 0.2.

It is generally true that:

- The network address results from AND linking the IP address and subnet mask.
- The device address results from AND NOT linking the IP address and subnet mask.

Relation between IP address and default subnet mask

An agreement exists relating to the assignment of IP address ranges and so-called "Default subnet masks". The first decimal number (from the left) in the IP address determines the structure of the default subnet mask. It determines the number of "1" values (binary) as follows:

IP address (decimal)	IP address (binary)	Address class	Default subnet mask
0 to 126	0xxxxxxx.xxxxxxxx....	A	255.0.0.0
128 to 191	10xxxxxx.xxxxxxxx...	B	255.255.0.0
192 to 223	110xxxxx.xxxxxxxx...	C	255.255.255.0

Note

Range of values for the first decimal point

A value of between 224 and 255 is also possible for the first decimal number of the IP address (address class D etc). This is, however, not recommended because there is no address check for these values.

Masking other subnets

You can use the subnet mask to add further structures and form "private" subnets for a subnet that is assigned one of the address classes A, B or C. This is done by setting other lower points of the subnet mask to "1". For each bit set to "1", the number of "private" networks doubles and the number of nodes they contain is halved. Externally, the network functions like an individual network as it did previously.

Example:

You have a subnet of address class B (for example IP address 129.80.xxx.xxx) and change the default subnet mask as follows:

Masks	Decimal	Binary
Default subnet mask	255.255.0.0	11111111.11111111.00000000.00000000
Subnet mask	255.255.128.0	11111111.11111111.10000000.00000000

Result:

All nodes with addresses between 129.80.001.xxx and 129.80.127.xxx are on one subnet, all nodes with addresses between 129.80.128.xxx and 129.80.255.xxx are on another subnet.

Router

The task of the routers is to connect the subnets. If an IP datagram is to be sent to another network, it first has to be conveyed to a router. To make this possible, you have to enter the address of the router for each node in the subnet.

The IP address of a node in the subnet and the address of the router may only differ at the points at which there is a "0" in the subnet mask.

Network configuration of AS interface

AS-Interface consists of an AS-i master and AS-i slaves connected to each other over an AS-i subnet.

Rules for AS interface network configuration

All the nodes in an AS-i subnet must have a different AS-i node address.

You should only load the settings over the network when all the modules in a subnet have different addresses and when the actual structure matches that of the network configuration you have created.

One AS-i master and up to 31 AS-i slaves can be operated on one AS-i subnet.

For more information on configuring an AS-Interface with an AS-i master and AS-i slaves, refer to the section on AS-Interface and the documentation of the AS-i master modules.

8.1.3.2 Communication via connections

Working with connections

S7 connection

Introduction to configuring connections

Definition

A connection defines a logical assignment of two communication partners in order to undertake communication services. A connection defines the following:

- Communication partner involved
- Type of connection (for example, S7 connection)
- Special properties (e.g., whether a connection is established permanently or whether it is established and terminated dynamically in the user program, and whether status messages are to be sent)
- Connection path

What you need to know about connection configuration

During connection configuration, a local connection name is assigned for an S7 connection as a unique local identification.

In the network view, a "Connections" tab is displayed in addition to the "Network overview" tab. This tab contains the connection table. A row in this connection table represents a configured connection from the viewpoint of the local communication partner with its properties, for example, between two S7-1200 CPUs.

What you need to know about using connection resources

Introduction

Each connection requires connection resources for the end point and/or transition point on the devices involved. The number of connection resources is device-specific.

If all the connection resources of a communication partner are assigned, no new connections can be established. This situation is apparent when a newly created connection in the connection table has a red background. The configuration is then inconsistent and cannot be compiled.

S7 connections

In the case of S7 connections via the PN interface, one connection resource per S7 connection is assigned for the endpoint for the S7-1200 CPU. One connection resource is also required for the connection partner.

You can find an overview of available and assigned connection resources for selected S7-1200 CPU in the Inspector window at "Properties > Connection Resources"

Views containing information about the configured connections

The views described below will provide you with comprehensive access to all the information and functions regarding configuring and checking communication connections.

- Connection display in the network view
- Connection table
- "Properties" tab for a connection in the inspector window

	Local end po	Local connection name ne	Local ID	Partner ID	Partner	Connection type	One-way	Connectior
1	HMI_1	HMI connection_1			PLC_1	HMI connection	✓	✓

HMI connection: HMI connection_1

General

Connection

Offline status: ✓

Connection path

	Local	Partner
End point:	HMI_1	PLC_1
Scl Interface:	ETHERNET, HMI IE SUBMODULE	CPU 1214C AC/DC/Rls, PROFINE
Subnet:	PN/IE_1	PN/IE_1
Address:	192.168.0.2	192.168.0.1

Find connection path

Benefits

The information shown in these views are always up-to-date in terms of the current user actions. This means:

- The connection table displays all connections created.
- If you have selected a connection in the connection table:
  - When connection mode is enabled, the connection path is highlighted in the network view.
  - The "Properties" tab in the Inspector window displays the parameters of this connection.

The connection table

The connection table offers the following functions:

- List of all connections in the project
- Selection of a connection and display of connections associated with it in the network view (when connection mode is enabled)
- Changing of connection partners
- Display showing status information

"Properties" tab for a connection in the inspector window

The properties dialog has the following meaning:

- Display for connection parameters
- Display of connection path
- Subsequent specification of connections using the "Find connection path" button

Creating a new connection

Creating a connection - alternatives

You have the following options for creating a connection in the network view:

- Graphic connection configuration
- Interactive connection configuration

You'll find the individual steps for this in the following chapters.

Requirement and result

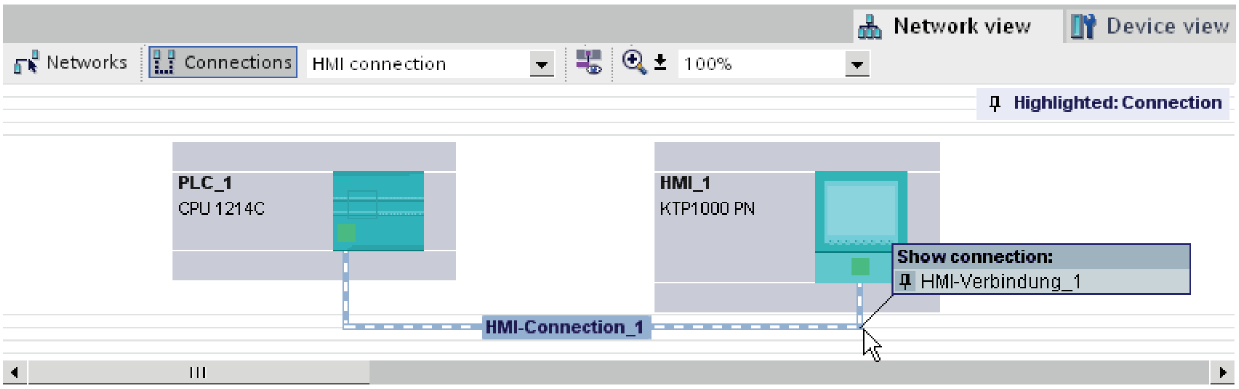
In the network view, you have add devices between which the connections should be configured.

Specifying a connection

If both partners for the connection type selected are networked on the same network, use the graphic or interactive selection of both communication partners to create a fully specified connection.

This connection is entered automatically in the connection table of the S7-1200 CPU. A local connection name is assigned for this connection.

The following schematic shows a configured connection with a networked device:



Creating a new connection graphically

Graphically configuring connections

In the case of graphic connection configuration, the connection path is automatically specified provided interfaces and resources are available. Select the devices to be connected in the current configuration.

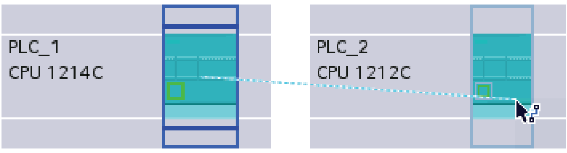
Automatically determining connection path

To create a connection graphically, follow these steps:

1. Click the "Connections" button.

   This step activates the connection mode: You can now select the connection type you want. You will see this from the following:
   The devices that can be used for the connection type selected in your project are color-highlighted in the network view.

2. Hold down the mouse button and drag the mouse pointer from the device from which the connection will originate to the device at which the connection ends.

3. Release the mouse button over the destination device to create the connection between the two devices.

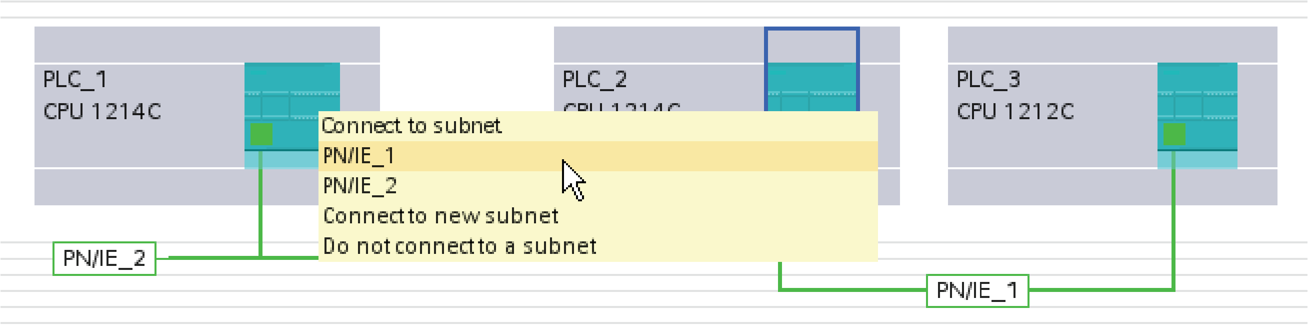
Result

- A specified connection is created.
- The connection path is highlighted.
- The connection is entered in the connection table.

Configuring a connection when there is no or no clear network assignment

Any networking not in place will if possible be created automatically when a connection is created. A query will be made upon completion of connection configuration if unique network assignment is not possible. You will be able to choose from the existing subnets.

Example below: A query is made upon creation of a connection between stations PLC_1 and PLC_2, which are not yet networked.



Interactively creating a new connection

Interactively configuring connections

Define the local device and its connection partners.

Procedure

Proceed as follows to interactively create a connection:

1. Select the "Add new connection" command in the shortcut menu of a connection partner for which you want to create a connection.
   The "Create new connection" dialog appears.
2. Select the partner endpoint.
   In the right pane of the dialog, a possible connection path fitting the selected endpoint is displayed, if available. Incomplete paths, for example, for a non-specified CPU, are marked by an exclamation mark on a red background.
3. To accept the configured connection and to configure additional connections to other endpoints, click "Add".
   To close the dialog, click "OK".

Working in the network view

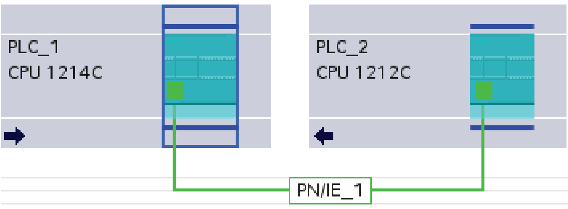
Highlighting connection path and partner in the network view

To display the connection partners for all or certain connection types in the network view, proceed as follows:

1. Click the "Connections" button.

2. Select the S7-CPU for which you want to display the connection partners in the network view and then select the "Highlight connection partners" command in the shortcut menu.
3. Select "All connection partners" in the following menu.

   The local device and the CPUs of the target devices are selected. The local connection partner shows an arrow pointing right and the remote connection partners show an arrow pointing left.
4. To open a list with information on the target devices, click the arrow of the local device. This additional function is useful in complex network configurations in which some devices are not visible.

Note

You can display one of the connection partners which cannot be seen in the current display range of the network view. Click on the communication partner in the list that appears. Result: The display is moved such that the connection partner becomes visible.

Working with the connection table

Basic functions for tables

The connection table supports the following basic functions for editing a table:

- Changing column width
- Displaying the meaning of a column, a row or cell using tooltips.

Changing column width

To adjust the width of a column to the content so that all texts in the lines are legible, follow these steps:

1. Position the cursor in the header of the connection table to the right of the column that you want to optimize until the cursor changes its shape to two parallel lines (as if you wanted to change the width of the column by dragging it with the cursor).
2. Double click on this point.

or

1. Open the shortcut menu on the header of the table.
2. Click on
   – "Optimize column width" or
   – "Optimize width of all columns".

For columns that are too narrow, the complete content of specific fields is shown when you pause with the cursor on the respective field.

Show / hide columns

You can use the shortcut menu of the header of the connection table to control the display of the various table columns. The shortcut menu entry "Show/hide columns" provides you with an overview of the available columns. Use the check box to control whether columns are shown or hidden.

If you want to store the layout, width and visibility of the table columns, click on the "Remember layout" function in the top right-hand of the network view.

Symbol	Meaning
▤	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Using cursor keys to move within the connection table

You can use the UP and DOWN cursor keys to select a connection from the connection table; the selected connection is marked and is shown highlighted in the network view.

Changing properties of connection

You can directly edit some of the parameters displayed in the connection table. The name of the connection can, for example, only be changed in the connection table.

Changing connection partners

You can change the connection partner of a connection as follows:

1. Select the connection.
2. Select the new connection partner from the open drop-down list in the "Partner" column.

Deleting connections

You can delete configured connections via the network view or the connection table.

In the network view you can delete a highlighted connection. In the connection table you can delete one or more connections.

Procedure

To delete a connection, proceed as follows:

1. Select the connection to be deleted:
   - In the network view: Select the connection to be deleted.
   - In the connection table: Select the rows of the connections to be deleted (multiple selection possible).
2. Open the shortcut menu with a right mouse click.
3. Select the "Delete" command.

The selected connection will be completely deleted.

Copying connections

Introduction

Connections are not copied singly but always in context along with the project or the device.

You can copy:

- Entire projects
- One or more devices within a project or from one project to another

Copying a project

When you copy a project all configured connections will also be copied. No settings whatsoever are required for the copied connections because the connections remain consistent.

Copying devices

If you copy devices for which connections have been configured, the connections are copied as well. To complete the connection path, you must still finalize the networking.

An S7-1200 CPU with a V.10 firmware is merely a server for connections and has no connection configuration itself. Consequently, no connections are copied along with it when an S7-1200 CPU with a V1.0 firmware is copied.

Inconsistent connections - connections without assignment

With an inconsistent connection the structure of the connection data is destroyed or the connection is not functional in the project context.

Inconsistent connections cannot be compiled and loaded - operation is not possible with such a connection.

In the connection table inconsistent connections are marked in red.

Possible causes for inconsistent connections

- Deletion or change of the hardware configuration.
- Missing interface network links in the project, which are necessary for a connection.
- Connection resources are exceeded
- Connections to an unspecified connection partner without partner address information.

Detailed information regarding the reasons for the inconsistency can be found in the "Compile" tab following compilation (Edit > Compile).

Remedies

To assign a closed connection path to an existing open connection path, expand the device configuration in such a way that the interfaces required for the connection type are available for both partners. At "Properties > General > Interface" in the Inspector window, you can use the "Find connection path" button to create a connection to an existing partner.

S7 connection - general settings

General connection parameters

General connection parameters are displayed in the "General" parameter group under the properties of the connection; these connection parameters identify the local connection end point.

Here, you can assign the connection path and specify all aspects of the connection partner.

Local ID

The local ID of the module from which the connection is viewed is displayed here (local partner). You can change the local ID. You may need to do this if you have already programmed communication function blocks, and you want to use the local ID specified in those function blocks for the connection.

Special connection properties

Display of connection properties (can be modified depending on the components used):

- One-way

  One-way means that the connection partner functions as a server on this connection and cannot send or receive actively.

- Active connection establishment

  In the case of one-way connection, for example with a S7-1200 CPU (firmware version V1.0), a connection partner can only be provided for the active connection establishment. In the case of a two-way connection you can set which connection partner will assume the active role.

- Sending operating mode messages

  Indicates whether or not the local partner sends operating mode messages to the connection partner.

Address details

Displaying address details of the S7 connection. With an unspecified partner, the values for the rack and slot can be changed. All other values are obtained from the current configuration and cannot be changed.

S7 connection - address details

Meaning

The address details show the end points of the connection and can localize these via the specification of rack and slot.

When a connection is established, the connection-specific resources of a module are assigned specifically to this connection. This assignment requires that the connection resource can be addressed. The TSAP (Transport Service Access Point) is, as it were, the address of the resource that is formed with the help of the connection resource or, in the case of S7-1200 CPUs (firmware V2.0 or higher) with the SIMATIC-ACC (SIMATIC Application Controlled Communication).

Configuration of TSAP for S7-1200

- For S7-1200 CPU (firmare V2.0 or higher):

  "SIMATIC-ACC"<nnn><mm>

  nnn = Local ID

  mm = any value

- For S7-1200 CPU (firmare V1.0):

  <xx>.<yz>

  xx = Number of the connection resource

  y = Rack number

  z = Slot number

TSAP structure, dependent on partner

The configuration of the TSAP for S7-1200 CPUs is dependent on the respective firmware and on the remote connection partner. When a S7-1200 CPU is connected with a S7-300/400 CPU, a S7-1200 CPU also uses a TSAP configuration that includes the connection resource.

See the following examples for TSAPs of various connection configurations

- Connection between two S7-1200 CPUs (both with firmware V2.0):
  - S7-1200 CPU "A" with firmware V2.0 and local ID 100:

    TSAP: SIMATIC-ACC10001
  - S7-1200 CPU "B" with firmware V2.0 and local ID 5AE:

    TSAP: SIMATIC-ACC5AE01
- Connection between two S7-1200 CPUs (firmware V2.0 and V1.0):
  - S7-1200 CPU with firmware V2.0 and local ID 1FF:

    TSAP: SIMATIC-ACC1FF01
  - S7-1200 CPU with firmware V1.0 (rack 0, slot 1, connection resource 03):

    TSAP: 03.01
- Connection between S7-1200 CPUs (firmware V2.0) and S7-300/400 CPU:
  - S7-1200 CPU with firmware V2.0 (rack 0, slot 1, connection resource 12):

    TSAP: 12.01
  - S7-300/400 CPU (rack 0, slot 2, connection resource 11):

    TSAP: 11.02

HMI connection

Introduction to configuring connections

Definition

A connection defines a logical assignment of two communication partners in order to undertake communication services. A connection defines the following:

- Communication partner involved
- Type of connection (e.g., HMI connection)
- Special properties (e.g., whether a connection is established permanently or whether it is established and terminated dynamically in the user program, and whether status messages are to be sent)
- Connection path

What you need to know about connection configuration

During connection configuration, a local connection name is assigned for an HMI connection as a unique local identification.

In the network view, a "Connections" tab is displayed in addition to the "Network overview" tab. This tab contains the connection table. A line in this connection table represents a configured connection, e.g., between an HMI device and PLC, along with its properties.

What you need to know about using connection resources

Introduction

Each connection requires connection resources for the end point and/or transition point on the devices involved. The number of connection resources is device-specific.

If all the connection resources of a communication partner are assigned, no new connections can be established. This situation is apparent when a newly created connection in the connection table has a red background. The configuration is then inconsistent and cannot be compiled.

HMI connections

For HMI connections via the **integrated** PN interface, one connection resource for the endpoint per HMI connection is occupied for the HMI device.

One connection resource is also required for the connection partner (PLC).

Views containing information about the configured connections

The views described below will provide you with comprehensive access to all the information and functions regarding configuring and checking communication connections.

- Connection display in the network view
- Connection table
- "Properties" tab for a connection in the inspector window

	Local end po	Local connection name ne	Local ID	Partner ID	Partner	Connection type	One-way	Connectio
1	HMI_1	HMI connection_1			PLC_1	HMI connection	✓	✓

HMI connection: HMI connection_1

	Local	Partner
End point:	HMI_1	PLC_1
Scl Interface:	ETHERNET, HMI IE SUBMODULE	CPU 1214C AC/DC/Rls, PROFINE
Subnet:	PN/IE_1	PN/IE_1
Address:	192.168.0.2	192.168.0.1

Benefits

The information shown in these views are always up-to-date in terms of the current user actions. This means:

- The connection table displays all connections created.
- If you have selected a connection in the connection table:
  - You will graphically see the connection path in the network view.
  - The "Properties" tab in the Inspector window displays the parameters of this connection.

The connection table

The connection table offers the following functions:

- List of all connections in the project
- Selection of a connection and display of connections associated with it in the network view
- Changing of connection partners
- Display showing status information

"Properties" tab for a connection in the inspector window

The properties dialog has the following meaning:

- Display for connection parameters
- Display of connection path
- Subsequent specification of connections using the "Find connection path" button

Creating a new connection

Creating a connection - alternatives

You have the following options for creating a connection in the network view:

- Graphic connection configuration
- Interactive connection configuration

You'll find the individual steps for this in the following chapters.

Requirement and result

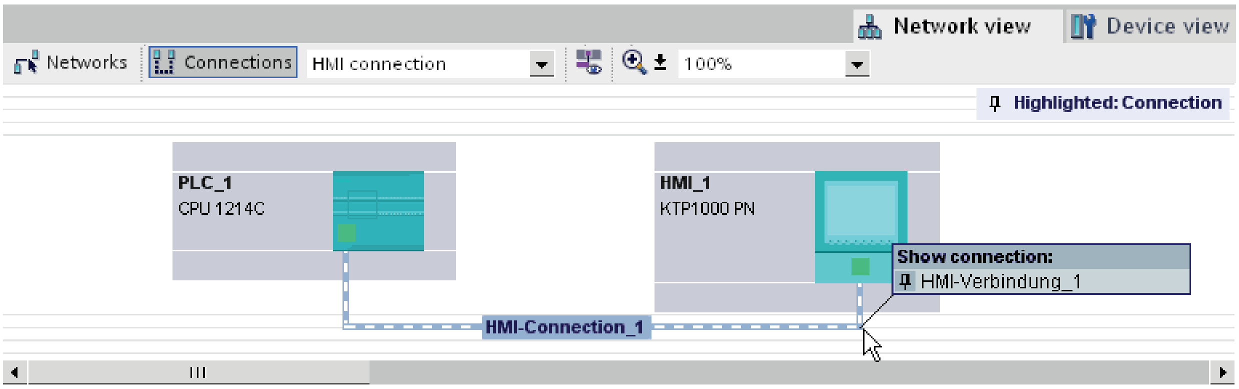
You have created the devices with CPUs and HMI devices between which you want to configure connections in the network view.

Specifying a connection

If both partners for the connection type selected are networked on the same network, use the graphic or interactive selection of both communication partners to create a fully specified connection.

This connection is entered automatically into the connection table of the HMI device. A local connection name is assigned for this connection.

The following schematic shows a configured connection with a networked device:



Creating a new connection graphically

Graphically configuring connections

When using the graphic connection configuration, if necessary the system asks you to define the connection path. Select the devices to be connected in the current configuration.

Automatically determining connection path

To create a connection graphically, follow these steps:

1. Click the "Connections" button.

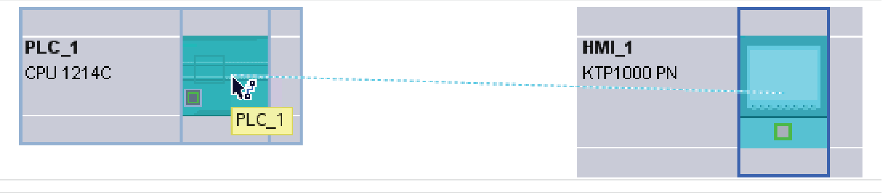
Connections

The connection mode for the connection type you have selected is then activated.

You will see this from the following:

The devices that can be used for the connection type selected in your project are color-highlighted in the network view.

2. Hold down the mouse button and drag the mouse pointer from the device from which the connection will originate to the device at which the connection ends.



3. Release the mouse button over the destination device to create the connection between the two devices.

Result

- A specified connection is created.
- The connection path is highlighted.
- The connection is entered in the connection table.

Interactively creating a new connection

Interactively configuring connections

Define the local device and its connection partners.

Procedure

Proceed as follows to interactively create a connection:

1. Select the "Create new connection" command in the shortcut menu of a connection partner for which you want to create a connection.

   The "Create new connection" dialog is opened.

2. Select the partner endpoint.

   In the right pane of the dialog, a possible connection path fitting the selected endpoint is displayed, if available. Incomplete paths, for example, for a non-specified CPU, are marked by an exclamation mark on a red background.

3. To close the dialog, click "OK".
   To accept the configured connection and to configure additional connections to other endpoints, click "Apply".

Working in the network view

Highlighting connection path and partner in the network view

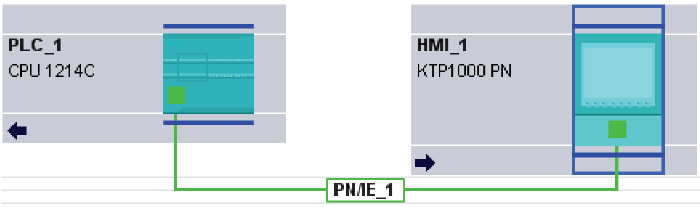
To display the connection partners for all or certain connection types in the network view, proceed as follows:

1. Click the "Connections" button.

   
2. Select the "Highlight connection partners" command in the shortcut menu for the HMI device whose connection partners you want to display in the network view.
3. Select "All connection partners" in the following menu.

   The local device and the CPUs of the target devices are selected. The local connection partner shows an arrow pointing right and the remote connection partners show an arrow pointing left.

4. To open a list with information on the target devices, click the arrow of the local device. This additional function is useful in complex network configurations in which some devices are not visible.



Note

You can display one of the connection partners which cannot be seen in the current display range of the network view. Click on the communication partner in the list that appears. Result: The display is moved such that the connection partner becomes visible.

Creating a new connection graphically (Page 385)

Working with the connection table

Basic functions for tables

The connection table supports the following basic functions for editing a table:

- Changing column width
- Displaying the meaning of a column, a row or cell using tooltips.

Changing column width

To adjust the width of a column to the content so that all texts in the lines are legible, follow these steps:

1. Position the cursor in the header of the connection table to the right of the column that you want to optimize until the cursor changes its shape to two parallel lines (as if you wanted to change the width of the column by dragging it with the cursor).
2. Double click on this point.

or

1. Open the shortcut menu on the header of the table.
2. Click on
   - "Optimize column width" or
   - "Optimize width of all columns".

For columns that are too narrow, the complete content of specific fields is shown when you pause with the cursor on the respective field.

Show / hide columns

You can use the shortcut menu of the header of the connection table to control the display of the various table columns. The shortcut menu entry "Show/hide columns" provides you with an overview of the available columns. Use the check box to control whether columns are shown or hidden.

Using cursor keys to move within the connection table

You can use the UP and DOWN cursor keys to select a connection from the connection table; the selected connection is marked and is shown highlighted in the network view.

Changing properties of connection

You can directly edit the parameters displayed in the connection table in some cases. To change the name of a connection, you do not have to navigate to the Inspector window.

Changing connection partners

You can change the connection partner of a connection as follows:

1. Select the connection.
2. Select the new connection partner from the open drop-down list in the "Partner" column.

Deleting connections

You can delete configured connections via the network view or the connection table.

In the network view you can delete a highlighted connection. In the connection table you can delete one or more connections.

Procedure

To delete a connection, proceed as follows:

1. Select the connection to be deleted:
   - In the network view: Select the connection to be deleted.
   - In the connection table: Select the rows of the connections to be deleted (multiple selection possible).
2. Open the shortcut menu with a right mouse click.
3. Select the "Delete" command.

The selected connection will be completely deleted.

Copying connections

Introduction

Connections are not copied singly but always in context along with the project or the device.

You can copy:

- Entire projects
- One or more devices within a project or from one project to another

Copying a project

When you copy a project all configured connections will also be copied. No settings whatsoever are required for the copied connections because the connections remain consistent.

Copying devices

If you copy devices for which connections have been configured (HMI devices), the connections are copied as well. To complete the connection path, you must still finalize the networking.

An S7-1200 CPU with a V.10 firmware is only a server for connections and has no connection configuration itself. Consequently, no connections are copied along with it when an S7-1200 CPU with a V1.0 firmware is copied.

Inconsistent connections - connections without assignment

With an inconsistent connection the structure of the connection data is destroyed or the connection is not functional in the project context.

Inconsistent connections cannot be compiled and loaded - operation is not possible with such a connection.

In the connection table inconsistent connections are marked in red.

Possible causes for inconsistent connections

- Deletion or change of the hardware configuration.
- Missing interface network links in the project, which are necessary for a connection.
- Connection resources are exceeded
- Errors when backing up data due to insufficient memory
- Connections to an unspecified connection partner without partner address information.

Detailed information regarding the reasons for the inconsistency can be found in the "Compile" tab following compilation (Edit > Compile).

Remedies

If the connection cannot be repaired by opening the connection properties, changing them or undoing them in the configuration, then it may be necessary to delete the connection and re-create it.

HMI connection general settings

General connection parameters

General connection parameters are displayed in the "General" parameter group under the properties of the connection; these connection parameters identify the local connection end point.

Here, you can also assign the connection path and specify all aspects of the connection partner.

Special connection properties

Display of the connection properties (cannot be changed):

- Active connection establishment

  The connection establishment always starts from the HMI device. This option is selected by default if the address of the partner is specified.
- One-way

  One-way means that the connection partner functions as a server on this connection and cannot send or receive actively.
- Sending operating mode messages

  Not relevant for HMI devices.

Address details

Displaying address details of the HMI connection. With an unspecified partner, the values for the rack and slot can be changed. All other values are obtained from the current configuration and cannot be changed.

Miscellaneous

Display of the access points for the online connection between HMI device and connection partner.

Using Open User Communication

Basics of Open User Communication

Introduction

Open User Communication is the name of a program-controlled communications technique for communication via the integrated PN/IE interface of the CPU. Various connection types are available for this communications technique.

The main feature of Open User Communication is its high degree of flexibility in terms of the data structures transferred. This allows open data exchange with any communicating devices providing they support the connection types available here. Since this communication is controlled solely by instructions in the user program, event-driven connection establishment and termination is possible. Connections can also be modified by the user program during runtime.

For S7-1200 CPUs with an integrated PN/IE interface, the TCP, UDP and ISO-on-TCP connection types are available for Open User Communication. The communications partners can be two SIMATIC PLCs or a SIMATIC PLC and a suitable third-party device.

Instructions for Open User Communication

To create the connections, you have various instructions available after opening the program editor in the "Instructions > Extended instructions > Communication" task card:

- Compact instructions for sending or receiving data via integrated functions for establishing and terminating the connection:
  - TSEND_C (connection establishment/termination, sending)
  - TRCV_C (connection establishment/termination, receiving)
- Individual instructions for sending and receiving data or for establishing or terminating connections:
  - TCON (connection establishment)
  - TDISCON (connection termination)
  - TSEND (TCP or ISO-on-TCP: Sending)
  - TRCV (TCP or ISO-on-TCP: Receiving)
  - TUSEND (UDP: Sending)
  - TURCV (UDP: Receiving)

Connection establishment

For Open User Communication, instructions for establishing and terminating the connection must exist for both communications partners. One communications partner sends its data using TSEND, TUSEND or TSEND_C while the other communications partner receives the data using TRCV, TURCV or TRCV_C.

One of the communications partners starts the connection establishment as the active partner. The other communications partner reacts by starting its connection establishment as the passive partner. If both communication partners have initiated their connection establishment, the communication connection is fully established.

Connection parameter assignment

You can assign parameters to establish the connection using a connection description DB with the TCON_Param structure as follows:

- Manually create, assign parameters and write directly to the instruction.
- Supported by connection parameter assignment.

Connection parameter assignment supports the establishment of the connection and should, therefore, be given preference over the other methods.

You specify the following in the connection parameter assignment:

- Connection partner
- Connection type
- Connection ID
- Connection description DB
- Address details according to selected connection type

In addition, you specify here which communication partner activates the connection establishment and which partner establishes a connection passively in response to a request from its communications partner.

Principle of operation of connection-oriented protocols (Page 401)

Overview of connection parameter assignment

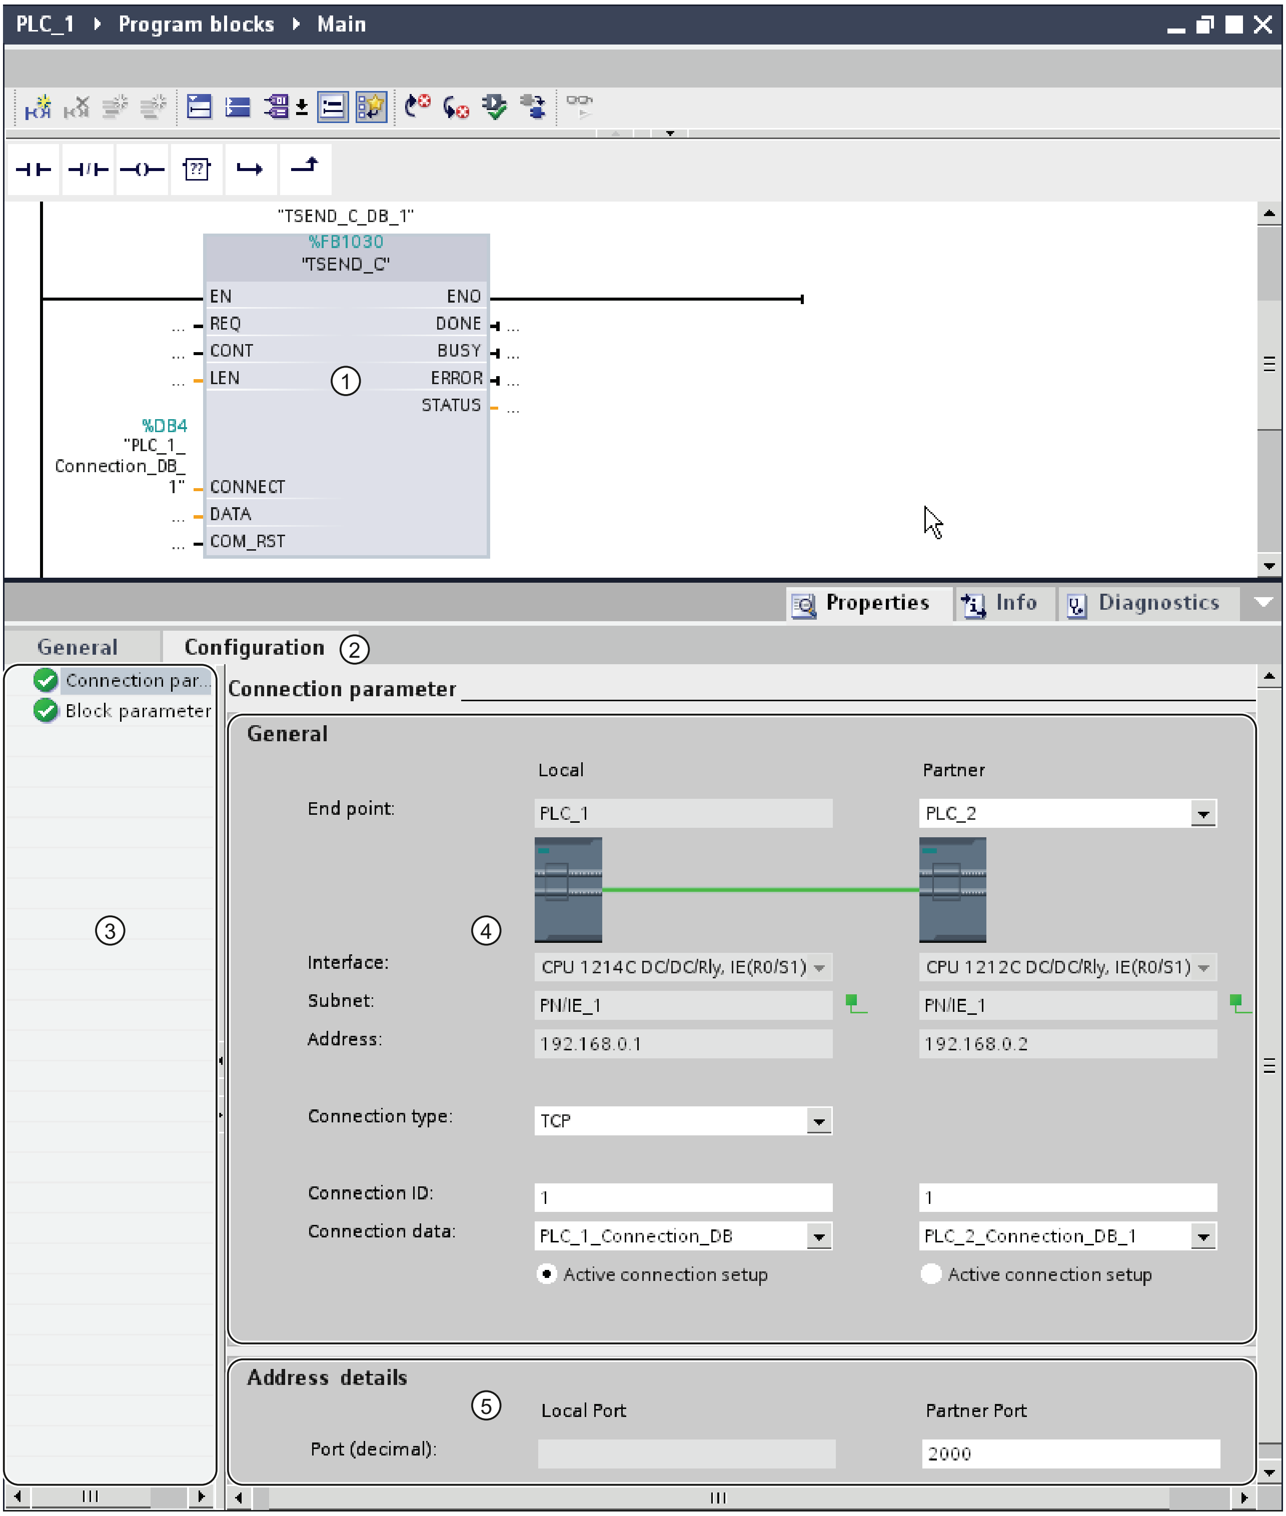
Introduction

You will find the connection configuration in the Inspector window of the program editor if you want to program Open User Communication with the communication instructions TSEND_C, TRCV_C or TCON.

Connection parameter assignment supports the flexible functionality of communications programming: The parameters entered for the connection configuration are stored in an automatically created global DB derived from the structure of the TCON_Param type. You can modify the connection parameters in this connection description DB.

Structure of the connection parameter assignment

The connection parameter assignment is made up of the following components:



Connection parameter

General

	Local	Partner
End point:	PLC_1	PLC_2
Interface:	CPU 1214C DC/DC/Rly, IE(R0/S1)	CPU 1212C DC/DC/Rly, IE(R0/S1)
Subnet:	PN/IE_1	PN/IE_1
Address:	192.168.0.1	192.168.0.2
Connection type:	TCP	
Connection ID:	1	1
Connection data:	PLC_1_Connection_DB	PLC_2_Connection_DB_1
	● Active connection setup	○ Active connection setup

Address details

	Local Port	Partner Port
Port (decimal):		2000

① Communication instruction for TCON, TSEND_C or TRCV_C
② "Configuration" tab in the "Properties" tab
③ Area navigation of the "Configuration" tab
④ General properties of the connection parameters
⑤ Address details of the connection parameters (for selected connection DBs)

"Configuration" tab

Enter the desired connection parameters in the "Configuration" tab. The area navigation of the "Configuration" tab includes the "Connection parameters" group. This group contains the connection parameter assignment. Here, you can enter the parameters for the connections and the address details with system support. Here, you also connect the CONNECT (TCON, TSEND_C, TRCV_C) or ID (TCON, TSEND, TRCV, TUSEND, TURCV) block parameters of the selected communication instructions.

When all the required parameters are assigned, a check mark is set in front of the "Connection parameters" group in the area navigation.

NOTICE
The connection configuration does not check whether the connection IDs and port numbers (TCP, UDP) or TSAPs (ISO-on-TCP) are unique. When you configure Open User Communication, you should, therefore, make sure that the parameter settings are unique within a device.

Parameters of communication connections (Page 403)

Description of the connection parameters

Overview

The following table shows the general connection parameters:

Parameter	Description
End point	The names of the local end point and the partner end point are shown. The local end point is the CPU for which TCON, TSEND_C or TRCV_C is programmed. The local end point is, therefore, always known. The partner end point is selected from the drop-down list. The drop-down list shows all available possible connection partners including unspecified connection partners for devices whose data is unknown in the project. As long as no connection partner is set, all other parameters in the mask are disabled.
Interface	The interface of the local end point is displayed. The partner interface is displayed only after a specified partner end point.
Subnet	The subnet of the local end point is displayed, provided this exists. The partner subnet is displayed only after the partner end point has been selected. If at least one of the two connection partners is not connected with a subnet, the two connection partners are connected with each other. A connection between partners in different subnets is only possible with IP routing. The routing settings can be edited in the relevant interface properties.
Address	The IP address of the local end point is displayed. The IP address of the partner is displayed only after the partner end point has been selected. If you have selected an unspecified connection partner, the input box is empty and has a red background. In this case, you will need to specify a valid IP address.
Connection type	Select the connection type you want to use from the "Connection type" drop-down list: • TCP • ISO-on-TCP • UDP The parameters for the required connection data change depending on the selected connection type.
Connection ID	Enter the connection ID in the input box. You can change the connection ID in the input boxes or enter it directly in TCON. Ensure that the connection ID assigned is unique within the device.
Connection data	The names of the connection description DBs for the connection description structured according to TCON_Param are displayed in the drop-down lists. When you create the connection, one data block each is generated for the specified connection partner and automatically filled with the values from the connection parameter assignment. For the local connection partner, the name of the selected data block is entered automatically in the block parameter CONNECT of the selected TSEND_C, TRCV_C or TCON instruction. For the second connection partner, the connection description DB generated by the first connection partner can also be used directly at the CONNECT input of the TSEND_C, TRCV_C or TCON instructions. With this procedure, you can use the existing connection description DB after selecting the first connection partner or create a new connection description DB. From the drop-down list, you can also reference another valid data block. If a DB is referenced using the CONNECT input parameter of the TSEND_C, TRCV_C or TCON extended instruction and this does not correspond to the structure of a TCON_Param, the drop-down list is shown with no content on a red background.

Parameter	Description
Active connection establishment	Use the "Active connection establishment" check box to specify the active partner of the Open User Communication (only with TCP and ISO-on-TCP).
Port (only with TCP and UDP)	Address component for a TCP or UDP connection. The default after creating a new TCP connection is 2000. You can change the port numbers. The port numbers must be unique on the device!
TSAP (ISO-on-TCP only)	Address component for an ISO-on-TCP connection. The default after creating a new ISO-on-TCP connection is E0.01.49.53.4F.6F.6E.54.43.50.2D.31. You can enter the TSAP-ID with an extension or as an ASCII TSAP. The TSAPs must be unique on the device!

TSAP structure (Page 408)

Examples of TSAP assignment (Page 411)

Ability to read back connection description parameters (Page 407)

Creating and assigning parameters to connections (Page 397)

Starting connection parameter assignment

The connection parameter assignment for Open User Communication is enabled as soon as a TCON, TSEND_C or TRCV_C instruction for communication is selected in a program block.

Requirements

- Your project must contain at least one S7-CPU.
- The program editor is open.
- A network is available.

Procedure

To insert the extended instructions for Open User Communication, proceed as follows:

1. Open the task card, pane and folder "Instructions > Communication > Open User Communication".
2. Drag one of the following instructions to a network:
   - TSEND_C
   - TRCV_C
   - TCON

   The "Call options" dialog opens.
3. Edit the properties of the instance DB in the "Call properties" dialog. You have the following options:
   - Change the default name.
   - Select the "Manual" check box to assign your own number.
4. Click "OK" to complete your entry.

Result

A corresponding instance DB is created for the inserted instruction TSEND_C, TRCV_C or TCON.

With TSEND_C, TRCV_C or TCON selected, you will see the "Configuration" tab under "Properties" in the Inspector window. The "Connection parameters" group in area navigation contains the connection parameter assignment that you can now make.

See also

Creating and assigning parameters to connections (Page 397)

Creating and assigning parameters to connections

In the connection configuration for Open User Communication, you can create and configure connections of the TCP, UDP or ISO-on-TCP type.

Requirement

A CPU exists with a TCON, TSEND_C or TRCV_C communication instruction.

Procedure

To create a connection for Open User Communication, proceed as follows:

1. Select a TCON, TSEND_C or TRCV_C block of Open User Communication in the program editor.
2. Open the "Properties > Configuration" tab in the inspector window.
3. Select the "Connection parameters" group. Until you select a connection partner, only the empty drop-down list for the partner end point is enabled. All other input options are disabled.

   The connection parameters already known are displayed:

   – Name of the local end point

   – Interface of the local end point

   – IP address of the local end point
4. In the drop-down list box of the partner end point, select a connection partner. You can select an unspecified device or a CPU in the project as the communications partner. Certain connection parameters are then entered automatically.

   The following parameters are set:

   – Interface of the partner end point

   – Interface of the partner end point

   – IP address of the partner end point

   If the connection partners are networked, the name of the subnet is displayed.
5. In the "Connection data" drop-down list, select the existing connection description DBs or create new connection description DBs. You can subsequently select different connection description DBs in the relevant "Connection data" drop-down lists or change the name of the connection description DBs to create new data blocks:

   – You can also see the selected data block at the interconnection of the CONNECT input parameter of the selected TCON, TSEND_C or TRCV_C instruction.

   – If you have already specified a connection description DB for the connection partner using the CONNECT parameter of the TCON, TSEND_C or TRCV_C instruction, you can either use this DB or create a new DB.

   – If you edit the name of the displayed data block in the drop-down list, a new data block with the changed name but with the same structure and content is generated and used for the connection.

   – Changed names of a data block must be unique in the context of the communications partner.

   – A connection description DB must have the TCON_Param structure.

   – A data block cannot be selected for an unspecified partner.

Additional values are determined and entered after the selection or creation of connection description DBs. The following is valid for specified connection partners:

- ISO-on-TCP connection type
- Connection ID with default of 1
- Active connection establishment by local partner
- TSAP-ID E0.01.49.53.4F.6F.6E.54.43.50.2D.31

The following is valid for unspecified connection partners:

- TCP connection type
- Partner port 2000

6. Enter a connection ID for the connection partner. No connection ID can be assigned to an unspecified partner.

Note

You must enter a unique value for the connection ID at a known connection partner. The uniqueness of the connection ID will not be checked by the connection parameter settings and there will be no default value entered for the connection ID when you create a new connection.

7. Select the connection type you want from the relevant drop-down list. Default values are set for the address details depending on the connection type. You can choose between the following:
   - TCP (partner port 2000)
   - ISO-on-TCP (TSAP-ID E0.01.49.53.4F.6F.6E.54.43.50.2D.31)
   - UDP (local port 2000)
8. You can edit the input boxes in the address details. Depending on the selected protocol, you can edit the ports (for TCP) or the TSAPs (for ISO-on-TCP).
9. Use the "Active connection establishment" check box to set the connection establishment behavior for TCP and ISO-on-TCP. You can decide which communications partner establishes the connection actively.

Changed values are checked immediately for input errors by the connection parameter assignment and entered in the data block for the connection description.

Note

Open User Communication between two communications partners can only work when the program section for the partner end point has been downloaded to the hardware. To achieve fully functional communication, make sure that you load not only the connection description of the local CPU on the device but also that of the partner CPU as well.

Deleting connections

Introduction

The data of a created connection for Open User Communication is stored in a connection description DB. You can delete the connection by deleting the data block containing the connection description.

Requirement

You have created an Open User Communication connection.

Procedure

To delete a connection, proceed as follows:

1. Select a communications partner for Open User Communication in the project tree.
2. Open the "Program blocks" folder below the selected communications partner.
3. Select the "Delete" command from the shortcut menu of the data block with the connection parameter assignment.

Note

If you are not certain which block to delete, open the extended instruction TCON, TSEND_C or TRCV_C. You will find the name of the data block as the CONNECT input parameter or in the connection parameter assignment as the "Connection data" parameter.

If you only delete the instance DBs of the extended instructions TCON, TSEND_C or TRCV_C, the assigned connections are not deleted as well.

Note

If the connection DB is used by other blocks of the extended instructions, then the corresponding calls, their instance DBs and the combination blocks TSEND_C and TRCV_C are also deleted from the block folder, provided they are not used elsewhere.

This action prevents the program from being inconsistent.

Result

You have deleted the connection.

Note

Insert an extended instruction TCON, TSEND_C or TRCV_C again to reference an existing connection description with the TCON_Param structure via the "Connection data" parameter.

How protocols work

Principle of operation of connection-oriented protocols

Introduction

Connection-oriented protocols establish a logical connection to the communication partner before data transmission is started. After the data transmission is complete, they then terminate the connection, if necessary. In particular, connection-oriented protocols are used for data transmission when reliable, guaranteed delivery is of importance. Several logical connections can exist over one physical line.

Open User Communication supports the following connection types:

- TCP
- ISO-on-TCP
- UDP

For communication partners that do not support an ISO-on-TCP connection, a TCP connection should be used. For these types of communication partners, such as third-party devices or PCs, enter "unspecified" for the partner end point during connection parameter assignment.

Characteristics of TCP

During data transmission via a TCP connection, no information about the length or about the start and end of a message is transmitted. This does not pose a problem during sending because the sender knows the amount of data to be transmitted. However, the receiver has no means of recognizing where one message in the data stream ends and the next one begins. It is therefore recommended that the number bytes to be received (parameter LEN, instruction TRCV/TRCV_C) be assigned the same value as the number of bytes to be sent (parameter LEN, instruction TSEND/TSEND_C).

If the length of the sent data and the length of the expected data do not match, the following will occur:

- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) greater than length of data to be sent (parameter LEN, instruction TSEND/TSEND_C):

  TRCV/TRCV_C copies the received data to the specified receive area (parameter DATA) only after the assigned length is reached. When the assigned length is reached, data of the subsequent job are already being received. As a result, the receive area contains data from two different send jobs. If you do not know the exact length of the first message, you are unable to recognize the end of the first message and the start of the second message.

- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) less than length of data to be sent (parameter LEN, instruction TSEND/TSEND_C):

  TRCV/TRCV_C copies the number of bytes you specified in the LEN parameter to the receive data area (parameter DATA). Then, it sets the NDR status parameter to TRUE (job completed successfully) and assigns RCVD_LEN (amount of data actually received) the value of LEN. With each subsequent call, you receive a further block of the sent data.

Characteristics of ISO-on-TCP

During data transmission via an ISO-on-TCP connection, information regarding the length and the end of a message is also supplied.

If the length of the sent data and the length of the expected data do not match, the following will occur:

- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) greater than length of data to be sent (parameter LEN, instruction TSEND/TSEND_C):

  TRCV/TRCV_C copies all the sent data to the receive data area (parameter DATA). Then, it sets the NDR status parameter to TRUE (job completed successfully) and assigns RCVD_LEN (amount of data actually received) the length of the data sent.

- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) less than length of data to be sent (parameter LEN, instruction TSEND/TSEND_C):

  TRCV/TRCV_C does not copy any data to the receive data area (parameter DATA), but instead supplies the following error information: ERROR=1, STATUS=W#16#8088 (destination buffer too small).

Characteristics of UDP

Information on the length and the end of a message is also supplied during data transmission via a UDP connection.

If the length of the sent data and the length of the expected data do not match, the following will occur:

- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) greater than length of data to be sent (parameter LEN, instruction TUSEND/TSEND_C):

  TURCV/TRCV_C copies all the sent data to the receive data area (DATA parameter). Then, it sets the NDR status parameter to TRUE (job completed successfully) and assigns RCVD_LEN (amount of data actually received) the length of the data sent.

- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) less than length of data to be sent (parameter LEN, instruction TUSEND/TSEND_C):

  TRCV/TRCV_C copies as much data to the receive data area (parameter DATA) as the LEN parameter requests. No further error message is generated. In this case, the user has to call a T_URCV again in order to receive the remaining bytes.

Parameters of communication connections

Data block for connection description

A connection description DB with a structure according to TCON_Param is used to configure the communication connections for TCP, UDP and ISO-on-TCP. The fixed data structure of the TCON_Param contains all the parameters that are needed to establish the connection. The connection description DB is automatically created for a new connection by the connection parameter assignment for Open User Communication when the TSEND_C, TRCV_C or TCON instruction is used.

The CONNECT connection parameter of the instance DBs for TSEND_C, TRCV_C or TCON contains a reference to the utilized data block.

Structure of the connection description according to TCON_Param

Byte	Parameter	Data type	Initial value	Description
0 … 1	block_length	UINT	64	Length: 64 bytes (fixed)
2 … 3	id	CONN_OUC	1	Reference to this connection (range of values: 1 to 4095). You specify the value of this parameter for the TSEND_C, TRCV_C or TCON instruction under ID.
4	connection_type	USINT	17	Connection type: • 17: TCP • 18: ISO-on-TCP • 19: UDP
5	active_est	BOOL	TRUE	Identifier for the type of connection establishment: FALSE always applies to UDP, since data can be sent and received via local ID. The following is valid for TCP and ISO-on-TCP: • FALSE: Passive connection establishment • TRUE: Active connection establishment
6	local_device_id	USINT	1	ID for the local PN/IE interface.
7	local_tsap_id_len	USINT	0	Length of parameter local_tsap_id used, in bytes; possible values: • 0 or 2, if connection type = 17 (TCP) Only the value 0 is permissible for the active side. • 2 to 16, if connection type = 18 (ISO-on-TCP) • 2, if connection type = 19 (UDP)
8	rem_subnet_id_len	USINT	0	This parameter is not used.
9	rem_staddr_len	USINT	4	Length of address of partner end point, in bytes: • 0: unspecified, i.e., parameter rem_staddr is irrelevant. • 4: valid IP address in the parameter Parameter rem_staddr (TCP and ISO-on-TCP only)
10	rem_tsap_id_len	USINT	2	Length of parameter rem_tsap_id used, in bytes; possible values: • 0 or 2, if connection type = 17 (TCP) Only the value 0 is permissible for the passive side. • 2 to 16, if connection type = 18 (ISO-on-TCP) • 0, if connection type = 19 (UDP)
11	next_staddr_len	USINT	0	This parameter is not used.

Byte	Parameter	Data type	Initial value	Description
12 … 27	local_tsap_id	ARRAY [1..16] of BYTE	-	Local address component of connection: • TCP and UDP: local port no. (possible values: 1 to 49151; recommended values: 2000...5000); local_tsap_id[1] = high byte of port no. in hexadecimal notation; local_tsap_id[2] = low byte of port no. in hexadecimal notation; local_tsap_id[3-16] = irrelevant • ISO-on-TCP: local TSAP-ID: local_tsap_id[1] = B#16#E0; local_tsap_id[2] = rack and slot of local end points (bits 0 to 4: Slot number, bits 5 to 7: rack number); local_tsap_id[3-16] = TSAP extension, optional Note: Make sure that every value of local_tsap_id is unique within the CPU.
28 … 33	rem_subnet_id	ARRAY [1..6] of USINT	-	This parameter is not used.
34 … 39	rem_staddr	ARRAY [1..6] of USINT	-	TCP and ISO-on-TCP only: IP address of the partner end point, for example for 192.168.002.003: • rem_staddr[1] = 192 • rem_staddr[2] = 168 • rem_staddr[3] = 002 • rem_staddr[4] = 003 • rem_staddr[5-6]= irrelevant
40 … 55	rem_tsap_id	ARRAY [1..16] of BYTE	-	Partner address component of connection • TCP: partner port no. (possible values: 1 to 49151; recommended values: 2000...5000); rem_tsap_id[1] = high byte of port no. in hexadecimal notation; rem_tsap_id[2] = low byte of port no. in hexadecimal notation; rem_tsap_id[3-16] = irrelevant • ISO-on-TCP: partner TSAP-ID: rem_tsap_id[1] = B#16#E0; rem_tsap_id[2] = rack and slot of partner end point (bits 0 to 4: Slot number, bits 5 to 7: rack number); rem_tsap_id[3-16] = TSAP extension, optional • UDP: This parameter is not used.

Byte	Parameter	Data type	Initial value	Description
56 … 61	next_staddr	ARRAY [1..6] of BYTE	-	This parameter is not used.
62 … 63	spare	WORD	W#16#0000	Reserved.

TSAP structure (Page 408)

Assignment of port numbers (Page 406)

Assignment of port numbers

Introduction

When an Open User Communication is created, the value 2000 is automatically assigned as the port number.

Permissible values for port numbers are 1 to 49151. You can assign any port number within this range. However, because some ports may already be used depending on the system, port numbers within the range from 2000 to 5000 are recommended.

Overview of port numbers

The following table summarizes the system reactions to various port numbers.

Port no.	Description	System reaction
2000 … 5000	Recommended range	No warning, no error message on entry Port number is permitted and accepted
1 … 1999, 5001 … 49151	Can be used, but is outside the recommended range	Warning message on entry Port number is permitted and accepted
20, 21, 25, 80, 102, 135, 161, 34962 … 34964	Can be used conditionally*	
53, 80, 102, 135, 161, 162, 443, 520, 9001, 34962 … 34964	Can be used conditionally**	

* These ports are used by TSEND_C and TRCV_C with the TCP and UDP connection types.

** These ports are blocked depending on the function scope of the utilized S7-1200 CPU. The documentation of the respective CPUs provides the assignment of these ports.

See also

Description of the connection parameters (Page 394)

Creating and assigning parameters to connections (Page 397)

Ability to read back connection description parameters

Changing parameter values in the connection description

The connection description for exactly one connection of the Open User Communication is entered from the connection parameter assignment in the connection description DB.

You can change the parameter values of the connection description DB outside of the connection parameter assignment in the user program. The structure of the connection description cannot be changed.

Connection description DBs containing values you changed subsequently can be read back from the connection parameter assignment. Under "Properties > Configuration > Connection parameters", the Inspector window displays only the connection parameters stored in the connection description DB.

The connection parameter assignment does not support nested entries of connection descriptions in DB types that can only be found via offset referencing (for example, Global-DB).

Ability to read back individual connection parameters

For the "Address" parameter of the communication partner in a TCP or ISO-on-TCP connection, its IP address is displayed from the "rem_staddr" parameter of the connection description.

The following values can also be reloaded from the connection description:

- Connection type
- Local connection ID:
- Active/passive connection establishment (only with UDP)
- Local TSAP (ISO-on-TCP only)
- Partner TSAP (ISO-on-TCP only)
- Local port (only with TCP and UDP)
- Partner port (TCP only)

The values of the connection ID parameters of the communication partner, the connection data, as well as the connection establishment, are not included in the connection description in the local connection description DB. Consequently, these parameters cannot be displayed when the connection parameter assignment is reopened. The connection establishment of the partner results from the local connection establishment and is therefore also displayed.

A new communication partner can be selected at any time in the "Partners" drop-down list box.

When a CPU recognized in the project is selected as a specified communication partner, the entry options for the connection ID and the connection data are shown again.

Parameters of communication connections (Page 403)

Description of the connection parameters (Page 394)

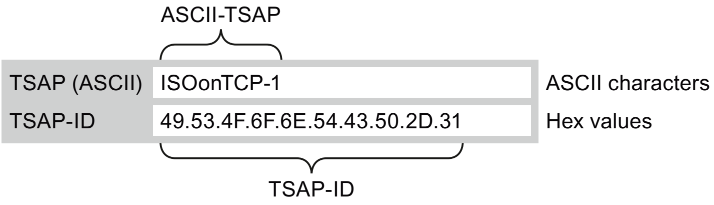
TSAP structure

Introduction

For an ISO-on-TCP connection, Transport Service Access Points (TSAPs) must be assigned for both communication partners. TSAP IDs are assigned automatically after an ISO-on-TCP connection is created. To ensure the uniqueness of TSAP IDs within a device, you can change the preassigned TSAPs in the connection parameter assignment.

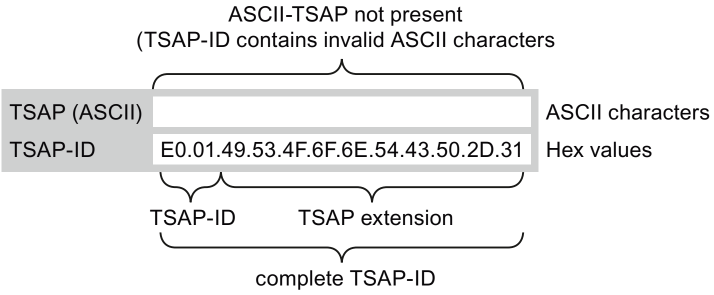
Structure of TSAPs

You must comply with certain rules when assigning TSAPs. A TSAP must contain a certain number of bytes, which are able to be displayed and entered as hexadecimal values (TSAP-ID) or as ASCII characters (ASCII-TSAP):



Entries or changes of the TSAP-ID or the ASCII-TSAP in the corresponding entry fields always take effect in the other display format as well.

If a TSAP contains no valid ASCII characters, the TSAP is displayed only as TSAP-ID and not as ASCII-TSAP. This is the case after a connection is created. The first two hex characters as TSAP-ID identify the communication type and the rack/slot. Because these characters are not valid ASCII characters for a CPU, the ASCII-TSAP is not displayed in this case.



In addition to the rules for length and structure of TSAPs, you must also ensure the uniqueness of the TSAP-ID. The assigned TSAPs are not automatically unique.

Length and content of TSAPs

A TSAP is structured as follows:

- TSAP-ID with TSAP extension

  Length = 2 to 16 bytes

  x_tsap_id[0] = 0xE0 (Open User Communication)

  x_tsap_id[1] (bits 0 to 4) = slot number of CPU

  x_tsap_id[1] (bits 5 to 7) = rack number of CPU

  x_tsap_id[2...15] = any characters (TSAP extension, optional)

  (x = loc (local) or x = rem (partner))

- TSAP-ID as ASCII-TSAP

  Length = 3 to 16 bytes

  x_tsap_id[0 to 2] = 3 ASCII characters (0x20 to 0x7E)

  x_tsap_id[3...15] = any characters (optional)

  (x = loc (local) or x = rem (partner))

The following table shows the schematic structure of a TSAP-ID:

TSAP-ID	tsap_id_len	tsap_id[0]	tsap_id[1]	tsap_id[2..15]	tsap_id[3..15]
...with extension	2...16 bytes	0xE0	0x01 (0x00)*	Extension (optional)	Extension (optional)
...as ASCII-TSAP	3...16 bytes	0x20...0x7E	0x20...0x7E	0x20...0x7	Any (optional)

*A recognized CPU is normally inserted on rack 0 in slot 1. For this reason, hex value 01 is valid for the second place of the TSAP-ID with extension. If the connection partner is an unspecified CPU, for example, a third-party device, the hex value 00 is also permissible for the slot address.

Note

For unspecified communication partners, the local TSAP-ID and the partner TSAP-ID can have a length of 0 to 16 bytes, in which all hex values from 00 to FF are permitted.

ASCII code table for entry of ASCII TSAPs

For entry of an ASCII-TSAP in the connection parameter assignment, only hexadecimal values from 20 to 7E are permitted:

Code	..0	..1	..2	..3	..4	..5	..6	..7	..8	..9	..A	..B	..C	..D	..E	..F
2..		!	"	#	$	%	&	’	(	)	*	+	,	-	.	/
3..	0	1	2	3	4	5	6	7	8	9	:	;	<	=	>	?
4..	@	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O
5..	P	Q	R	S	T	U	V	W	X	Y	Z	[	\	]	^	_
6..	`	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o
7..	p	q	r	s	t	u	v	w	x	y	z	{	|	}	~

Examples of TSAP assignment (Page 411)

Description of the connection parameters (Page 394)

Creating and assigning parameters to connections (Page 397)

Examples of TSAP assignment

The following examples illustrate various aspects of editing TSAPs:

- Example 1: Creating a new connection for PLC-PLC communication
- Example 2: Entry of a local ASCII-TSAP
- Example 3: Entry of a TSAP extension in the TSAP-ID
- Example 4: Incorrect editing of the TSAP-ID
- Example 5: Entry of an ASCII-TSAP via the "TSAP-ID" entry field

Example 1: Creating a new connection for PLC-PLC communication

Once you have created a new connection with two PLCs for the Open User Communication, the TSAP extension "ISOonTCP-1" is assigned automatically.

This TSAP extension produces the TSAP-ID E0.01.49.53.4F.6F.6E.54.43.50.2D.31, which is entered automatically in the connection description DB and in the entry fields of the local and the partner TSAP. The entry fields of the ASCII-TSAPs remain empty:

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	E0.01.49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

You can change the values in the entry fields of the TSAP-ID and the ASCII-TSAP at any time.

The entry field of the TSAP-ID shows the complete TSAP stored in the data block of the connection description. The TSAP-ID with TSAP extension, which is limited to 16 characters, is not displayed in the "TSAP (ASCII)" entry field because the character E0 does not represent a valid character for the ASCII-TSAP.

If the displayed TSAP-ID is a valid ASCII-TSAP, it is displayed in the "TSAP (ASCII)" entry field.

Changes in the entry fields for TSAP-ID and ASCII-TSAP affect the other field.

Example 2: Entry of a local ASCII-TSAP

If you have created a new connection and assigned an ASCII value for the local TSAP in the "TSAP (ASCII)" entry field, for example, "ISOonTCP-1", the resulting TSAP-ID is created automatically.

When you exit the "TSAP (ASCII)" entry field, the number of ASCII characters is checked automatically for compliance with the limit (3 to 16 characters) and the resulting TSAP-ID is entered into the corresponding entry field:

	Local TSAP	Partner TSAP
TSAP (ASCII)	ISOonTCP-1	
TSAP-ID	49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

Example 3: Entry of a TSAP extension in the TSAP-ID

If, following creation of a connection and entry of an ASCII-TSAP (see examples 1 and 2) in the entry field of the local TSAP-ID, you add the prefix "E0.01" to the TSAP value, the ASCII-TSAP will no longer be displayed when the entry field is exited.

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	E0.01.49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

Once you have exited the entry field of the TSAP-ID, a check is performed automatically to determine whether the first character of the TSAP-ID is a valid ASCII character. Since the character "E0" now present in the TSAP-ID is not a valid character for the ASCII-TSAP, the "TSAP (ASCII)" entry field no longer displays an ASCII-TSAP.

If a valid ASCII character is used, the check for compliance with the length specification of 2 to 16 characters follows.

Example 4: Incorrect editing of the TSAP-ID

If you remove the hex value "E0" from a TSAP-ID beginning with "E0.01", the TSAP-ID now begins with "01" and therefore no longer complies with the rules and is invalid:

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	01.49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

After the entry field is exited, a message is output because the TSAP-ID is neither a valid ASCII-TSAP (this would have to have a hex value in the range from 20 to 7E as the first value) or a valid TSAP-ID (this would have to have the identifier "E0" as the first value).

Example 5: Entry of an ASCII-TSAP via the "TSAP-ID" entry field

If you remove the value "01" in addition to the value "E0" from the incorrect TSAP-ID in example 4, the TSAP-ID begins with the hex value 49. This value is within the permissible range for ASCII-TSAPs:

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

When you exit the entry field, the TSAP-ID is recognized as a valid ASCII-TSAP and the resulting ASCII-TSAP "ISOonTCP-1" is written to the "TSAP (ASCII)" entry field.

Description of the connection parameters (Page 394)

8.1.3.3 Displaying and configuring topology

Overview of the topology view

Functions of the topology view

The topology view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Displaying the Ethernet topology
  - Displaying all the PROFINET devices and passive Ethernet components of the project along with their ports
  - Displaying interconnections between the ports
  - Displaying corresponding logical networks
  - Display diagnostic information of all ports
- Configuring the Ethernet topology
  - Creating, modifying and deleting interconnections of the ports
  - Renaming stations, devices, interfaces or ports
  - Adding PROFINET devices and passive Ethernet components to the project from the hardware catalog
- Identifying and minimizing differences between the desired and actual topology
  - Running an offline/online comparison of Ethernet modules, ports and port interconnections
  - Adopting existing online topology information in the offline project

Differences between network view and topology view

- The network view shows all the logical subnets of the project.

  The topology view shows all Ethernet components of the project. These include passive components such as switches, media converters and cables.

  Note

  Stations with non-Ethernet components are also displayed if the station has a least one Ethernet component.

- The position of a device in the network view and its position in the topology view are not dependent on each other; in other words, the same device generally appears at different locations in the two views.
- If you open the hardware catalog in the topology view, you only see devices with an Ethernet interface.

Structure of the topology view

The topology view (Page 313) essentially consists of a graphic area (called the graphic view below) and a table area (called the table view below).

Which functions are there in the graphic view and which functions are there in the table view?

- Displaying the Ethernet topology

Function	Graphic view	Table view
Displaying all the PROFINET devices and passive Ethernet components of the project along with their ports	yes	yes
Display interconnections between the ports (including type of medium)	yes	yes
Displaying corresponding logical networks	no	yes
Displaying properties of the cables between the ports	no	yes
Display diagnostic information of all ports	yes	yes

- Configuring the Ethernet topology

Function	Graphic view	Table view
Creating, modifying and deleting interconnections of the ports	• Create: yes • Modify: no • Delete: yes	• Create: yes • Modify: yes • Delete: yes
Renaming stations, devices, interfaces or ports	no	yes
Adding PROFINET devices and passive Ethernet components to the project from the hardware catalog	yes	no

- Identifying and minimizing differences between the desired and actual topology

Function	Graphic view	Table view
Running an offline/online comparison of Ethernet modules, ports and port interconnections	no	yes
Adopting existing online topology information in the offline project	no	yes

Starting the topology view

Requirement

The device or network view is open in the hardware and network editor.

Procedure

To start the topology view of your project, follow these steps:

1. Click on the "Topology view" tab.

Or:

1. Open the network view of the hardware editor.
2. Select a PROFINET device or a PROFINET module.
3. Select the "Go to topology view" command in the shortcut menu.

Result

The graphic view of the topology view is started. If you opened the topology view using the shortcut menu, the selected component remains selected after the change of view.

Displaying topology

Displaying the graphic view of the configured topology

What is shown?

The graphic view of the configured topology shows the following:

- Configured PROFINET devices and passive Ethernet components along with their ports
- Configured stations with non-Ethernet components if there is at least one Ethernet component in the station
- Configured interconnections between the ports

Type of display

The way in which the graphic view of the topology view and the network view are displayed is very similar:

- Compared with the device view, components are shown in a simplified form.
- The interconnections between ports are shown as horizontal and vertical lines. These are dashed when an interconnection between a tool changer port and its possible partner ports is involved.

Displaying the table view of the configured topology

What is shown?

The table view of the configured topology shows exactly the same content as the graphic view except for the logical PROFINET subnets.

- All the configured PROFINET devices and passive Ethernet components along with their ports
- All the configured stations with non-Ethernet components if there is at least one Ethernet component in the station
- Configured interconnections between the ports

  For each port with the "Alternative partner port" property, there are as many completed rows as there are potential partner ports plus one empty row.

Type of display

As the name implies, the table view of the topology view consists of a table, the topology overview table. It is structured like the network overview table. It consists of the following columns:

- Device / port

  This is the most important column of the table. The entries in this column have a hierarchical structure with the PROFINET ports being the last element in the hierarchy. You can expand and collapse the hierarchical entries. For a CPU, for example, an entry consists of the following elements:

  – Station name

  – Device name

  – Name of the PROFINET interface

  – Names of the ports

  Note: All the other columns only have entries in the rows containing the port names.
- Type (as default, this column is not displayed)

  Shows what type of station, device or interface the table row relates to or whether it belongs to a port.
- Order no. (as default, this column is not displayed)

  Order no. of device
- Subnet (as default, this column is not displayed)

  Configured subnet to which the interface belongs
- Master / IO system (as default, this column is not displayed)

  Shows whether or not the interface belongs to a PROFIBUS DP master system or a PROFINET IO system.
- Device address (as default, this column is not displayed)

  Configured address of the interface in the subnet

- Partner station

  Name of the station that contains the partner port
- Partner device

  Name of the device that contains the partner port
- Partner interface

  Interface to which the partner port belongs
- Partner port
- Cable data

  Contains the cable length and the signal delay of the cable connecting the ports

Basic functions for tables

The topology overview table supports the following basic functions for editing a table:

- Displaying and hiding table columns

  Note: The columns that define the configuration cannot be hidden.
- Optimizing column width
- Displaying the meaning of a column, a row or cell using tooltips.

Displaying the diagnostics status of ports and cables in the graphic view

Requirements

The graphic view of the topology view is open.

Procedure

To determine the diagnostics status of the port, follow these steps:

1. Go online with the required component or components.

Result

The following icons are displayed:

- The corresponding diagnostics icon is displayed for each device.
- If there is an error in at least one lower-level component, the diagnostics icon "Error in lower-level component" is also displayed in the left-hand lower corner of the diagnostics icon.
- The corresponding diagnostics icon is displayed for each port.
- Every cable between two ports that are online has the color that matches its diagnostics status.

You will find the possible diagnostics icons for ports and the color coding of Ethernet cables in the description of hardware diagnostics. See: Determination of online status and display using symbols (Page 649)

Showing the diagnostics status of hardware components in the table view

Requirement

The table view of the topology view is open.

Procedure

To obtain the diagnostics status of hardware components of the topology overview table, follow these steps:

1. Go online with the required components.

Result

The following icons are displayed at the left-hand edge of the topology overview table in each row that belongs to the component involved:

- The diagnostics icon belonging to the hardware component is displayed.
- If the hardware component has lower-level components and if there is an error in at least one of the lower-level components, the diagnostics icon "Error in lower-level component" is also displayed in the left-hand lower corner of the diagnostics icon of the hardware component.

For the possible diagnostics icons for hardware components, refer to the description of hardware diagnostics. See: Determination of online status and display using symbols (Page 649)

Note

The display of the diagnostics status of hardware components in the topology overview table and the network overview table is identical.

Running an offline/online comparison and displaying the results

Requirements

The topology view is open. There may be an online connection to one or more devices, but this is not actually necessary.

Procedure

To find the differences between the configured and the actual topology, follow these steps:

1. Click the "Compare offline/online" button in the toolbar of the topology overview.

Result

The "Partner station", "Partner interface" and "Cable data" columns in the topology overview table are removed.

Two additional groups of columns are added to the right-hand side of the table and these are initially empty:

- On the far right, columns for the topology to be identified online are added.
- Between the columns for the offline and the online topology, the "Status", "Action" and "Description" columns are added to show the result of the offline/online comparison.

> **Note**
>
> As default, the "Description" column is not displayed.

The following buttons are enabled in the toolbar of the table:

Button	Name	Meaning
🔄	Update	The detection of the existing online topology is started again.
⇲	Synchronize	• Adopt the port interconnections identified online in the project (Page 429) • Adopt the devices identified online in the project (Page 429)

After the actual topology has been identified, the added columns are filled. This is discussed in more detail in the following section.

> **Note**
>
> A difference between offline and online view is displayed for that port connected with the PG/PC which is only available online. This is because the PG/PC cannot be configured offline.

Columns for the topology identified online

The following columns are displayed:

- "Device / port"
- "Type" (as default, this column is not displayed)
- "Order no." (as default, this column is not displayed)
- "IP address" (as default, this column is not displayed)
- "Partner device"
- "Partner port"
- "Cable data"

Columns for the result of the offline/online comparison

The following columns are displayed:

- "Status"

  The result of the offline/online comparison is shown here in the form of diagnostics icons. The following icons are possible:

Diagnostics icon	Meaning
❗	Differing topology information in at least one lower-level component
●	Identical topology information
◐	Topology information only available offline or device is disabled.
◑	Topology information only exists online
◖◗	Differing topology information

- "Action"

  The possible actions are shown here in the form of icons. The following icons are possible:

Icon	Meaning
=	No action possible
←	Adopt the interconnection found online

- "Description"

  This column describes the selected action in words.

Configuring topology

Interconnecting ports

Overview

Interconnecting ports in the topology view

In the topology view, you have the following options for interconnecting ports:

- in the graphic view (Page 422)
- in the graphic view of a tool changer (Page 424)
- in the table view (Page 423)
- in the table view of a tool changer (Page 424)
- by adopting port interconnections identified online (Page 429)

What effects does the interconnection of ports have on the network view?

Note

In the properties of a subnet in the network view, you can specify that when a port interconnection is created between two devices that are not networked, this subnet is used.

When you create an interconnection between two ports, the following effects are possible in the network view:

- If the corresponding interfaces are not networked: If you have specified a default subnet, this is used. Otherwise a new subnet is created to connect the two interfaces.
- If one (and only one) of the two interfaces involved is networked: The non-networked interface is connected to the same subnet as the already networked interface.
- In all other cases: The corresponding interfaces are not connected to a logical subnet.

Interconnecting ports in the graphic view

Requirements

You are in the graphic view of the topology view.

Procedure – Creating a new interconnection between two ports

To interconnect a port of a device with a port of another device, follow these steps:

1. Place the mouse cursor on the port you want to interconnect.
2. Click with the left mouse button and hold it down.
3. Move the mouse pointer.

   The pointer now shows the networking symbol to indicate "Interconnect" mode. At the same time, the mouse pointer shows the lock symbol that will only disappear when the pointer is on a valid target.
4. Now drag the mouse cursor to the target port. You can do this while holding down or after releasing the mouse button.
5. Now release the left mouse button or press it again (depending on your previous action).

Result: A new port interconnection is created.

Interconnecting ports in the table view

Which actions are possible with port interconnections in the table view?

The following actions are possible with port interconnections in the table view:

- Create new port interconnection
- Modify existing port interconnection
- Delete existing port interconnection

Requirement

The row with the port whose interconnection you want to create, modify or delete is visible in the topology overview.

Procedure

To create the interconnection of a port for the first time, to modify it or delete it, follow these steps:

1. Move the mouse pointer to the "Partner port" column in the row of the source port.
2. Click on the drop-down list there.
3. Select the required partner port (when creating a new interconnection or changing the port interconnection) or the "Not interconnected" entry (when deleting a port interconnection).

Result

The required action is performed. The new partner port (after creating or modifying a port interconnection) is displayed in the "Partner port" column otherwise the "Select port" entry (after deleting a port interconnection).

Interconnecting a port with more than one partner port in the graphic view

Requirement

- You have assigned parameters to a port of a PROFINET device with the "Alternative partners" property and have specified the possible partner ports.
- The graphic view of the topology view is open.

Procedure

1. Interconnect this port (called source port below) with one of the partner ports you have specified (called target port below).
2. Interconnect the source port with an additional target port.

   You can do this in several ways:

   – Drag the mouse pointer from an already interconnected partner port to a target port.

   – Drag the mouse pointer from an interconnection that has already been created to a target port.

   – Drag the mouse pointer from a target port to an already interconnected partner port.

   – Drag the mouse pointer from a target port to an already created interconnection.
3. If necessary, repeat the step above one or more times.

Result

An interconnection is created between the source port and the alternative partner ports. This is indicated by a dashed line.

Interconnecting a port with more than one partner port in the table view

Which actions are possible with port interconnections to multiple partner ports in the table view?

When working with a tool changer, the following actions can be performed with port interconnections to multiple partner ports in the table view:

- Create new port interconnection
- Modify existing port interconnection
- Delete existing port interconnection

Requirement

- You have assigned parameters to a port of a PROFINET device with the "Alternative partners" property and have specified the possible partner ports.
- The row with the port whose interconnection you want to create, modify or delete is visible in the topology overview.

Procedure

To create the interconnection of a port to one or more partner ports for the first time, to modify it or delete it, follow these steps:

1. Move the mouse pointer to the "Partner port" column in the row of the source port.
2. Click on the drop-down list there.
3. Select the required partner port (when creating a new interconnection or changing the port interconnection) or the "Not interconnected" entry (when deleting a port interconnection).

Result

The required action is performed:

- If you are creating an interconnection, a new row is inserted in the topology overview table. The new partner port is displayed there in the "Partner port" column.
- If you make a change, the new partner port is displayed in the "Partner port" column.
- If you are deleting, the row with the previous port interconnection is deleted.

> **Note**
>
> With a tool changer, there are normally several rows for a port with port interconnections to several partner ports. The last row is always an empty row. The first row can be edited, all other rows are read-only.

Renaming stations, devices, interfaces or ports

Rename a station, a device, an interface or a port

Requirement

The table view of the configured topology is open.

Procedure

To rename a station, a device, an interface or a port, proceed as follows:

1. Click twice in the relevant field of the topology overview table (the second click starts the editing mode).
2. Enter the new name and then press the ENTER key (this closes editing mode).

Result

The object is renamed.

Offline/online comparison

Automatic assignment of devices by offline/online comparison

Overview

During the offline/online comparison, the configured topology is compared with the actual existing topology. Devices identified online are automatically assigned to configured devices as far as this is possible.

Start of availability detection

You start the availability detection the first time by clicking the "Compare offline/online" button in the toolbar of the topology overview.

You restart availability detection by clicking the "Update" button.

Note

The availability detection can take several seconds. During this time, no user input is possible.

Automatic assignment

A device identified online is automatically assigned to a configured device if the following properties of the two devices match up:

- Device name
- Order number
- Number of ports

The following section describes the situations that can occur and what action you can take:

- Identical port interconnections

  This is the ideal situation. No action is necessary here.

"Action" column	Meaning
●○	No action

- There are interconnections for the identified and configured device, there are however differences.

  The following actions are possible:

  – If it is possible to adopt the online configuration

"Action" column	Meaning
◖●	Adopt online interconnection (Page 429)
●●	No action

  – If it is not possible to adopt the configuration

"Action" column	Meaning
●●	No action

- The interconnection only exists online.

  The following actions are possible:

  – If it is possible to adopt the online configuration

"Action" column	Meaning
◐●	Adopt online interconnection (Page 429)
○●	No action

  – If it is not possible to adopt the configuration

"Action" column	Meaning
○●	No action

- The interconnection only exists in the configuration.

  The following actions are possible:

"Action" column	Meaning
◐○	Adopt the online interconnection (Page 429), in other words, the interconnection in the configuration will be deleted
●○	No action

No automatic assignment

In the following situations, no automatic assignment is possible:

- No device can be identified online to match a configured device. In this case the corresponding columns in the "Online topology" area of the topology overview table are empty.

  In this case, you should add the already configured device to your system or delete the configured device from the configuration.

- A device identified online cannot be assigned to any configured device. In this case the corresponding columns in the "Offline topology" area of the topology overview table are empty.

  In this case, you can adopt the device identified online in the project (Page 429).

Adopt the port interconnections identified online in the project

Requirements

You have run an offline/online comparison in the topology view. The result of this is that at least one device identified online was automatically assigned to a configured device, but that there are differences relating to the interconnection.

Procedure

To adopt one more port interconnections identified online in the project manually, follow these steps:

1. Select the value "Adopt" in the "Action" column for a port of a configured device to which a device identified online was assigned.
2. Repeat the step if necessary for other ports of the same configured device.
3. Repeat the steps up to now if necessary for other configured devices to which devices identified online were assigned and for which there are differences relating to the interconnection.
4. Click the "Synchronize" button.

Result

The port interconnections identified online and the cable information for the corresponding devices are adopted in the project. Successful adoption is indicated by the diagnostics icon "Identical topology information" for each port.

Note

If other port interconnections are recognized for a device identified online and these differ from those that exist in the project, adopting these in the project means that the port interconnections that were previously in the project are replaced by those identified online. If no port interconnections are detected for a device identified online, adopting in the project means that all the port interconnections of this device are deleted in the project.

Adopt the devices identified online in the project

Requirements

You have run an offline/online comparison in the topology view. The result of this is that at least one device identified online could not be assigned to any configured device.

Procedure

To adopt one more devices identified online in the project manually, follow these steps:

1. For a configured device without an online partner, move the mouse pointer to the "Device/port" column of the online topology.
2. Select the device you want to assign to the configured device from the drop-down list of this box.
3. Repeat the previous steps if necessary for other configured devices without an online partner.

Result

The selected device that was identified online is moved up from the end of the table. Following this, it is in the row of the configured device to which you have just assigned it.

8.1.4 Creating configurations

8.1.4.1 Configurations for automation systems

Addressing modules

Addressing modules

Introduction

In the device view you see the addresses or address ranges of the modules in the I-address and Q-address columns. There are other addresses as well, which are explained below.

I/O address

I/O addresses are required to read inputs and/or set outputs in the user program.

Input and output addresses are assigned automatically when inserting modules in the rack. The address of the first channel is the start address of a module. The addresses of the other channels are derived from this start address. The address end is derived from the module-specific address length.

Device address (e.g., Ethernet address)

Device addresses are addresses of programmable modules (Industrial Ethernet addresses). They are required to address the different stations of a subnet, e.g. to load a user program into a CPU.

Hardware ID for identification of modules or functional units of modules

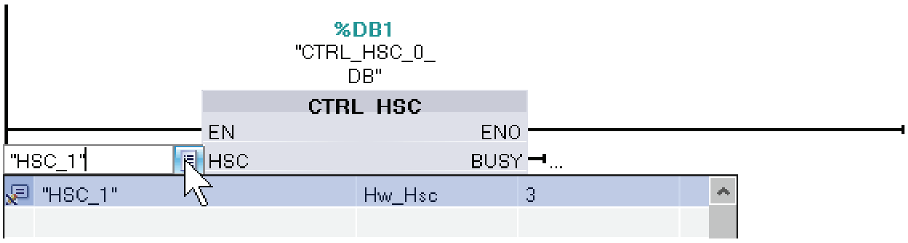
In addition to the I addresses and Q addresses, a hardware identifier is also assigned automatically and is used to identify the module. Functional units of a module, for example an integrated counter, also receive a hardware identifier.

The hardware identifier consists of a whole number and is output by the system along with diagnostics alarms to allow the faulty module or functional unit to be localized.

You also use the hardware identifier for a number of instructions to identify the relevant module on which the instruction will be used.

The hardware ID cannot be changed.

Example: Identifying a high-speed counter



The hardware ID is assigned automatically when components are inserted in the device or network view and in the constants table of the PLC tags. A name is also assigned automatically for the hardware ID. These entries in the constants table of the PLC tags cannot be changed either.

See also

Specifying input and output addresses (Page 431)

Assigning addresses to a location in the program (Page 432)

Introduction to loading a configuration (Page 523)

Specifying input and output addresses

Default input and output addresses are set automatically. You can, however, change the address assignment later.

All addresses of modules are located in the process image area. The process image is automatically updated cyclically.

Requirement

You are in the device view.

Procedure

To change the preset address range proceed as follows:

1. In the device view, click on the module for which you want to set the start address.
2. Go to "I/O addresses" in "Properties" in the inspector window.
3. Under "Start address" enter the required start address.
4. Press <Return> or click on any object to accept a modified value.

If you have entered an invalid address, a message indicating the next available address is displayed.

Note

You can also change the addresses directly in the device overview.

See also

Editing properties and parameters (Page 345)

Assigning addresses to a location in the program

You can assign addresses or symbols from the I/O channels of the modules directly to the locations in the program.

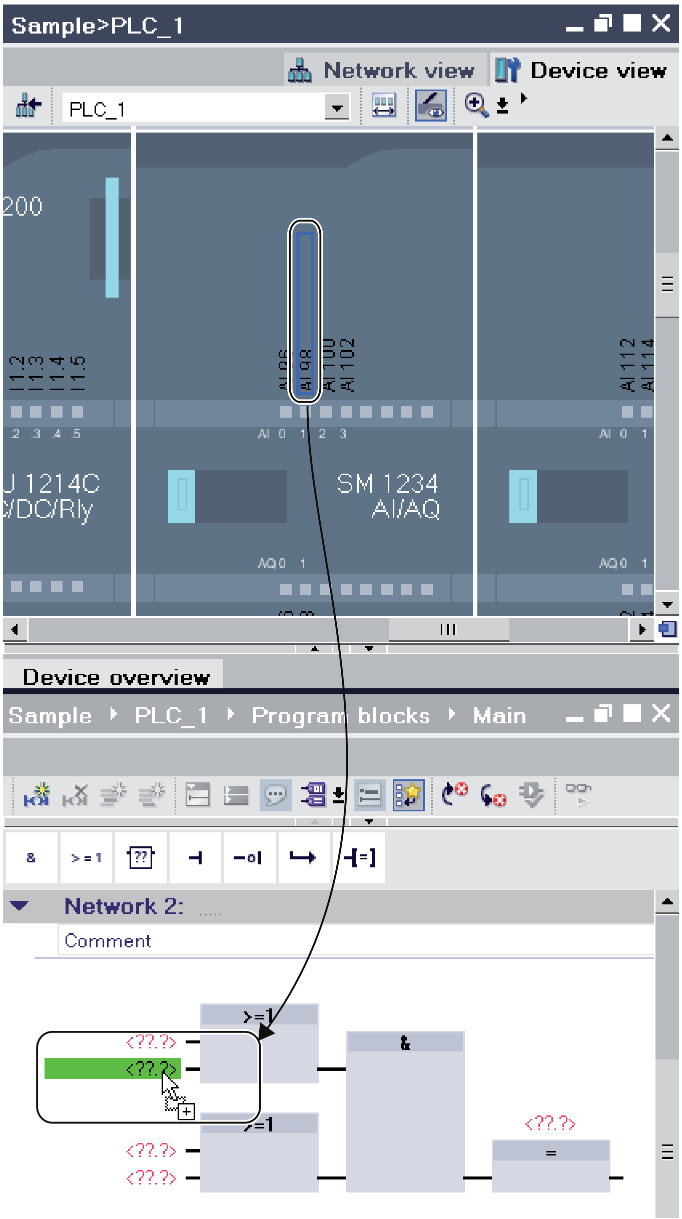
Requirement

The device view of the hardware and network editor as well as the instruction window of the program editor must be opened and arranged one below the other.

Procedure

Proceed as follows to assign addresses of modules and locations in the program:

1. In the device view, navigate to the module with the desired I/O channel.
2. Use the zoom function to specify a magnification of at least 200%: At a magnification level of 200% and higher, the labels of the individual address channels are displayed and can be edited.
3. In the program, navigate to the block with the matching location.
4. Drag the desired address or tag to the appropriate location of the block or the I/O channel of the module.



The module address or tag will be assigned to the location in the program, or the address or tag in the program will be assigned to a module I/O channel.

Signal board

Inserting a signal board in a CPU

Introduction

Signal boards allows you to increase the number of the S7-1200 CPU's own inputs and outputs. Just like all other hardware components, you will find signal boards in the hardware catalog. However, you do not insert signal boards in the rack like other modules but directly in a slot of the CPU itself.

Note the following points when using a signal board:

- Each CPU can have only one signal board inserted in it.
- A signal board can only be inserted when the slot in the CPU is free.

There are various ways of inserting a signal board in a CPU:

- Double click on a signal board in the hardware catalog when there is a free slot in the CPU
- Drag from the hardware catalog to a free slot in the CPU
- Shortcut menu of a signal board in the hardware catalog for copying and pasting

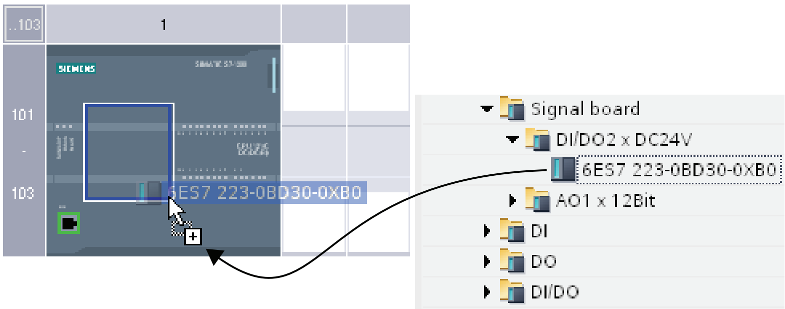
Requirement

- The hardware catalog is open.
- The S7-1200 CPU has a free slot for the signal board.

Inserting a signal board in a CPU

To insert a signal board in a CPU, proceed as follows:

1. Go to the required signal board in the hardware catalog.
2. Select the signal board you want to use.
3. Drag the signal board to the free slot in the CPU.



You have now inserted a signal board in the slot of the CPU.

If you are in the network view, you can also drag a signal board to a device. If the CPU has a an empty slot for a signal board, the signal board is inserted automatically into this slot.

Configurations for Web server

What you need to know about web servers

Introduction

The web server allows you to monitor the CPU via the Internet or the intranet of your company. This permits evaluation and diagnostics over long distances.

Messages and status information are visualized on HTML pages.

Web browser

You need a web browser that supports HTML 1.1 to access the HTML pages of the CPU.

The following web browsers, for example, are suitable for communication with the CPU:

- Internet Explorer (version 6.0 and higher)
- Mozilla Firefox (V1.5 and higher)
- Opera (version 9.0 and higher)
- Netscape Navigator (version 8.1 and higher)

Reading information via the web server

The information listed in the following can be read from the CPU. Availability of the respective web pages depends on the CPU and its firmware version:

Page/information	Description
Intro	Entry page for the standard web pages
Start Page Start page with general CPU information	The start page provides an overview of general information on the CPU, the name of the CPU, the type of CPU and basic information on the current operating state.
Identification Identification information	Displays the static identification information such as serial number, order number and version numbers.
Diagnostic Buffer Diagnostic information	Displays the content of the diagnostics buffer with the most recent entries.
Module Information Module information	Displays whether the centrally inserted components of a station are OK, whether there are maintenance requirements or components cannot be reached, for example.
Communication Communication	Displays the communication connections during open communication (OUC); displays resources and address parameters.
Varable Status Tags	Displays the status of operands of the user program to monitor and change the values.

Page/information	Description
Data Logs	Data logs in CSV format to transfer to the hard disk of the programming device. The data logs are created with data log instructions in the user program and filled with data.
User Pages User pages (if custom web pages have been configured and loaded)	The user web pages provide a list of web pages with customized web applications.

Web access to the CPU via PG/PC

Proceed as follows to access the web server:

1. Connect the client (PG/PC) to the CPU via the PROFINET interface.
2. Open the web browser.

   Enter the IP address of the CPU in the "Address" field of the web browser in the format http://ww.xx.yy.zz (example: http://192.168.3.141).
   The start page of the CPU opens. From the start page you can navigate to further information.

Standard web pages

Requirements for web access

The requirements for access to standard CPU web pages are explained in the following, as well as the effects of missing or existing configuration information.

Requirements

The web server must be started.

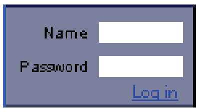
The web server only starts when it has been activated in the properties of the CPU in the "Web server" section.

Note the following:

The web pages are normally transmitted via an non-secure connection and are not secured against hacker attacks. If you want to transfer the web pages in encrypted form to the browser, use the URL https://, followed by the IP address of the CPU.

Logon

No logon is required to access the standard web pages read-only. To execute certain actions, such as changing the operating state of the CPU or for write access, the user must be logged on as "admin". The logon input boxes are on the top left of each standard web page.



If you log on as "admin", you must enter the user name and password there.

Name: admin.

Password: configured CPU password (for password-protected CPU).

JavaScript and cookies

The standard web pages use JavaScript and cookies. You must enable both in your web browser.

If JavaScript is not enabled, the following limitations apply:

- Data from standard web pages are not automatically updated.
- You cannot log on as "admin".
- Fields cannot be sorted (module information)

If cookies are not enabled you cannot log on as "admin".

Access for HTTPS (Page 438)

Settings for operation

Settings for operation

To be able to use the web server of an S7-1200-CPU, you must select the CPU in the network view or the device view and make the following settings in the inspector window under "Properties > General > Web server":

- Enable the web server
- Restricting access to the CPU to HTTPS transmission protocol (encrypted transmission)

  Access via port 80 is then blocked. Communication is only possible via port 443.
- Enabling automatic update of web pages

  The update interval is set by default and cannot be changed. The CPU updates web pages with changing content ((for example, status information or diagnostics information) at regular intervals.

Access for HTTPS

Access via HTTPS

HTTPS is used for encrypting and authentication of communication between the browser and web server.

To transfer data between the browser and the CPU using the HTTPS protocol, enter the URL as https://ww.xx.yy.zz in the address line of your browser, whereby ww.xx.yy.zz stands for the IP address of the CPU.

You require a valid, installed certificate for error-free HTTPS access to the CPU.

If no certificate is installed a warning is displayed with a recommendation not to use this page. To view the page you must explicitly "Add exception".

You can receive a valid certificate (Certification Authority) "SIMATIC CONTROLLER" as a download from the "Intro" web page under "Download certificate". The help function for your respective web browser provides information on how to install a certificate.

Accessing data logs

The "Data logs" web page allows files to be viewed or downloaded that have been created using DataLog instructions and that have been filled with data. You can clear or delete these entries after downloading by logging on as "admin".

Opening a data log

To open a data log, click on the link of the desired data log. You can then open the file (.csv), for example, in Microsoft Excel or in another program you choose or you can save the file.

Special feature: Data logs are saved in U.S. American CSV format. You can only open the file directly using the U.S. version of Microsoft Excel. If you are using another national version of Microsoft Excel, you must import the file, selecting "comma" in the import assistant as the delimiter.

Downloading a data log

To download a data log, click on the download icon of the desired data log. You can then open the file (.csv), for example, in Microsoft Excel or in another program you choose or you can save the file.

Downloading and clearing or deleting a data log

To download and delete the current entries of the data log, you must be logged on as "admin". To do this, click on the "Download and delete" icon of the required data log. You can then open the file (.csv), for example, in Microsoft Excel or in another program you choose or you can save the file. The web server delete the content of the file. The file itself is not deleted, only its content. New data can then be written in this file.

Determining the amount of content

As a default, the 25 most-used entries are displayed, irrespective of how many entries are contained in the data log. The number of displayed entries can be set.

Creating and loading custom web pages

What you need to know about custom web pages

Concept

The concept of custom web pages allows you to access freely-designed web pages of the CPU from a web browser. The web server of the CPU provides this function.

You are not dependent on special tools for the design and functionality of the custom web pages. You can adapt the pages in the layout with CSS, provide dynamic content with JavaScript or use any framework to produce web pages.

The totality of files processed by the web server is also referred to as the "web application".

Web application and user program

Using HTML code in user-defined web pages, you can also transmit data via a web browser to the user program of the CPU for further processing and can display data from the operand area of the CPU in the web browser.

You can use script instructions (such as Javascript) to optimize your web pages, for example to dynamically change contents or validate user entries.

To synchronize between the user program and the web server, but also to initialize, you must call the WWW (SFC 99) instruction in the user program.

- If no interaction is required between the web application and the user program, for example, if a web page only provides static information, only initialization in the user program is required.
- If a simple data exchange is necessary between PLC tags and tags in web applications, to display the contents of PLC tags or write a value in a PLC tag for example, the syntax for reading and writing tags has to be observed. In this case only an initialization is required in the user program, for example in the startup OB.
- If a further interaction is required between the web application and the user program, you must handle status and control information from the Web Control DB in addition to the synchronization between Web server and user program. This is the case, for example, when user entries are transmitted via the web browser to the web server for evaluation by the CPU. Unlike simple data exchange, the user program directly influences the time at which the requested web page is relayed back to the web browser. In this case, you must be acquainted with the concept of manual fragments and the structure of the Web Control DB.

Initialization

Custom web pages are "packaged" in data blocks for processing by the CPU. You must generate appropriate data blocks from the source data (HTML files, images, JavaScript files, etc.) during configuration to be able to download the web application into the CPU. The Web Control DB has a special role (default: DB 333). It contains status and control information as well as links to additional data blocks with coded web pages. Data blocks that contain coded web pages are termed "Fragment DBs".

When the data block is downloaded into the CPU, the CPU does not "know" that custom web pages are coded inside it. The "WWW" (SFC 99) instruction, for example, in the Startup OB informs the CPU which DB is the Web Control DB. The custom web pages can be accessed via a web browser after this initialization.

Synchronization

If the user program is to exchange data with the user-defined web pages, the WWW (SFC 99) instruction must be used in the cyclic program section.

Examples of interaction between user program and web page:

- Check received data
- Assemble and send back data to the web browser making the request

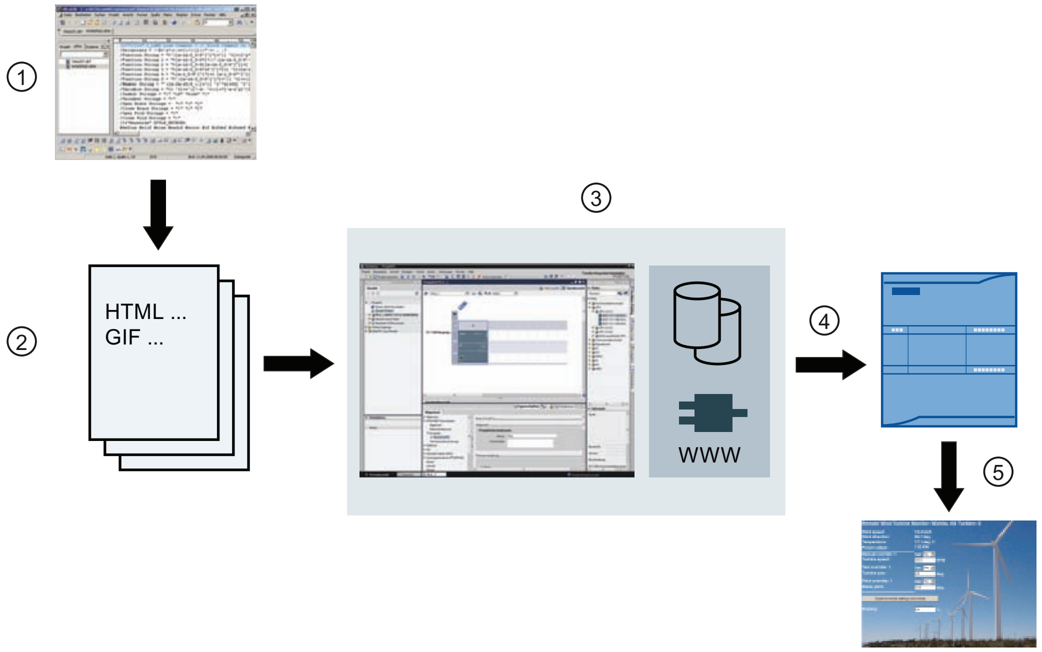
In this case, the status information must be able to be evaluated and control information must be transmitted to the web server, for example, to release a requested web page.

Procedural overview

Basic considerations

This section provides a step-by-step explanation of the basic procedure used to create and download custom web pages and to use them in the operating phase.

The following graphic provides a simplified representation of the process used in creating and displaying custom web pages:



① Programming a web application (using suitable tools when required and AWP commands for dynamic pages when applicable).

② The web application is comprised of single source files, for example, *.html, *.gif, *.js, etc.

③ Using STEP 7:

- Generate the data blocks (Web Control DB and fragment DBs) from source files. The DBs contain meta information and the complete web application, including the images and the dynamic and static parts of the web application. The DBs are stored under "System blocks" in the project tree.
- Call the "WWW" instruction in the user program. This instruction initializes the web server of the CPU for a web application.
- If required, complete final programming for interaction between the web server and user program

④ Downloading the blocks to the CPU.

⑤ Call the web page in the browser. The web pages of the CPU are called by entering the IP address of the CPU.

Additional information

You can find additional information and examples relating to the S7-1200 web server on the Internet (http://support.automation.siemens.com/WW/view/en/36932465).

Creating web pages

Web design tools from various companies can be used to create custom web pages. As a rule, the web pages should be programmed and designed compliant to the conventions of the W3C (World Wide Web Consortium). No check is made for compliance to W3C criteria in the web server of the CPU.

Rules

- The tool must be able to directly edit the HTML code so that the AWP command can be inserted into the HTML page.

  Only the AWP commands are parsed in the CPU and, for example, replaced by values from the user program/process image of the CPU.
- Files containing AWP commands must be coded in UTF-8. In the metadata of the HTML page, therefore, set the attribute charset to UTF-8 and save the file UTF-8 coded.
- Files containing AWP commands must not contain the following sequence:]]>
- Files containing AWP commands must not contain the following sequence outside of the "Tag-read ranges" (:=<Tag name>:): :=

  Tip: Replace the first character of a prohibited sequence with its character coding; for the colon, for example, &#58;.

A small example for a custom web page should make clear the basic design.

Requirements

- The CPU must have a web server and the web server of the CPU must be activated.
- To be able to access PLC tags with write access as a user, you must be logged on as "admin".
- For the example below, PLC tags must be defined for those PLC tags that are to be shown on the web page. This is shown here for the first tab used, "Tank_below_max".

		Name	Data type	Address
1		Tank_below_max	Bool	%I0.0

Creating custom web pages

The following code for an example web page reads values from the process image and provides them in a table.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01//EN"
"http://www.w3.org/TR/html4/strict.dtd">
<html>
  <head>
   <meta http-equiv="Content-Type" content="text/html; charset=utf-
8">
   <title>Mix</title>
  </head>
   <body>
    <h1>Mix</h1>
    <h2> Actual State </h2>
    <table border="1">
     <tr>
      <th>Variable</th>
      <th>State</th>
     </tr>
     <tr>
      <td>Tank below max</td>
      <td>:="Tank_below_max":</td>
     </tr>
     <tr>
      <td>Tank above min</td>
      <td>:="Tank_above_min":</td>
     </tr>
    </table>
   </body>
</html>
```

AWP commands

The interface between a freely-programmable web application for a CPU that has a web server and the CPU data is declared by the AWP command (Automation Web Programming).

To develop web applications you are only subject to the restrictions of the web browser. In one of the programming languages of STEP 7, control with the user program which CPU data is displayed at what time in the web browser of the viewer. Use AWP commands, which you comment within the HTML files, to declare data to be used for intentional interaction between the web application and the user program.

AWP commands are inserted as HTML comments with a special syntax into HTML files; they declare the following features:

- Read PLC tags
- Write PLC tag
- Read special tags
- Write special tags
- Define enum types
- Assign tags to enum types
- Defining fragments
- Import fragments

Syntax of AWP commands

An AWP command begins with "`<!--AWP_`" and ends with "`-->`". In JavaScript files, the commands should also be enclosed by JavaScript comments ("`/*...*/`").

Notation rules for PLC tag names within an AWP command

The AWP commands "AWP_In_Variable" and "AWP_Out_Variable" contain a name attribute and optionally a use attribute. A PLC tag name is assigned to these attributes, by means of which the PLC tags in the browser are written or read. The following rules apply to handling PLC tag names in HTML code:

- PLC tags must be enclosed in quotation marks (" ... ").
- PLC tags used in AWP commands must also be enclosed by single quotation marks ("' ... '") or with quotation marks masked by a backslash ("\" ... \"").
- If the PLC tag name contains the character \ (backslash), this character must be designated with the escape sequence \\ as standard character of the PLC tag name.
- If the PLC tag name in the AWP command is also enclosed by single quotation marks and the single quotation mark (') occurs within the name, it must also be designed as normal character by the escape sequence \'.
- If an absolute address (input, output, bit memory) is used in AWP command, it is enclosed by single quotation marks.

PLC tag	**PLC tag in HTML code**
`"Velocity"`	`<!-- AWP_In_Variable Name='"Velocity"' -->`
	`<!-- AWP_In_Variable Name="\"Velocity\"" -->`
`"abc\de"`	`<!-- AWP_In_Variable Name='"abc\\de"' -->`
`"abc'de"`	`<!-- AWP_In_Variable Name='"abc\'de"' -->`
`"abc'de"`	`<!-- AWP_In_Variable Name="abcde" Use'"abc\'de"' -->`
`"DB name".tag`	`<!-- AWP_In_Variable Name='"DB name".tag' -->`
`"DB name"."ta.g"`	`<!-- AWP_In_Variable Name='"DB name"."ta.g"' -->`
`-`	`<!-- AWP_Out_Variable Name=’flag1’ Use='M0.0' -->`

See also

Reading tags (Page 445)

Writing tags (Page 447)

Special tags (Page 448)

Reading tags

Custom web pages can read PLC tags.

The PLC tag must be specified by a PLC tag name.

These OUT variables (direction of output as viewed from the controller) are inserted at any location within the HTML text with the syntax described in the following.

Syntax

`:=<varname>:`

These references are replaced when the web server is in operation by the current values of the PLC tag in each case.

`<varname>` can be a simple, global CPU tag but also a complete tag path to a structure element.

Notation rules for PLC tag names

- PLC tags in HTML code are enclosed by quotation marks ("), if they are defined in the tag table. In the case of data block tags, the name of the data block is enclosed by quotation marks. If special characters are used in the structure elements of the data block, for example the dot (.) or blank, this part must also be enclosed by quotation marks.
- Quotation marks are not used for absolute addresses of inputs, outputs or bit memories.

PLC tag	PLC tag in HTML code
"DB_name".var_name	:="DB_name".var_name:
"DB_name".struct_name.var_name	:="DB_name".struct_name.var_name:
"DB_name"."var.name"	:="DB_name"."var.name":
"memory"	:="memory":
-	:=I0.0:
	:=Q0.0:
	:=MW100:
	:=%MW100:
"My_Data_Block".flag1	<!-- AWP _Out_Variable Name=’flag1’ Use='"My_Data_Block".flag1' -->
	...
	:=flag1:

- If the PLC tag name contains the character : (colon) or \ (backslash), this character must be designated with the escape sequence \: or \\ as standard character of the PLC tag name.

PLC tag	PLC tag in HTML code
"abc:de"	:="abc\:de":
"abc\de"	:="abc\\de":

- Special characters "<, &, >"

  Display problems can occur if these characters are contained in the tag name (for example, "a<b").

  Avoid expressions such as :="a<b": in the HTML page.

  To prevent display problems from occurring, use e.g. an AWP command with a use expression according to the pattern depicted below. The use attribute defines the PLC tag with the problematic character, the name attribute defines the name without problematic character, as it is used in the HTML page.

PLC tag	PLC tag in HTML code
"a<b"	<!—AWP _Out_Variable Name=’simplename’ Use='"a<b"' -->
	...
	:=simplename:

See also

AWP commands (Page 444)

Writing tags

Custom web pages can write data into the CPU.

This requires an AWP command that identifies the PLC tag to be written.

The PLC tag must also be specified by a PLC tag name.

The IN tags (direction of input as viewed from the controller) are placed on the browser page. This can be done, for example, in a form.

The tags are either set in the HTTP header (by cookie or POST method) or in the URL (GET method) by the browser and are then written by the web server into the respective PLC tag.

Syntax

To allow the IN tags to be written to the CPU, the tags must first be defined by an explicit AWP instruction:

```
<!-- AWP_In_Variable Name='<PLC_Varname1>' Name='<PLC_Varname2>'
Name='<PLC_Varname3>' -->
```

Several tags can be defined in an instruction - such as that shown above.

The specific PLC tag name is hereby written in double quotation marks; for example <PLC_Varname1> = "myVar".

In cases where the name of the tag that you use for the web application is not identical to the name of the PLC tag, the "Use" parameter can be used to assign to a PLC tag.

```
<!-- AWP_In_Variable Name=’<Webapp_Varname>’ Use=’<PLC_Varname>’
```

Example

The "AWP_In_Variable" AWP command is indispensable when handling forms.

```
<form method='post' action='/awp/appl/x.html'>
 <p>
  <input name='"var1"' type='text'>
  <input value='set' name='Button1' type='submit'>
 </p>
</form>
```

In the form defined above, the HTTP request method "post" is used to transfer the tag "var1" to the web server. The user places the "var1" tag in the form field. The tag 'Button1' has the value 'set', but is not required for the CPU. To allow the "var1" tag to be written to the CPU, the following instruction must be included in the same fragment:

```
<!-- AWP_In_Variable Name='"var1"' -->
```

Since PLC tags are enclosed in double quotation marks ("), the name in the AWP command must be enclosed in single quotation marks (') or in masked quotation marks (\"). To avoid the numerous escape sequences, we recommend the use of single quotation marks.

```
<!-- AWP_In_Variable Name=’"Info".par1’ -->
<!-- AWP_In_Variable Name="\"Info".par1\"" -->
```

Conditions for write access during operation

The following requirements have to be met in order for a user to be able to write to PLC tags from a user-defined web page.

- The CPU is is password protected.
- The user is logged in as "admin".

This rules applies to all writing access to web pages on a CPU.

See also

Requirements for web access (Page 436)

AWP commands (Page 444)

Special tags

Special tags are mainly HTTP tags set in the definition of the World Wide Web Consortium (W3C) . Special tags are also used for cookies and server tags.

The AWP command to read and write special tags differ only in that they have additional parameters than the AWP command used to read and write normal tags.

Reading a special tag

The Web server can read PLC tags and transfer these to special tags in the HTTP Response Header. You can, for example, read a URL for a diversion to another web page and transfer to the special tag HEADER:Location using the special tag HEADER:Location.

The following special tags can be read:

Name	Description
COOKIE_VALUE:name	Value of cookie with name: "name"
COOKIE_EXPIRES:name	Execution time of cookie with name: "name" in seconds (must be set beforehand).
HEADER:Status	HTTP status code (if no other value has been set, status code 302 is returned).
HEADER:Location	Path for forwarding to another page. Status code 302 must be set.
HEADER:Retry-After	Anticipated time in which the service is not available. Status code 503 must be set.
HEADER: …	All other header tags can also be forwarded in this way.

Use the AWP command "AWP_Out_Variable" to specify which PLC tags are to be transferred in the HTTP header to the web browser.

Basic structure:

```
<!-- AWP_Out_Variable Name="<Typ>:<Name>" [Use="<Varname>"] -->
```

Parameter description

- Name: Type and name of special tag
- Use (optional parameter): In cases where the name of the special tag is not identical to the name of the PLC tag, parameter "Use" can be used to assign to a PLC tag.

Example:

```
<!-- AWP_Out_Variable Name="COOKIE_VALUE:siemens" Use='"info".language' --
>
```

Writing a special tag

In principle, all HTTP tags written in the HTTP header by the web browser can be evaluated by the user program of the CPU. Examples of tag types:

Name	Description
HEADER:Accept-Language	Accepted or preferred language
HEADER:Authorization	Proof of authorization for a requested resource
HEADER:Host	Host and port of the requested resource
HEADER:User-Agent	Information on the browser
HEADER: …	All other header tags can also be forwarded in this way
SERVER:current_user_id	Indicates whether a user is logged on (current_user_id=0: no user logged on)
SERVER:current_user_name	User name of the user logged on
SERVER:GET	Request method is GET
SERVER:POST	Request method is POST
COOKIE_VALUE:name	Value of cookie with name: "name"

The AWP command "AWP_In_Variable" is used to define which special tags are to be evaluated in the user program of the CPU.

Basic structure:

```
<!-- AWP_In_Variable Name="<Typ>:<Name>" [Use="<Varname>"] -->
```

Parameter description:

Name: Type and name of special tag

Use (optional parameter): In cases where the name of the special tag is not identical to the name of the PLC tag, the parameter Use can be used to assign to a PLC tag.

Examples:

```
<!-- AWP_In_Variable Name="COOKIE_VALUE:siemens" Use='"info".language' -->
```

The tag name in the HTTP header is replaced by the PLC tag name specified by Use . The cookie is written to the PLC tag "info".language .

```
<!-- AWP_In_Variable Name='COOKIE_VALUE:siemens' Use='"info".language' -->
```

The tag name in the HTTP header is replaced by the PLC tag name specified by Use. The cookie is written to the PLC tag "info".language .

```
<!-- AWP_In_Variable Name='"COOKIE_VALUE:siemens"' -->
```

The HTTP-header variable is written in the same-name PLC variable.

AWP commands (Page 444)

Enumeration types

Enumeration types (enums)

Numerical values from the PLC program can be converted into text and vice versa using enums. The numerical values can also be assigned for several languages.

Creating enums

Enter an AWP command using the following syntax at the start of the HTML file:

```
<!-- AWP_Enum_Def Name="<Name of the enum type>"
Values='0:"<Text_1>", 1:"<Text_2>", ... , x:"<Text_x>"' -->
```

For example, for German values to be saved as an HTML file in the "de" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"an", 1:"aus", 2:"Störung"' -->
```

For example, for English values, to be saved as an HTML file in the "en" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"on", 1:"off", 2:"error"' -->
```

Assigning enums

Tags are assigned from the user program to the individual enum texts using a special AWP command:

```
<!-- AWP_Enum_Ref Name="<VarName>" Enum="<EnumTypeName>" -->
```

<VarName> is thereby the symbolic name from the user program and <EnumTypeName> is the previously set name of the enum type.

Note

In each fragment in which enum texts are referenced by a PLC tag, this PLC tag must be assigned by the appropriate AWP command of the enum type name.

Example

Enum type "state" is defined with values "0" and "1". "0" means "off", "1" means "on":

```
<!-- AWP_Enum_Def Name="state" Values='0:"off", 1:"on"' -->
```

The following code is contained in the HTML code of the web page to be output:

```
<!-- AWP_Enum_Ref Name="operating state" Enum="state" -->
:=operating state:
```

Depending on the value of the "operating state" tag, the ´result displayed is no longer "0" or "1", but "off" or "on".

Definition of fragments

Fragments

Fragments are "logical sections" of a web page to be processed by the CPU individually.

Fragments are usually complete pages but can also be individual elements such as files (for example, images) or complete documents.

Defining fragments

```
<!-- AWP_Start_Fragment Name="<Name>" [Type="<Type>"] [ID="<Id>"] -->
```

The start of a fragment is specified by this command. A fragment runs to the start of the next fragment or to the end of the file.

- <Name> Indicates the name of the fragment.

  The name must start with a letter [a-zA-Z] or an underscore (_). Letters, underscores or numbers [0-9] can follow after this first character.
- <Type> Indicates the type of the fragment.
  - "manual" The user program is informed of the request for a fragment; the web page to be returned can be changed by the user program.
  - "automatic" The page is automatically processed (default).
- <id> A numeric ID can be stipulated for the fragment. If no ID is assigned, the fragment is automatically assigned an ID. For manual pages (<Type>=manual) , the fragment can be addressed in the user program of the CPU by this ID.

Note

Keep the ID low because the highest ID influences the size of the Web Control DB.

The input document is completely divided into fragments by the "AWP_Start_Fragment" command. "AWP_End_Fragment" is therefore unnecessary.

Without a start fragment command, a file is mapped as a fragment; the fragment name is derived from the file name. If a file is divided into several fragments (by "AWP_Start_Fragment"), the file must begin with the "AWP_Start_Fragment" command.

Importing fragments

You can declare a fragment in an HTML page and import this fragment into other web pages.

Example

A company logo is to be displayed on all web pages of a web application.

There is only one instance of the HTML code for the fragment that displays the company logo. You can import the fragment as often and into as many HTML files as required.

Syntax

```
<!-- AWP_Import_Fragment Name = "<name>"-->
```

- <name> is the name of the fragment to be imported.

Example

HTML code within a web page that declares a fragment:

```
<!-- AWP_Start_Fragment Name = "My_Company_Logo"-->
<p><img src = "compay_logo.jpg"></p>
```

Example

HTML code within another web page that imports the declared fragment:

```
<!-- AWP_Import_Fragment Name = "My_Company_Logo"-->
```

Creating and loading a data block

Requirement

- All source files required for the web application have been created.

Procedure

To create data blocks from the source files for custom web pages in STEP 7, proceed as follows:

1. Select the CPU, for example, in the device configuration.
2. Select the properties for custom web pages in the inspector window under "Properties > General > Web server".
3. As "HTML source", select the folder that contains the source files for the web application.
4. Enter the HTMP page to be opened on starting the web application as the start HTML page.
5. Enter a name for the application if required.
6. You can supplement a range of file name extensions as "Files with dynamic content" if necessary. Only enter those file name extensions that also contain AWP commands.
7. The number for the Web Control DB and for the fragment DB start number can be kept as long as they are not already being used by your user program.

8. Click on the "Generate" button to create DBs from the source files.

   The generated data blocks are saved in the project navigation in the "System block" folder (in the "Web server" subfolder).

9. In the CPU, select the network view to be loaded and then select the "Download to device" command in the "Online" menu to download the blocks. Compilation of the blocks is implicitly initiated before downloading.

   If errors are reported during this process, you must correct these errors before you can download the configuration.

Structure of the PLC program

Your user program must call the " WWW" instruction to even allow the web application, for example, the custom web pages, to be available to the CPU on the standard web pages and to allow them to be called up there.

The Web Control DB you have created from the source files is the input parameter (CTRL_DB) for the "WWW" instruction. The Web Control DB references the content of the custom web pages coded in the fragment DB and then receives status and control information.

Calling the "WWW" instruction in the startup program

If you do not want the user program to influence requested web pages, it is sufficient to only call the "WWW" instruction once in a startup OB. This instruction initializes communication between the web server and the CPU.

Calling the "WWW" instruction in the cyclic program

The "WWW" instruction can also be called in an OB processed in cycles (for example, OB 1). This has the advantage of being able to respond to web server requests from within the user program. Manual fragments must be used for this.

In this case, you must evaluate information from the Web Control DB in order to identify the requested web page or the requested fragment. On the other hand, you must set a bit in the user program in order to explicitly release the web page to be returned by the web server after processing the web page request.

The structure of the Web Control DB is described in the following section.

Web Control DB

The Web Control DB (DB 333 by default) is created by STEP 7 and contains information on the structure of user pages, the status of communication and any errors that occur.

Additional fragment DBs are also created as well as the Web Control DB. These fragment DBs (there may also only be one fragment DB) are referenced in the Web Control DB. The fragment DBs contain the web pages and media data coded in fragments, for example, images. The content of the fragment DB cannot be changed by the user program. It is created automatically and is only for data management.

The status and control tags of the Web Control DB are accessed via symbols.

The following lists the tags of the Web Control DB required for status evaluation and to control interaction.

The Web Control DB provides two types of information:

- Global status information: Not bound to a concrete web page request.
- Request status and control information: Information about queued requests.

Global status information

"WEB-Control_DB".commandstate.init	Activates and initializes the web application.
"WEB-Control_DB".commandstate.deactivate	Deactivates the web application.
"WEB-Control_DB".commandstate.inititializing	The web application is initialized (read Web Control DB, etc.).
"WEB-Control_DB".commandstate.error	Web application could not be initialized. The reason is coded in "WEB-Control_DB".commandstate.last_error .
"WEB-Control_DB".commandstate.deactivating	The web application is closed.
"WEB-Control_DB".commandstate.initialized	The web application has been initialized and is ready.
"WEB-Control_DB".commandstate.last_error	Refer to the next table for a value table of possible errors.

Last_error	Description
1	Fragment DB is inconsistent (does not match the Web Control DB).
2	A web application already exists with this name.
3	Memory problem initializing in the web server.
4	Inconsistent data in the Web Control DB.
5	A fragment DB is not available (not loaded).
6	No AWP ID for a fragment DB.
7	The enum fragment is not available (contains the texts and information on the enum types).
8	An action requested via the command flag in the Web Control DB is prohibited in the current state.

Last_error	Description
9	Web application is not initialized (if there is no reinitializing after disabling).
10	Web server is disabled.
...	Last_error is reset once the web application has been successfully initialized.

Request status information

Request status information is bound to one of four possible requests, x = [1 … 4].

"WEB-Control_DB".requesttab[x].idle	Nothing need be done.
"WEB-Control_DB".requesttab[x].waiting	The user program must react to a request from a manual fragment and explicitly initiate further processing in the web browser.
"WEB-Control_DB".requesttab[x].sending	The web server is occupied with processing the request/fragment.
"WEB-Control_DB".requesttab[x].aborting	The TCP connection is closed by the web server.

Request control information

Request control information is bound to one of four possible requests, x = [1 … 4].

"WEB-Control_DB".requesttab[x].continue	Releases the fragment being processed for transmission. Processing of the next fragment is initiated.
"WEB-Control_DB".requesttab[x].repeat	Releases the fragment being processed for transmission. The fragment is then processed again.
"WEB-Control_DB".requesttab[x].abort	Closes the TCP connection.
"WEB-Control_DB".requesttab[x].finish	Releases the fragment being processed for transmission. Stops further processing of requests (terminates the request).

Example:

The tag for the DB is: "WEB-Control_DB". Whether errors have occurred during initialization of the web application can be determined by requesting bit "WEB-Control_DB".commandstate.error in the user program.

If an error has occurred you can analyze it using the "WEB-Control_DB".commandstate.last_error value.

Interaction with the user program

Using manual fragments ensures that the user program reacts synchronously to the user program, thereby allowing the responding web page to be processed by the user program.

Fragment type

To react to the received data in the user program the "manual" fragment type must be used for the fragment writing the data (for "manual pages"):

```
<!-- AWP_Start_Fragment Name="testfrag" ID="1" Type="manual" -->
```

The values are always transferred to the web server of the CPU for automatic and manual pages in the same way:

Example:

```
<form method="POST" action="">
<p>
<input type="submit" value="Set new value">
<input type="text" name='"Velocity"' size="20">
</p>
</form>
```

User program for manual fragments

When using manual pages, the "WWW" instruction must be called in cycles in the user program of the CPU.

To react to values entered in the browser, the request - which is made by the manual page to the web server - must first be evaluated in the user program. To do this, the Web Control DB (for example, DB 333) must be examined in cycles for queued requests. The array that manages four requests is contained in the "requesttab" section of the Web Control DB. Each element of the array thereby contains information on the respective request within a structure.

A simple programming example shows how queued requests are checked based on the tags of the Web Control DB.

"req_index"

In cases where a request has been made, this program section writes the fragment ID in the #frag_index tag and the request no. (value range 1-4) in the #req_index tag.

Using the information from this, the information transferred in the request can now be processed separately for each fragment ID in the program (for example, plausibility check).

Once processing of the request has been completed by the program, the request must be answered and the appropriate entry is once more reset under"requesttab" of the Web Control DB (for example, DB 333).

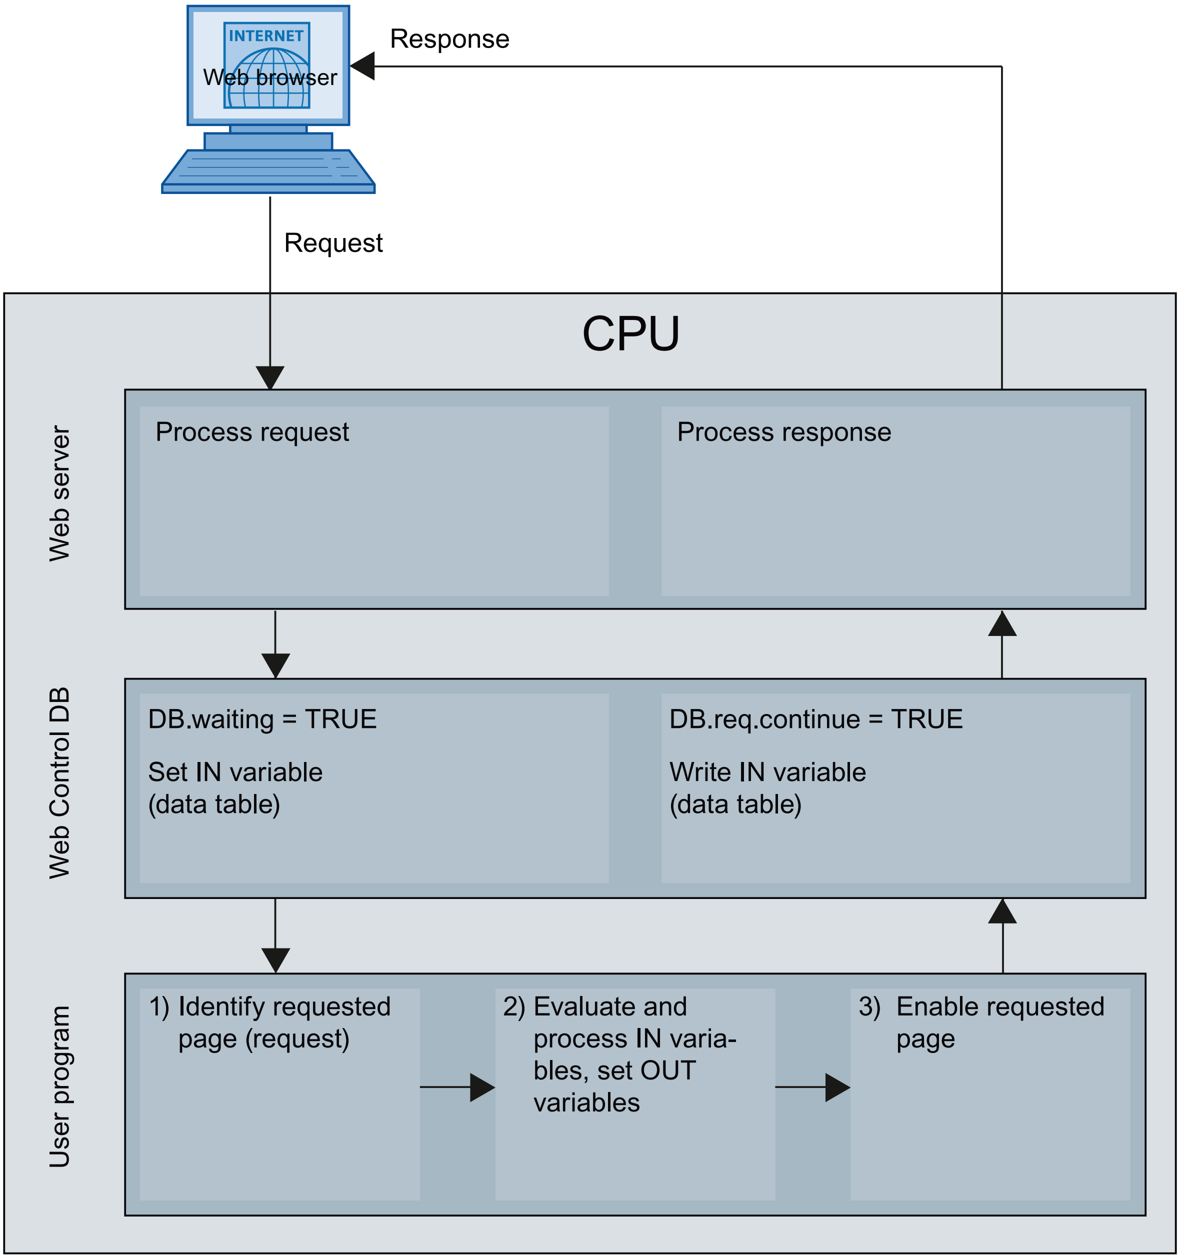
Principle sequence of a browser request with interaction from the user program

The following figure shows the simplified, principle sequence of the web browser request on the effects of Web Control DB content and the actions required from the user program until the processed web page is returned (response).



Displaying custom web pages in the browser

Display web pages in browser

Web pages are called from the standard web pages of the web browser.

In addition to the other links in the navigation bar, the standard web pages also have a link to "user pages".

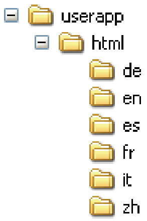
Click on the "user pages" link to open the web browser you have configured as the default HTML page.

Creating custom web pages in several languages

You can make each of your custom web pages available in various languages.

Requirements

The language-dependent HTML; pages must be stored in a folder structure containing folders with the respective language abbreviations:



Specified language abbreviations

Language abbreviations "de", "en", "fr", "es", "it" and "zh" are fixed. Additional language folders or other designated language folders are not supported.

Additional folders within the same folder hierarchy for other files can be created as required; for example, an "img" folder for images and a "script" folder for JavaScript files.

Language switching for custom web pages

Requirements

The HTML pages are contained in the predefined language folders, for example, HTML pages with German text are in the "de" folder, HTML pages with English text are in the "en" folder.

Language switching concept

Language switching is based on a predefined cookie named "siemens_automation_language". If the cookie is set to value "de", at the next web page request or web page update, the web server switches to the web page from the "de" folder.

Similarly, the web server switches to the web page from the "en" folder when the cookie is set to "en".

Example of language switching

The example is structured as follows:

- The language-dependent HTML files with the same name, for example, "langswitch.html" are located in both language folders "de" and "en". The text to be displayed within the two files are German or English, corresponding to the name of the folder.
- There is an additional "script" folder in the folder structure containing the JavaScript file "lang.js". Functions required for language switching are stored in this file .

Structure of the "langswitch.html" file ("de" folder)

Meta data "content language", charset and path to JavaScript file are set in the file header.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN">
<html>
<head>
<meta http-equiv="Content-Language" content="de">
<meta http-equiv="Content-Type" content="text/html; charset=utf-8">
<title>Switch language to German page</title>
<script type="text/javascript" src="script/lang.js" ></script>
<head>
```

Language selection is implemented in the body of the file by the "select" HTML element. The select element initiates a list box and contains the "de" option, labeled as "German" and "en", labeled as "English"; "de" is the default.

The "DoLocalLanguageChange(this)" function is called using the "onchange" event handler. The "this" parameter transmits the select object with the selected option to this function. "onchange" calls the function each time the option is changed.

```
<!-- Language Selection -->
<table>
    <tr>
        <td align="right" valign="top" nowrap>
          <!-- change language immediately on change of the
selection -->
          <select name="Language"
onchange="DoLocalLanguageChange(this)" size="1">
                <option value="de" selected >Deutsch</option>
                <option value="en" >English</option>
            </select>
        </td>
     </tr>
</table>
<!-- Language Selection End-->
```

Structure of the "langswitch.html" file ("en" folder)

The header of the HTML file with English text is structured similarly to the HTML file with German text.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN">
<html>
<head>
<meta http-equiv="Content-Language" content="en">
<meta http-equiv="Content-Type" content="text/html; charset=utf-8">
<title>Language switching english page</title>
<script type="text/javascript" src="script/lang.js" ></script>
```

Language selection is also implemented in the body of the file by the "select" HTML element. In contrast to the German HTML file, the English option is already selected as a default and the test or the labels are in English.

```
<!-- Language Selection -->
<table>
    <tr>
        <td align="right" valign="top" nowrap>
          <!-- change language immediately on change of the
selection -->
          <select name="Language"
onchange="DoLocalLanguageChange(this)" size="1">
                <option value="de" >German</option>
                <option value="en" selected >English</option>
            </select>
        </td>
     </tr>
</table>
<!-- Language Selection End-->
```

Structure of "lang.js" file (in the "script" folder)

The "DoLocalLanguageChange" function is defined in the JavaScript file; this in turn calls the "SetLangCookie" function with the value of the language selection. SetLangCookie combines the cookie name and the cookie value and then sets the cookie using the appropriate document.cookie property. The web page must then be reloaded (top.window.location.reload) to allow the web server to react to the setting of the cookie by displaying the required language.

```
function DoLocalLanguageChange(oSelect) {
        SetLangCookie(oSelect.value);
        top.window.location.reload();
    }

 function SetLangCookie(value) {
        var strval = "siemens_automation_language=";
            // this is the cookie by which the web server
            // detects the desired language
            // this name is required by the web server
        strval = strval + value;
        strval = strval + "; path=/ ;";
            // set path to the application, since otherwise
            // path would be set to the requesting page
```

```
              // would not get the cookie.
              // The path for user defined applications follows this
sample:
              // path=/awp/<application name>/<pagename>
              // example: path=/awp/myapp/myappstartpage.htm
              //(where myapp is the name of the web application
              // entered in the web server properties of the cpu)
              /*
              use expiration if this cookie should live longer
              than the current browser session
              var now      = new Date();
              var endttime = new Date(now.getTime() + expiration);
              strval = strval + "; expires=" + endttime.toGMTString()
+ ";";
              */
          document.cookie = strval;
      }
```

Additional configurations

Configuring additional functions

The S7-1200 automation system has numerous additional functions that are useful as integrated CPU functions or available via plug-in modules (for example, communication modules). You can find the description via the following links.

Overview of point-to-point communication (Page 560)

General information on high-speed counters (Page 556)

8.1.4.2 Configurations for PROFIBUS DP

The basics of configuring a DP master system

Distributed I/O

DP master systems that consist of a DP master and DP slaves which are connected via a bus and communicate with one another via the PROFIBUS DP protocol are referred to as distributed I/O.

Firmware version of the S7-1200 CPU

Use of the PROFIBUS functions with the S7-1200, requires CPUs with firmware version 2.0 or higher.

Configuring distributed I/O

Since DP masters and DP slaves are different devices, these instructions only provide a basic configuration procedure. However, the process for configuring distributed I/O is practically identical to that of non-distributed configuration.

Creating the DP master system in the network view

After you have used dragged a DP master and a DP slave (for example, a CM 1243-5 and a CM 1243-5) from the hardware catalog to the network view, connect them both to a PROFIBUS subnet.

Additional information

Observe additional information on the scope of functions in the manuals of the respective device.

DP slaves within the hardware catalog

DP slaves within the hardware catalog

You will find the DP slaves in the "Distributed I/O" folder of the hardware catalog. Compact and modular DP slaves are located there:

- Compact DP slaves
  Modules with integrated digital/analog inputs and outputs, for example, ET 200L
- Modular DP slaves
  (Interface modules with S7 modules assigned, for example, ET 200M

The available DP master and the desired functionality will determine which DP slaves can be used.

I slaves within the hardware catalog

The CM 1242-5 is, for example, an DP slave that can be configured as intelligent DP slave. You can find it in the hardware catalog at:

- CM 1242-5
  "PLC > SIMATIC S7 1200 > Communication module > PROFIBUS"

DP/DP coupler in the hardware catalog

Introduction

A DP/DP coupler connects two PROFIBUS DP networks as a gateway so that the DP master from one network can transfer data to the DP master of the other network.

The maximum amount of data that can be transferred is 244 bytes input data and 244 bytes output data.

DP/DP coupler in the hardware catalog

Details of a DP/DP coupler as gateway between two DM master systems are contained in the hardware catalog in the folder "Other field devices > PROFIBUS-DP > Gateways".

Configuring the DP/DP coupler

DP/DP couplers are configured in both PROFIBUS networks, each in their own master systems.

The input and output areas of both networks must thereby be matched to one another. The output data from one end of the DP/DP coupler are accepted as input data at the other respective end and vice versa.

Configurations involving PROFIBUS DP

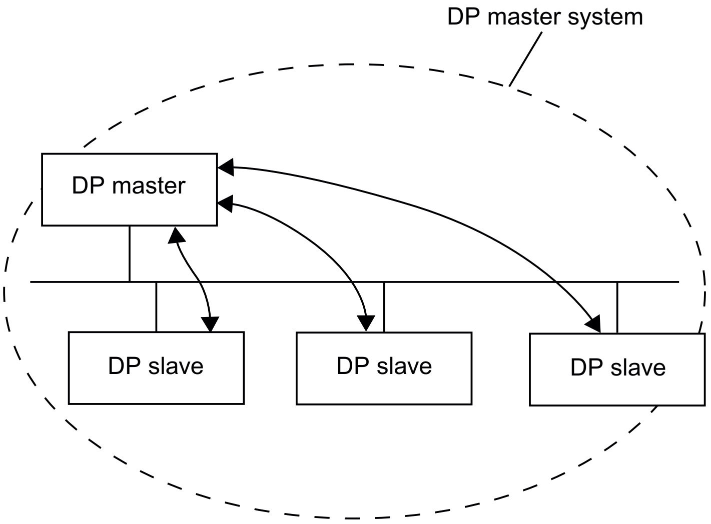
Configurations involving basic DP slaves

Communication between DP master and DP slave

In the case of a configuration involving simple DP slaves, data is exchanged between the DP master and simple DP slaves, i.e. with I/O modules via the DP master. The DP master polls each of the configured DP slaves in its polling list within the DP master system in succession, sending the output data to the slaves and receiving the input data back from the slaves.

Mono-master system

The configuration with only one DP master is also described as mono-master system. A single DP master with its associated DP slaves is connected to a physical PROFIBUS DP subnet.



Configurations involving intelligent DP slaves

Definition

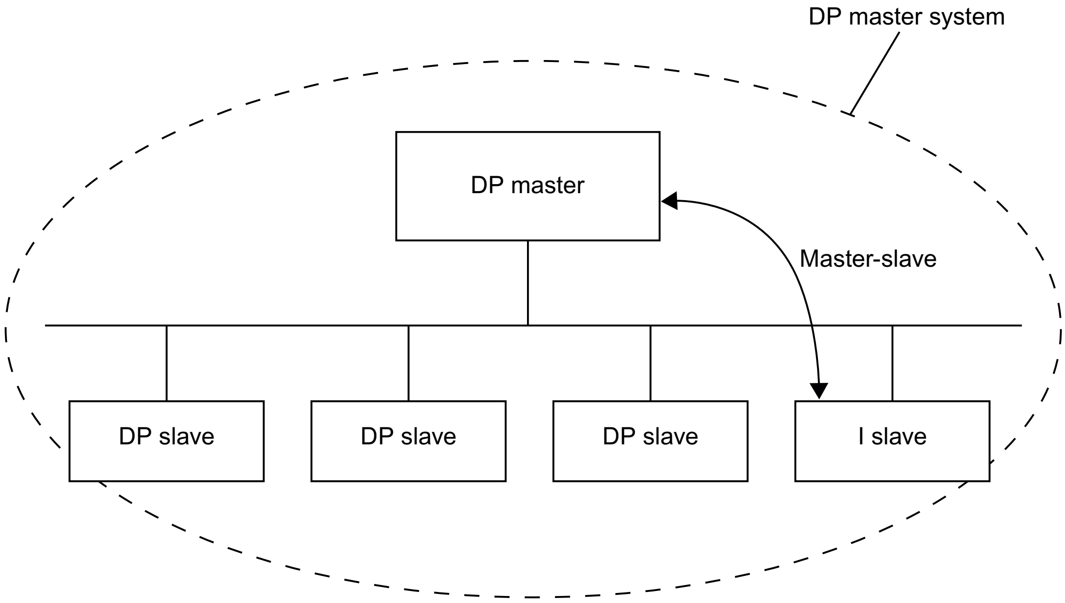
DP slaves that feature their own preprocessing program are referred to as intelligent DP slaves (I slaves).

CM 1242-5 is an intelligent DP slave.

I slave <> DP master data exchange

A higher-level automation system processes the automation task, which is broken down into sub-tasks. The necessary control tasks are processed separately and efficiently in a CPU as preprocessing programs.

In the case of configurations involving intelligent DP slaves, the DP master only accesses the address area of the I slave CPU, and not the I/O modules of the intelligent DP slave. The address area must not be assigned to any actual I/O modules on the I slave. The assignment must be made during I slave configuration.



Configuring distributed I/O systems

Hint: Quick configuration of master systems

If the DP master system has several DP slaves, use drag-and-drop operation to assign to the master in one step all DP slaves that were placed.

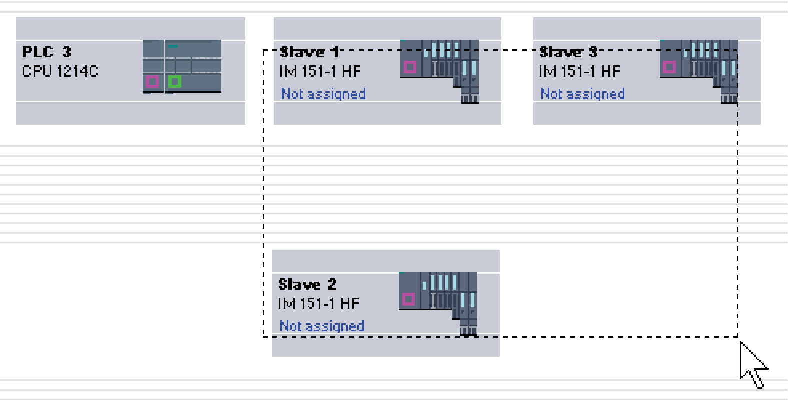
Requirements

DP master and DP slaves are placed in the network view.

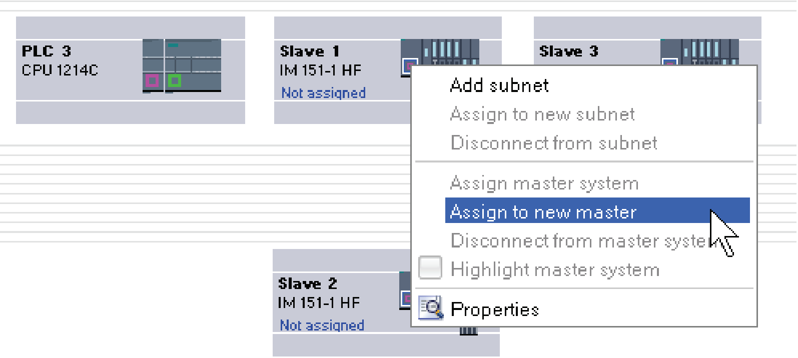
Assigning DP slaves to a DP master system

To do this, follow these steps:

1. Select an appropriate zoom factor so that you can see as many DP slaves as possible in the network view.
2. Arrange the DP slaves in a maximum of two rows.
3. Select all DP interfaces with the mouse cursor (not all devices!). This only works if you begin to drag the mouse cursor outside of the first DP slave and release the mouse button at the last DP slave (selection with the lasso).



4. Select the shortcut menu "Assign to new master" and select the corresponding DP interface for the DP master in the subsequent dialog.



5. The DP slaves are automatically networked with the DP master and combine with it to form a DP master system.

Note

When a DP master system is highlighted, you can double-click on a DP slave in the hardware catalog and thereby quickly add additional DP slaves. This will result in the DP slave being added to the highlighted DP master system automatically.

Creating a DP master system

Introduction

To create a DP master system, you need to have one DP master and at least one DP slave. As soon as you connect a DP master to a DP slave, a master-slave link is established.

DP master

You can use any of the following devices as a DP master:

- CM 1243-5

Requirements

- You must be in the network view.
- The hardware catalog is open.

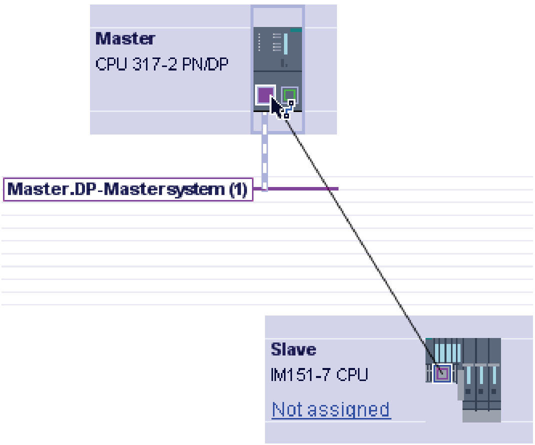
Procedure

To create a DP master system, follow these steps:

1. Select a DP master from the hardware catalog.
2. Pull the DP master onto the free area within the network view.
3. Right-click on the DP master's DP interface.
4. Select "Create master system" from the shortcut menu.

   A DP master system with one DP master will be created as a single node.

If you connect a DP slave's DP interface to that of the DP master, the DP slave will be added to the master system.



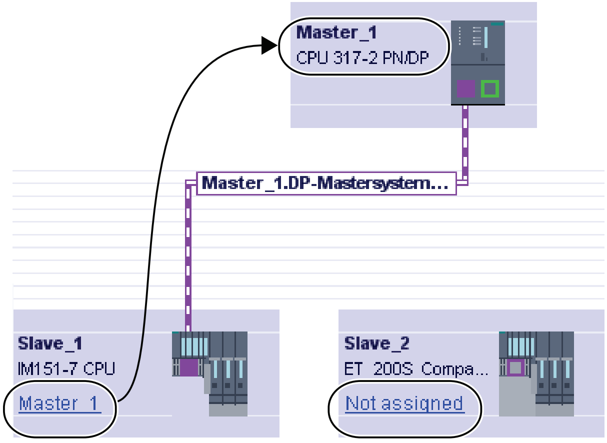
Assuming that you have already placed both a DP master and a DP slave within the network view, you can drag-and-drop to connect the two and thereby create a DP master system. To do so, follow these steps:

1. Click on the DP interface of either the DP master or DP slave.
2. Hold down the mouse button and draw a connecting line between this DP interface and that of the desired communications partner.

This will create a subnet with one DP master system between the DP master and DP slave.

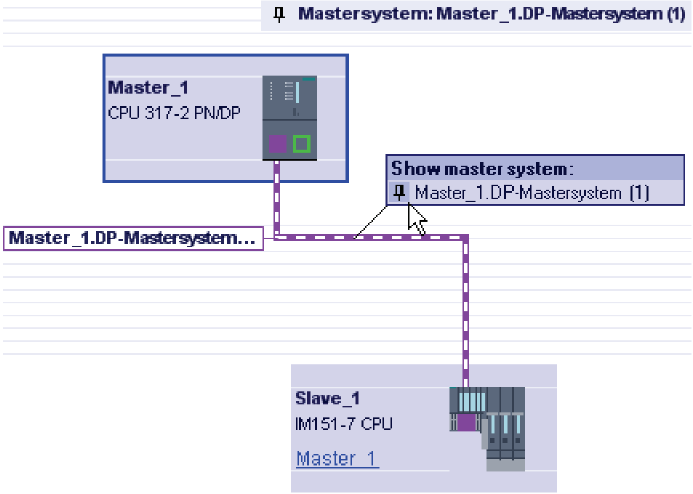
DP master display on the DP slave

When you connect a DP slave to a DP master, the name of the DP master is displayed on the DP slave as a hyperlink. Click the hyperlink to select the associated DP master.



Highlighting applied to the DP master system

When you create a new DP master system, highlighting will be applied to it. This enables you to identify quickly which devices belong to the DP master system. You can also highlight a DP master system yourself by moving the mouse pointer over a subnet. This will result in the names of the available DP master systems being displayed. Click the required DP master system to highlight it.



Mastersystem: Master_1.DP-Mastersystem (1)
Master_1
CPU 317-2 PN/DP
Show master system:
Master_1.DP-Mastersystem (1)
Master_1.DP-Mastersystem...
Slave_1
IM151-7 CPU
Master_1

There are various ways of removing the highlighting from a DP master system:

- Highlight a different master system.
- Click on the drawing pin with the name of the master system in the top right-hand corner of the network view.

Editing DP master systems and interfaces

Introduction

Once you have created a DP master system, you also have the option of disconnecting the DP master system and its components. This can result in subnets with DP slaves but no DP master.

Generally, there is no need to edit the interfaces of a DP master.

You can change the name and number on the DP master system.

Disconnection from DP master systems

If you have configured either a CPU with an integrated PROFIBUS DP interface or a PROFIBUS CP (that can be configured as an intelligent DP slave) as a DP master with master system, then you will be able to disconnect the DP master from the DP master system. After this, the device will no longer be connected to the DP master system.

Disconnecting the subnet for a DP master effectively eliminates the master system in the sense that it is no longer assigned to a DP master. However, the individual DP slaves remain interconnected via the subnet and any direct data exchange that has been configured remains unaffected.

If you delete the DP slaves or detach them from the master system, the master system is retained on the DP master.

Requirements

- You must be in the network view.
- There has to be a DP master system with one DP master and at least one DP slave.

Disconnecting the DP master from the DP master system

To disconnect the DP master system, proceed as follows:

1. Right-click on the DP master's DP interface.
2. Select "Disconnect from master system" from the shortcut menu.

The selected DP master will be disconnected from the DP master system. A subnet with the DP slaves will be retained.

Adding a DP master to the DP master system

To reassign a DP master to a subnet, proceed as follows:

1. Right-click on the DP master's DP interface.
2. Select "Create master system" from the shortcut menu.
3. Draw connecting lines between the new DP master system and the DP interfaces of the DP slaves.

The DP master combines with the DP slaves to recreate a DP master system.

Editing the properties of a DP master system

To edit the properties of a DP master system, proceed as follows:

1. Move the mouse pointer over a subnet with a DP master system.
2. A message will appear displaying the available DP master systems. Click the one you want to edit. The DP master system will now be color-highlighted.
3. Click on the highlighted DP master system.
4. In the inspector window, edit the DP master system attributes under "Properties > General".

Note

If you click a subnet when no DP master system is highlighted, you will be able to edit the properties of the entire subnet under "Properties" in the inspector window.

Adding DP slaves to the master system and configuring them

In the network view, you can add various DP slaves from the hardware catalog directly by using the drag-and-drop function or by double-clicking.

DP slaves

For configuration purposes, DP slaves are broken down into the following categories:

- Compact DP slaves
  (Modules with integrated digital/analog inputs and outputs, for example, ET 200L)
- Modular DP slaves
  (interface modules with S5 or S7 modules assigned, for example ET 200M)
- Intelligent DP slaves (I slaves)
  (CM 1242-5 or ET 200S with IM 151-7 CPU)

Rules

- Your DP master system should only contain one DP master, but it may contain one or or more DP slaves.
- You may only configure as many DP slaves in a DP master system as are permitted for the specific DP master.

Note

When configuring the DP master system, remember to observe the DP master technical data (max. number of nodes, max. number of slots, max. quantity of user data). User data restrictions may possibly prevent you from being able to use the maximum number of nodes that is theoretically possible.

Requirements

- You must be in the network view.
- A DP master system must have been created.

Adding a DP slave to the DP master system

To add a DP slave from the hardware catalog to the DP master system, follow these steps:

1. Select a DP slave from the hardware catalog.
2. Drag-and-drop the DP slave from the hardware catalog into the network view.
3. Draw a connecting line between the DP master's DP interface or a highlighted DP master system and the DP interface of the new DP slave.

A DP master system will be created and the DP slave will be connected to the DP master automatically.

Note

When a DP master system is highlighted, you can double-click the required DP slave in the hardware catalog. This will result in the DP slave being added to the highlighted DP master system automatically.

Disconnecting a DP slave from the DP master system

To disconnect a DP slave from the DP master system, follow these steps:

1. In the network view, right-click on the DP slave's DP interface.
2. From the shortcut menu, select the method for disconnecting from the DP master system:
   - "Disconnect from subnet": The PROFIBUS connection is broken and the device is no longer connected to the DP master system or a subnet.
   - "Disconnect from master system": The DP slave remains connected to the subnet, but is no longer assigned to the DP master system as a DP slave.

The selected DP slave will be disconnected from the DP master system.

Assigning a DP slave to a new DP master system

To assign an existing DP slave to a new DP master system, follow these steps:

1. Right-click on the DP slave's DP interface.
2. From the shortcut menu, select "Assign to new master".

   It does not matter whether the DP slave concerned is already assigned to another DP master system.
3. From the selection list, select the DP master whose DP master system is to have the DP slave connected to it.

   The selected DP slave is now assigned to a new DP master system.

The "Assign to new subnet" function works in a similar way in that it allows you to connect a DP slave to a new subnet. However, in this case, the DP slave will not be connected to an existing DP master system.

Configuring a DP slave

To configure a DP slave, follow these steps:

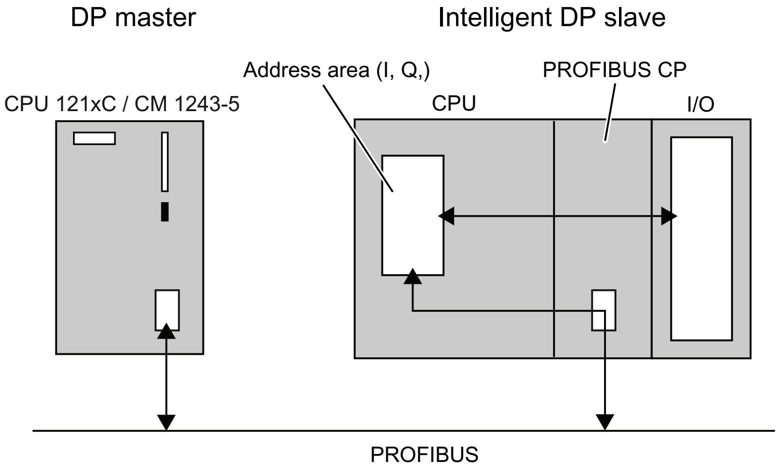
1. Switch to the DP slave's device view.
2. Select the module you want.
3. Configure the DP slave in the Inspector window.

Configuring intelligent DP slaves

Adding an I slave to a DP master system

Introduction

One of the characteristics of an intelligent DP slave (I slave) is that the DP master is not provided with I/O data directly by a real I/O, but by a preprocessing CPU. Together with the CP, this preprocessing CPU forms the I slave.



Difference: DP slave v. intelligent DP slave

In the case of a DP slave, the DP master accesses the distributed I/O directly.

In the case of an intelligent DP slave, the DP master actually accesses a transfer area in the I/O address space of the preprocessing CPU instead of accessing the connected I/O of the intelligent DP slave. The user program running on the preprocessing CPU is responsible for ensuring data exchange between the address area and I/O.

Note

The I/O areas configured for data exchange between the DP master and DP slaves must not be used by I/O modules.

Applications

Configurations involving intelligent DP slaves:

- I slave <> DP master data exchange
- Direct DP slave > I slave data exchange

Procedure

To add an I slave to a DP master system, follow these steps:

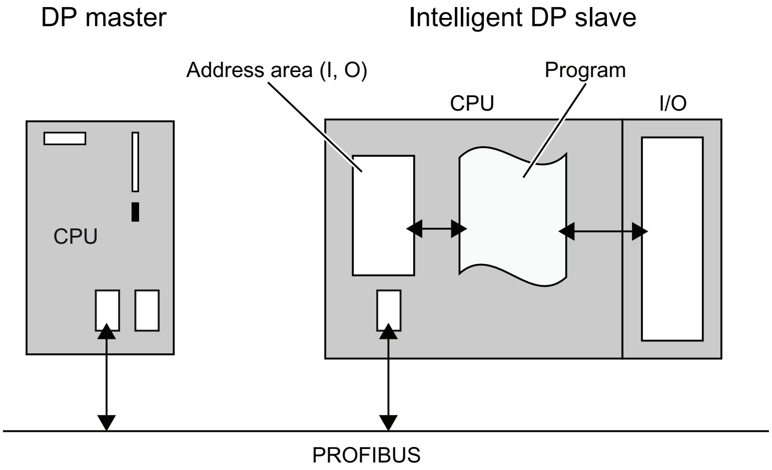
1. Drag two devices with PROFIBUS DP interface for configuration as DP master and I slave from the hardware catalog to the network view.
2. Draw a connecting line between the DP interfaces of both devices. This way you connect the I slave with a DP master in a DP master system.

   Result: You have now set up a DP master system with one DP master and one I slave.

Configuring access to I slave data

Data access

The following generally applies to I slaves: The address for the data transfer area and the address for the module on the I slave are different. This means that the start address occupied by a module can no longer be used for the transfer memory. If the higher-level DP master is to access the data of an I slave module, you will need to program this form of data exchange between the module and transfer area in the I slave user program.



Configuring the transfer area for data with DP slaves of the S7-1200

With CM 1242-5, the transfer area for the cyclic PROFIBUS data exchange is configured as transfer area in the parameter group "PROFIBUS interface > Mode > I Slave Communication".

Direct data access from CPU to CPU

Direct data access from CPU to CPU via PROFIBUS is supported by the S7-1200 PROFIBUS CMs only via the PUT/GET services.

Configuring DP slaves as distributed I/O devices

Configuring an ET 200S

Slot rules for configuring an ET 200S

The following rules apply when configuring an ET 200S:

- Do not leave any gaps when inserting the ET 200S modules.
- Slot 1: only for PM-E or PM-D Power Modules.
- To the left of an Electronics Module (EM): an EM or a Power Module (PM-E or PM-D) only.
- To the left of Motor Starter (MS): an MS, a PM-D, PM-D Fx (1..x..4) Power Module or a PM-X Power Module only.
- To the left of a PM-X: a motor starter or a PM-D only
- Up to 63 modules and one IM Interface Module are permitted

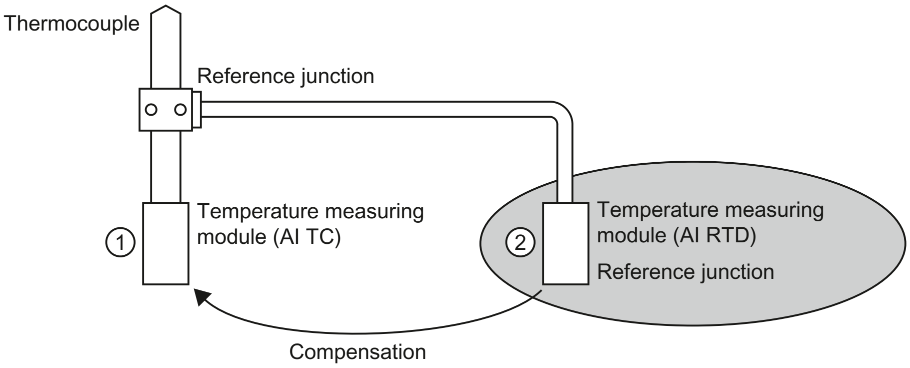
Note

Remember to ensure that the correct PM-E and EM voltage ranges are assigned.

Configuring reference junctions

A reference junction is the connection of a thermocouple to a supply line (generally in the terminal box). The voltage that occurs due to the effects of temperature falsifies the temperature value measured by the module.

On the ET 200S, one channel of the AI RTD module can be programmed as a reference junction. Other AI TC modules can correct their measured values using the temperature at the reference junction as measured by this module.



Thermocouple
Reference junction
Temperature measuring module (AI TC)
①
②
Temperature measuring module (AI RTD)
Reference junction
Compensation

① Configuring the AI TC:
→ Selection of the reference junction used

② Configuring of the AI RTD:
→ Activation of the reference junction
→ Specifying the slot and channel of the AI RTD

Special characteristics to be noted when assigning parameters for reference junctions

The process of assigning parameters for reference junctions will be explained based on the example of a resistance thermometer with a Pt 100 climatic range that is used for measuring the reference junction temperature.

To assign parameters for the reference junction, follow these steps:

1. In the ET 200S device view, insert an analog electronics module, for example a 2AI RTD HF.
2. Select the module on the rack.
3. Under "Properties > Inputs" in the inspector window, set a channel for the reference junctions function to the "RTD-4L Pt 100 climatic range" measuring range.
4. Select the ET 200S.
5. Under "Properties > Module parameters > Reference junctions" in the inspector window, select the "Reference junction" check box and specify the slot and channel number of the relevant RTD module.
6. Insert the analog electronics module for measuring the temperature using a thermocouple (TC module) and parameterize it with the reference junction number of the RTD module.

Additional information

For additional information on the various types and uses of ET 200S modules, please refer to the operating instructions and the manual titled "ET 200S Distributed I/O System".

For additional information on analog value processing, please see the documentation for the ET 200S distributed I/O system.

Packing addresses

Introduction

DP slaves and I/O devices from the ET 200S family are configured in the same way as other modular DP slaves and I/O devices. As well as supporting all the standard modular DP slave and I/O device functions, the ET 200S also offers the "Pack addresses" function:

When digital electronics modules requiring an address space of 2 or 4 bits are inserted into the device view, they will initially be spread over a total area of 1 byte. However, the address area actually occupied can be compressed after configuration using the "Pack addresses" function.

	Initial state	After "Pack addresses"
Module	I address	I address
2DI (2-bit)	Byte 10	10.0...10.1
4DI (4-bit)	Byte 11	10.2...10.5

Requirements

- You are in the device view.
- An ET 200S, for example an IM 151-1, must be present.
- A pair of digital electronics modules, for example 2DI AC120V ST, must be inserted into the slots.

Packing addresses

To pack addressed, follow these steps:

1. Select the electronics modules whose addresses are to be packed. The following options are available for selecting multiple electronics modules:
   – Press and hold down <Shift> or <Ctrl> while clicking the relevant electronics modules.
   – Click off the rack and select the required electronics modules by drawing round them with the mouse.
2. Click "Pack addresses" in the shortcut menu for the selected electronics modules.

The address areas for inputs, outputs and motor starters are packed separately. The packed addresses will be displayed in the I address and Q address columns of the device overview.

How packed addresses are generated and structured

If you make use of the "Pack addresses" function, the addresses of the selected electronics modules will be packed in accordance with the following rules:

- The start of the address area is determined by the lowest address of the selected electronics modules: X.0
- If the bit address is not "0", then the next (free) byte address as of which the selected area can be compacted will be selected automatically: (X+n).0
- If no coherent area exists, the addresses will be automatically packed into any available address gaps.

Electronics modules with packed addresses and the same byte address form a packing group.

Unpacking addresses

To unpack addressed, follow these steps:

1. Select one or more electronics modules with packed addresses.
2. Click "Unpack addresses" in the shortcut menu for the selected electronics modules.

The packing groups of the selected electronics modules will be disbanded and the packed addresses for the relevant electronics modules unpacked.

The packing group will also be disbanded and the packed addresses unpacked in the following cases: if you delete electronics modules from a packing group, move electronics modules out of a packing group or insert electronics modules on a free slot within a packing group.

The start addresses of the unpacked electronics modules will be assigned to the next available byte addresses in each case.

Special characteristics of electronics modules with packed addresses

The following special characteristics apply to electronics modules with packed addresses:

- As far as the CPU is concerned, there is no way of assigning a slot for the electronics module. Consequently, the instruction GADR_LGC (SFC 5) outputs error information W#16#8099 "Slot not configured" for the actual slot of the electronic module.
- The instruction LGC_GADR (SFC 49) and SZL-ID W#16#xy91 "module status information" cannot be evaluated for an electronics module.
- The electronics module receives an additional diagnostics address via the DPV1 function, because otherwise the packed addresses would prevent interrupts from being assigned as far as the CPU is concerned.
- The "Insert/remove interrupt" is not possible. This is because the "Pack addresses" and "Insert/remove interrupt" functions are mutually exclusive.

Configuring an ET 200S with option handling

You can use the option handling function to prepare the ET 200S for future expansions (options). This section describes option handling with reserve modules.

You do this by assembling, wiring, configuring, and programming the maximum configuration envisaged for the ET 200S and by using cost-effective reserve modules (138-4AA00 or 138-4AA10) during assembly until it becomes time to replace them with the necessary electronics modules.

Note

The ET 200S can be completely factory-wired with the master cabling, as no connection exists between a reserve module and the terminals of the terminal module (and, in turn, to the process).

Requirements

- ET 200S interface module
  - IM 151-1 STANDARD (6ES7 151-1AA03-0AB0 or higher)
  - IM 151-1 FO STANDARD (6ES7 151-1AB02-0AB0 or higher)
- Power module with option handling
  - PM-E DC24..48V
  - PM-E DC24..48V/AC24..230V

Procedure

To activate option handling, follow these steps:

1. Select the IM 151-1 in the device view and enable it in "Option handling" check box under "Properties > General > Option handling" in the inspector window.
2. Select the numbered check boxes for the slots that are initially to accommodate the reserve modules prior to the future electronics modules.
3. Select the power module in the device view and enable it in the "Option handling" check box under "Properties > Addresses" in the inspector window. Reserve the necessary address space for the control and check-back interface in the process image output (PIQ) and process image input (PII).

The assembled reserve modules can be replaced with the configured modules at a later date without having to modify the configuration.

Note

The addresses for these interfaces are reserved as soon as you activate option handling on the power module. The "Option handling" function must also be activated on the DP slave (IM 151-1 STANDARD Interface Module). If it is not activated, the addresses reserved for the control and check-back interface will be released again.

Note that activating and deactivating the option handling function repeatedly can change the address of the control and check-back interface.

Option handling may be activated for one PM-E DC24..48V or one PM-E DC24..48V/AC24..230V Power Module only.

Additional information

For additional information on the assignment and significance of bytes within the process image, option handling with PROFIBUS and the use of reserve modules, please refer to the documentation for the ET 200S distributed I/O system.

How option handling works during startup

If "Startup when expected/actual config. differ" is not available, the ET 200S will still start up if a standby module is inserted instead of the configured electronics module and option handling has been activated for the slot concerned.

How option handling works during operation

During operation, the option handling mode varies in accordance with the following:

- Option handling enabled for a slot:
  Either the standby module (option) or the configured electronics module can be plugged into this slot. If any other kind of module is present on this slot, diagnostics will be signaled (no module/incorrect module).
- Option handling disabled for a slot:
  Only the configured electronics module can be plugged into this slot. If any other kind of module is present, diagnostics will be signaled (no module/incorrect module).

Standby module substitute values

- Substitute value for digital inputs: 0
- Substitute value for analog inputs: 0x7FFF

Control and evaluation in the user program

The ET 200S is equipped with a control and feedback interface for the "Option handling" function.

The control interface is located in the process image output (PIQ). Each bit in this address area controls one of the slots from 2 to 63:

- Bit value = 0: Option handling parameterized. Standby modules are permitted.
- Bit value = 1: Option handling canceled. Standby modules are not permitted on this slot.

The check-back interface is located in the process image input (PII). Each bit in this address area provides information about the modules that are actually plugged into slots 1 to 63:

- Bit value = 0: This slot has the standby module, an incorrect module or no module plugged into it.
- Bit value = 1: This slot has the configured module plugged into it.

Configuring the ET 200S in DPV1 mode

PROFIBUS DPV1 enables you to access extended PROFIBUS functions.

Requirement

- You must be in network view.
- A DP master with DPV1 functionality must be available.
- A master-slave connection must be established with PROFIBUS.

Procedure

To switch the DP slave over to DPV1, follow these steps:

1. Select the DP slave.
2. Under "Properties > Module parameters" in the Inspector window, select "DPV1" mode from the "DP interrupt mode" drop-down list.

or

1. Select the DP master.
2. In the I/O communications table, select the row with the connection between the DP master and the desired DP slave.
3. Under "Properties > Module parameters" in the Inspector window, select "DPV1" mode from the "DP interrupt mode" drop-down list.

Special characteristics

The parameters are subject to interdependencies, which are outlined below:

Parameter	DPV0 mode	DPV1 mode
Operation when target configuration does not match actual configuration	Fully available	Fully available
Diagnostics interrupt (OB 82)	Not available, not set	Fully available
Hardware interrupt (OB 40 to 47)	Not available, not set	Fully available
Insert/remove interrupt (OB 83)	Not available, not set	Only available when addresses are not packed. "Startup when target configuration does not match actual configuration" is activated automatically along with an insert/remove interrupt.

Interrupts in the case of modules with packed addresses

If the module is capable of triggering interrupts and the bit address is not equal to 0 because of packed addresses, you will need to assign a diagnostics address in the ET 200S address dialog.

The diagnostics address is required for the purpose of assigning a DPV1 interrupt to the module as an interrupt trigger. The CPU will only be able to assign an interrupt correctly and store information on the interrupt in the interrupt OB start information/in the diagnostics buffer if the module concerned has this "unpacked" address. In this context, the CPU cannot make use of "packed" addresses.

From the point of view of interrupt processing (interrupt OB), this means the module will have the assigned diagnostics address, but from the point of view of processing the input and output data in the user program, the module will have the packed addresses.

Note

When the module addresses are packed, the insert/remove interrupt for the ET 200S is unavailable.

Using GSD files

GSD revisions

What you need to know about GSD revisions

The properties of DP slaves are made available to configuration tools by means of GSD files.

Functional enhancements in the area of the distributed I/O will have an effect on the GSD specification, for example, they will require the definition of new keywords.

This results in the versioning of the specification. In the case of GSD files, the version of the specification on which a GSD file is based is called a "GSD revision".

From GSD revision 1, the GSD revision must be included as a keyword "GSD_revision" in GSD files. GSD files without this keyword will therefore be interpreted by configuration tools as GSD revision "0".

GSD files can be interpreted up to GSD revision 5. This means that DP slaves that support the following functions, for example, will be supported:

- Diagnostic alarms for interrupt blocks
- Isochronous mode and constant bus cycle time
- SYNC/FREEZE
- Clock synchronization for DP slaves

Installing the GSD file

Introduction

A GSD file (device data file) contains all the DP slave properties. If you want to configure a DP slave that does not appear in the hardware catalog, you must install the GSD file provided by the manufacturer. DP slaves installed via GSD files are displayed in the hardware catalog and can then be selected and configured.

Requirement

- The hardware and network editor is closed.
- You have access to the required GSD files in a directory on the hard disk.

Procedure

To install a GSD file, proceed as follows:

1. In the "Options" menu, select the "Install device master data files" command.
2. In the "Install device master data files" dialog box, choose the folder in which you want to save the GSD files.
3. Choose one or more files from the list of displayed GSD files.
4. Click on the "Install" button.
5. To create a log file for the installation, click on the "Save log file" button.

   Any problems during the installation can be tracked down using the log file.

You will find the new DP slave installed by means of the GSD file in a new folder in the hardware catalog.

Note

Installation of GSD file cannot be undone.

Configuring GSD-based DP slave

DP slaves that you have inserted through installation of a GSD file can be selected as usual via the hardware catalog and inserted in the network view. If you want to insert the modules of the GSD-based DP slaves, you must take into account some particular details.

Requirements

- You have installed a DP slave using a GSD file.
- You have inserted the head module in the network view in the usual manner.
- The device overview opens in the device view.
- The hardware catalog is open.

Procedure

To add the modules of a GSD-based DP slave, proceed as follows:

1. In the hardware catalog, navigate to the modules of the GSD-based DP slave.

   GSD-based DP slaves, also referred to as DP standard slaves, can be found in the "Other field devices" folder of the hardware catalog.
2. Select the desired module.
3. Use drag-and-drop to move the module to a free space in the device overview.
4. Select the module in the device overview to edit parameters.

You have now inserted the module in a free slot of the GSD-based DP slave and can edit its parameters.

Note

You can see only the GSD-based DP slave in the graphic area of the device view. The added modules of GSD-based DP slaves are only found in the device overview.

Preset configuration

For modules with an adjustable preset configuration, you can change this configuration in the inspector window under "Properties > Preset configuration".

8.1.4.3 Configurations for PROFINET IO

What you need to know about PROFINET IO

What is PROFINET IO?

PROFINET IO

PROFINET is an Ethernet-based automation standard of PROFIBUS Nutzerorganisation e.V. (PNO) which defines a manufacturer-neutral communication, automation and engineering model.

Objective

The objective of PROFINET is:

- Integrated communication via field bus and Ethernet
- Open, distributed automation
- Use of open standards

Architecture

The PROFIBUS User Organisation e.V. (PNO) has designated the following aspects for PROFINET architecture:

- Communication between controllers as components within distributed systems.
- Communication between field devices, such as I/O devices and drives.

Implementation by Siemens

The demand for "Communication between controllers as components within distributed systems" is implemented by "Component Based Automation" (CBA). Component Based Automation is used to create a distributed automation solution based on prefabricated components and partial solutions.

The demand for "Communication between field devices" is implemented by Siemens with "PROFINET IO". Just as with PROFIBUS DP, the complete configuration and programming of the components involved is possible using the Totally Integrated Automation Portal.

The following sections deal with the configuration of communication between field devices using PROFINET IO.

Overview of RT classes

RT classes in PROFINET IO

PROFINET IO is a scalable, real-time communication system based on Ethernet technology. The scalable approach is reflected in several real-time classes:

- RT: Transmission of data in prioritized, non-isochronous Ethernet frames. The required bandwidth is within the free bandwidth area for TCP/IP communication.
- IRT: Isochronous transmission of data with high stability for time-critical applications (for example, motion control). The required bandwidth is from the area of bandwidth reserved for cyclic data.

Depending on the device, not all real-time classes are supported.

Connecting existing bus systems

Connection of PROFINET and PROFIBUS

PROFINET IO and PROFIBUS DP can be connected with each other as follows:

- via Industrial Ethernet:

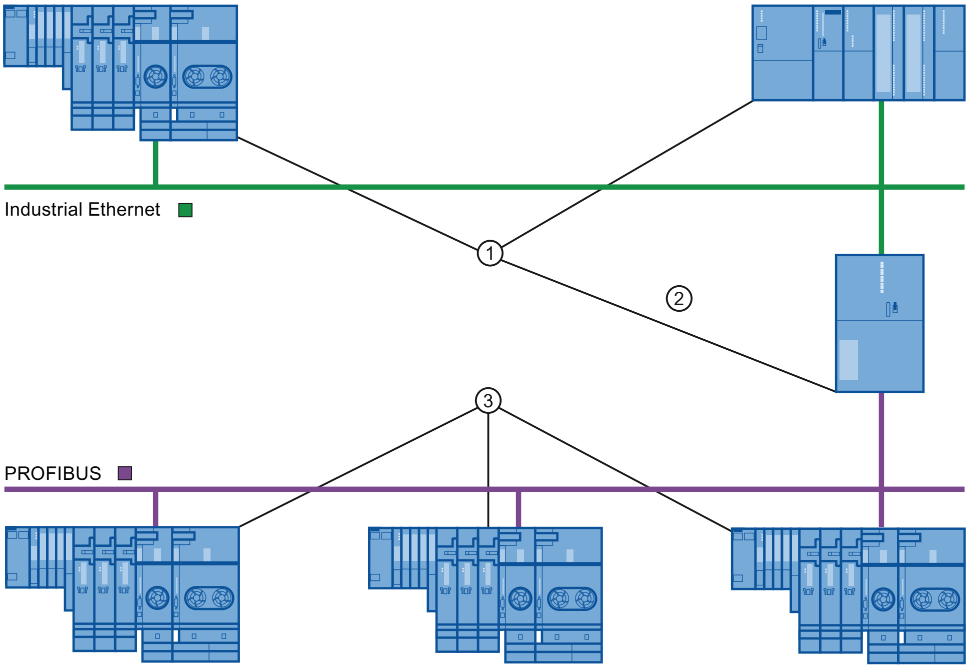
  To connect the two network types, Industrial Ethernet (control level) and PROFIBUS (cell level/field level), use e.g. the IE/PB link.

- via Industrial Wireless LAN:

  PROFIBUS devices, for example, can be connected to PROFINET IO via a wireless LAN/PB link. This allows existing PROFIBUS configurations to be integrated into PROFINET.

AS interface devices can be connected by an IE/AS-i link PN IO to the interface of a PROFINET device. This allows the existing AS-i network to be integrated into PROFINET.

The following figure shows the connection of a PROFIBUS subnet via PROFINET device with proxy functions.



① PROFINET devices
② PROFINET device with proxy functions (for example, IE/PB link)
③ PROFIBUS devices

PROFINET device with proxy functions used as proxy for a PROFIBUS device

The PROFINET device with proxy functions is the proxy for a PROFIBUS device on the Ethernet. Proxy functionality allows a PROFIBUS device that can communicate with all devices on the PROFINET and not just with its master.

Using PROFINET, existing PROFIBUS systems can easily be integrated into PROFINET communication using the proxy functions.

If, for instance, you connect a PROFIBUS device via an IE/PB link to PROFINET, the IE/PB link acts as a proxy for the PROFIBUS components to establish communication via PROFINET.

Configuration using IE/PB link PN IO

Configuration using IE/PB link PN IO

Use the IE/PB link IO to connect PROFIBUS DP configurations to PROFINET IO.

From the CPU perspective, the PROFIBUS DP slaves are connected to the same network as the IE/PB link PN IO. These slaves have the same device names and IP addresses as the IE/PB link PN IO, but different device numbers. Furthermore, each also has a specific PROFIBUS address.

In the properties of the IE/PB link, the PROFIBUS addresses of the connected DP slaves are displayed in addition to the PROFINET device numbers, as this device has two addressing schemes.

Handling device numbers and PROFIBUS addresses on the master system

During placement, the same number is assigned for the PROFINET device number and the PROFIBUS address.

In the inspector window under "General Properties > PROFINET device number", you can find an overview of the device numbers used and the PROFIBUS addresses of an IE/PB link. The device number can also be changed here. You can also set that the device number and the PROFIBUS address should or should not always be identical. If the "PROFINET device number=PROFIBUS address" is activated, you do not have to track the device number when the PROFIBUS address changes.

The PROFIBUS addresses can be changed in the properties of the PROFIBUS device.

Restrictions

The following restrictions apply to DP slaves configured as described above on the PROFIBUS subnet of an IE/PB link:

- No pluggable IE/PB link
- No pluggable DP/PA link
- No pluggable Y link
- Not CiR-compliant
- No pluggable redundant slaves
- No isochronous transmission / constant bus cycle time can be configured
- SYNC/FREEZE instructions ("DPSYC_FR") of a CPU on the the Ethernet subnet for DP slaves behind the IE/PB-Link are not supported.

Configuration using IWLAN/PN link

Maximum number of devices in a IWLAN segment

If an Ethernet subnet is set up as wireless network (IWLAN = Industrial Wireless LAN), cyclic data exchange between IO controllers and IO devices is possible via a wireless route.

On one side of the wireless route there are fixed installed access points (for example, SCALANCE W 788) and on the other side mobile stations (with, for example IWLAN/PB links with PROFIBUS devices).

If the action radius of the mobile stations is large, it may be necessary to install several access points (SCALANCE W 788). Since each access point forms a segment with its wireless range, the IWLAN is made up of a series of segments.

The mobile devices "on the one side" of the wireless link with their IWLAN/PB links can move along the segments.

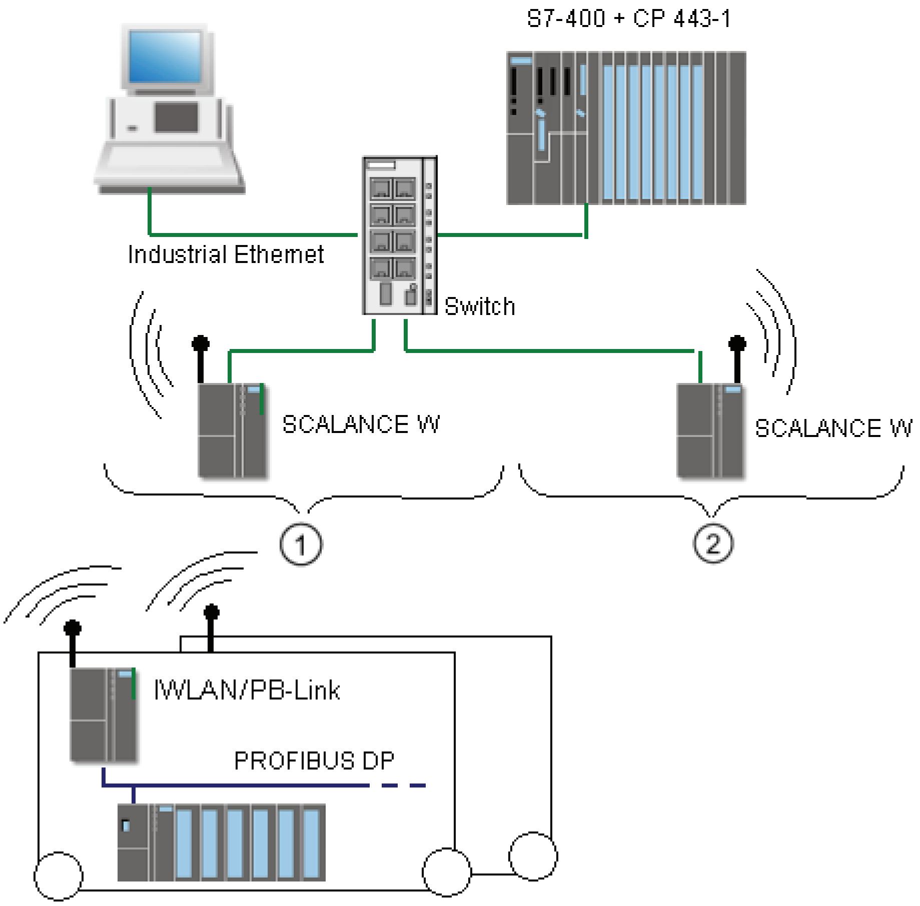
Special feature

If several IWLAN/PB links are located within a segment, they have to share the bandwidth that is available for wireless transmission. This leads to a lengthening of the update time for these devices.

Example

In the following example there are two IO devices (IWLAN/PB link) with a segment.

If no more than a maximum of two IWLAN/PB links are present in a IWLAN segment at the same time, enter a "2".



①	Segment 1
②	Segment 2

Configure PROFINET IO

Addressing PROFINET devices

Assigning addresses and names to PROFINET devices

In this chapter you will learn which address and naming conventions are valid for the PROFINET devices.

IP addresses

All PROFINET devices work with the TCP/IP protocol and therefore require an IP address for Ethernet operation.

You can set the IP addresses in the module properties. If the network is part of an existing company Ethernet network, ask your network administrator for this data.

The IP addresses of the IO devices are assigned automatically, usually at CPU startup.

Device names

Before an IO device can be addressed by an IO controller, it must have a device name. This procedure was chosen for PROFINET because names are easier to administer than complex IP addresses.

Both the IO controller as well as IO devices have a device name. The device name is automatically derived from the name configured for the device (CPU, CP or IM):

- The PROFINET device name is made up of the name of the device (for example, the CPU), the name of the interface (only with multiple PROFINET interfaces) and optionally the name of the IO system:

  <CPU name>.<Name of the interface>.<IO system name>

  You cannot change this name directly. You change the PROFINET device name indirectly, by changing the name of the affected CPU, CP or IM in the general properties of the module. This PROFINET device name is also displayed, for example, in the list of accessible devices.
- A "converted name" is generated from the PROFINET device name. This is the device name that is actually loaded into the device.

  The PROFINET device name is only converted if it does not comply to the rules of IEC 61158-6-10. You cannot change this name directly either.

Rules for the converted name

The rules for the converted name are listed in the following section. If the converted name is **not** different from the name of the module, the name of the module must comply with this rule.

- The name consists of one or more labels , which are separated by a dot [.].
- Total length of the name: 1 to 240 characters
- Length of a label: 1 to 63 characters
- A label consists of the characters [a-z0-9-]
- Labels should not start or end with the "-" character
- The first label should not start with "port-xyz" or "port-xyz-abcde" (a,b,c,d, e,x,y,z=0-9)
- The name should not have the following form: n.n.n.n (n=0-999)

Example of device names

```
device-1.machine-1.plant-1.vendor
```

If you assign this name, to a CPU for example, STEP 7 will not convert it.

Device number

In addition to the device name, a device number is also automatically assigned when an IO device is plugged in. You can change this number.

Devices in the PROFINET subnet

In a PROFINET subnet the maximum allowable number of devices is monitored during configuration.

See also

Assigning the device name and IP address (Page 495)

Retentivity of IP address parameters and device names (Page 502)

Assigning the device name and IP address

Assigning an IP address and subnet mask for an IO controller the first time

There are various options for this: During the configuration of PROFINET interface, you have to set the following:

- IP address is set in the project.
- IP address is set using a different method.

Assign an IP address	Comments
Option: Set IP address in the project: With download hardware configuration	With the downloading of the hardware configuration to the IO controller (e.g. CPU), the IP address and the device name are also downloaded.
Option: Set IP address in the project: Assign online via PROFINET interface	Connect your programming device/PC to the same network as the relevant PROFINET device. The interface of the PD/PC must be set to TCP/IP (Auto) mode. Have a list of accessible devices displayed. Select the target device via its MAC address and then assign its configured IP address before you download the hardware configuration including the configured IP address (IP address is then saved retentively).
Option: Set IP address in the project: Assign online via MPI/PROFIBUS interface	If your PROFINET device has an MPI or PROFIBUS DP interface, connect your programming device/PC directly to the PROFINET device via the MPI or PROFIBUS DP interface. The configured IP address is applied during download of hardware configuration.
Option "Use different method to obtain IP address" • Assign online • Assign via user program • Higher-level IO controller (only with I devices)	If you have selected this option in the properties of the PROFINET interface, the IP address can be assigned by the online and diagnostics editor, by the primary setup tool or by the user program ("IP_CONF" instruction).. In case of an S7-1200-CPU, make sure that access to the CPU is not protected by a password. If the CPU is write-protected, no IP address and no device name can be assigned by any other method.

Commissioning a PROFINET interface

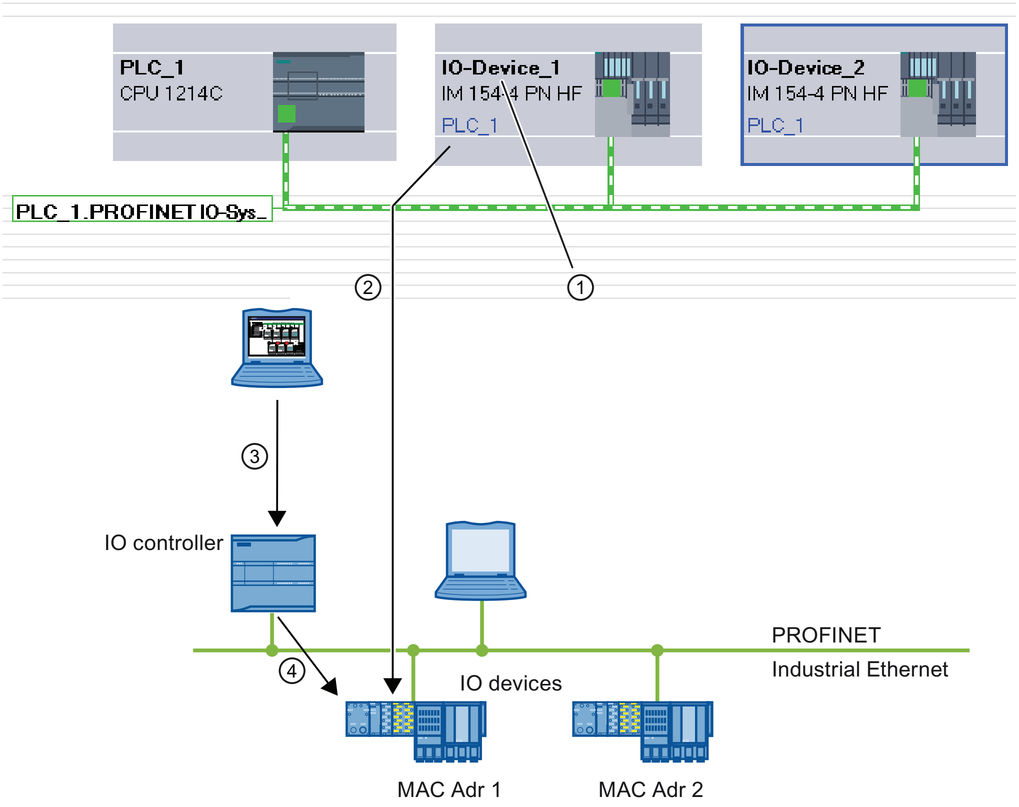
Further details of how to commission a PROFINET interface can also be found in the operating instructions for the PROFINET devices from the SIMATIC family.

Assigning device names for IO devices when the "Device replacement without removable media/PG" option is enabled

For IO devices where the "Device replacement without removable media/PG" option is activated, it is not necessary to assign the device name in the case of a device replacement.

Assigning a device name and address for an IO device (exception in the case device exchange without media change/PG)

The following graphic illustrates the process for assigning the device name and address.



① Each device receives a name; STEP 7 automatically assigns an IP address.

② STEP 7 generates a PROFINET device name from the name. This is then assigned to an IP device online (MAC address) and is written into the device.

③ The configuration is downloaded to the IO controller.

④ The IO controller assigns the appropriate IP address to the IO device with the assigned PROFINET device name during startup.

A device name is assigned to each IO device. You can change the name and IP address manually.

You have two options for downloading configured data to the PROFINET IO device:

- Offline with a Micro Memory Card:

  Place the configured data (device name: for example, turbo-3) for the IO device in the MMC in the PG/PC. Use the command "SIMATIC Card Reader > Save Device Name to Memory Card" in the "Project" menu for this.

  Then insert the MMC into the IO device. The IO device automatically adopts the configured device name.

- Online with programming device/PC:

  Connect the programming device/PC directly to the Ethernet subnetwork via the PROFINET interface.

  Select the subnet in the network view and then select the "Assign device name" shortcut command.

  In the "Assign PROFINET device name" dialog box, select the suitable PG/PC interface to connect to the Ethernet subnet.

  All configured PROFINET device names are in the top drop-down list. Select a PROFINET device name from it and select the IO device to receive this device name from the table at the bottom. You can filter the display of devices in the table according to various criteria.

  You can easily identify the device using the "Flash LED" button.

  The IO controller recognizes the IO device by its device name and automatically assigns the configured IP address to it.

IP address assignment for special IO devices

Special IO devices, for example, SCALANCE X, S7 300 CPs, support the option of assigning the IP addresses not from the IO controller during startup. In this case, the IP address is assigned in a different way. For additional information, refer to the manual of the respective PROFINET device of the SIMATIC device family.

Requirement for additional procedures when assigning IP address and device name

If the IO device, as described above, should not obtain the IP address or device name from the IO controller, proceed as follows:

1. Select device or network view.
2. Open the properties for the respective PROFINET device.
3. Select the "Use different method to obtain IP address" option or "Different method for obtaining device name" option.

Rules

If the "Different method for obtaining IP address / device name" option is used in a PROFINET device, note the following:

- The subnet part of the IP address of the IO device must match the subnet part of the IP address of the IO controller.
- The corresponding PROFINET device cannot be used as a router.

See also

Calling the name assignment function from the project tree or via the "Online" menu (Page 676)

Example of the assignment of the device name

In this example you assign device names to a PROFINET IO controller and a PROFINET IO device. To make assignment easier, the device names should also contain the names of the PROFINET IO system.

Requirements

- You must be in the network view.
- A CPU 1214C (V2.0 or higher) must be available in the network view.
- An IM 151-3PN is available.
- The PROFINET interfaces of both modules are networked.

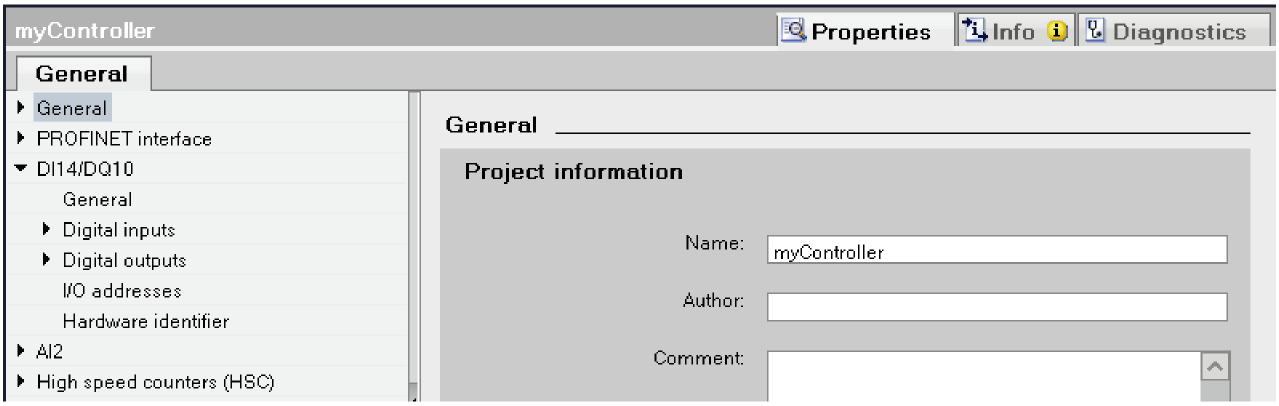
Procedure

To assign the names, follow these steps:

1. Select the CPU.

   Make sure that you have selected only the CPU and not the complete device!

2. Assign the name "myController" in the Inspector window, under "General".



myController

General

Project information

Name: myController

Author:

Comment:

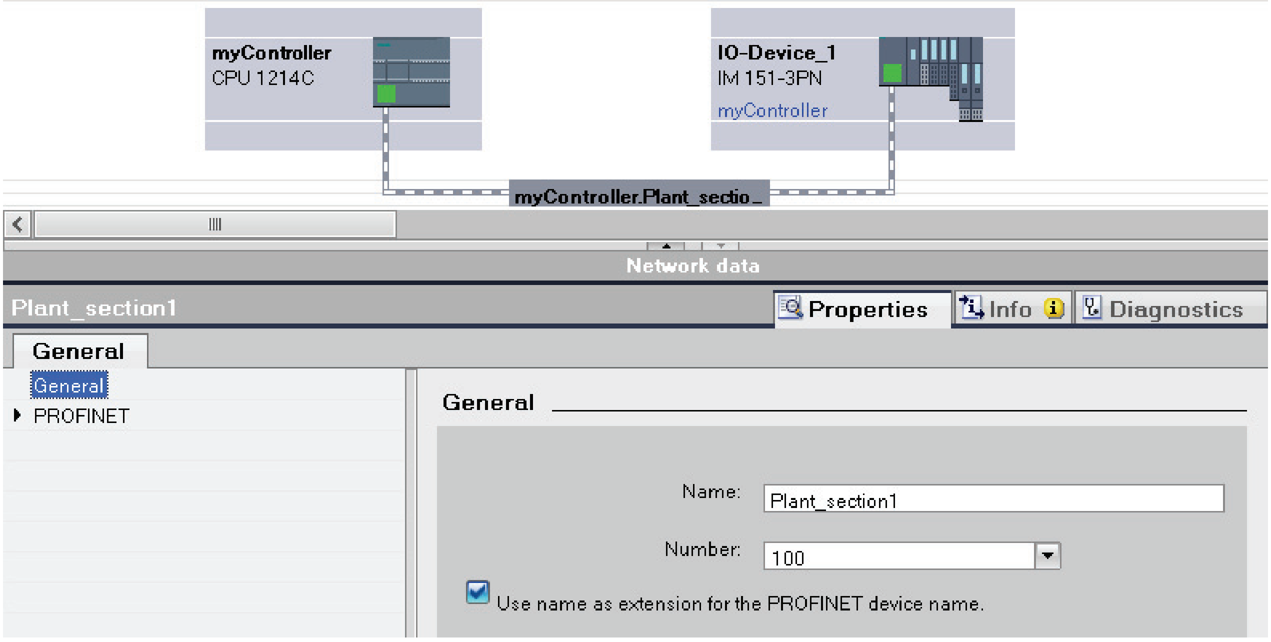
3. Select the IM.

   Make sure that you have selected only the IM and not the complete device ET200S!

4. Assign the name "Device_1" in the Inspector window, under "General".

5. Right-click on the PROFINET IO system and select the "Properties" command.

6. Assign the name "Plant_section1" to the IO system and select the check box "Use name as extension for PROFINET device names".

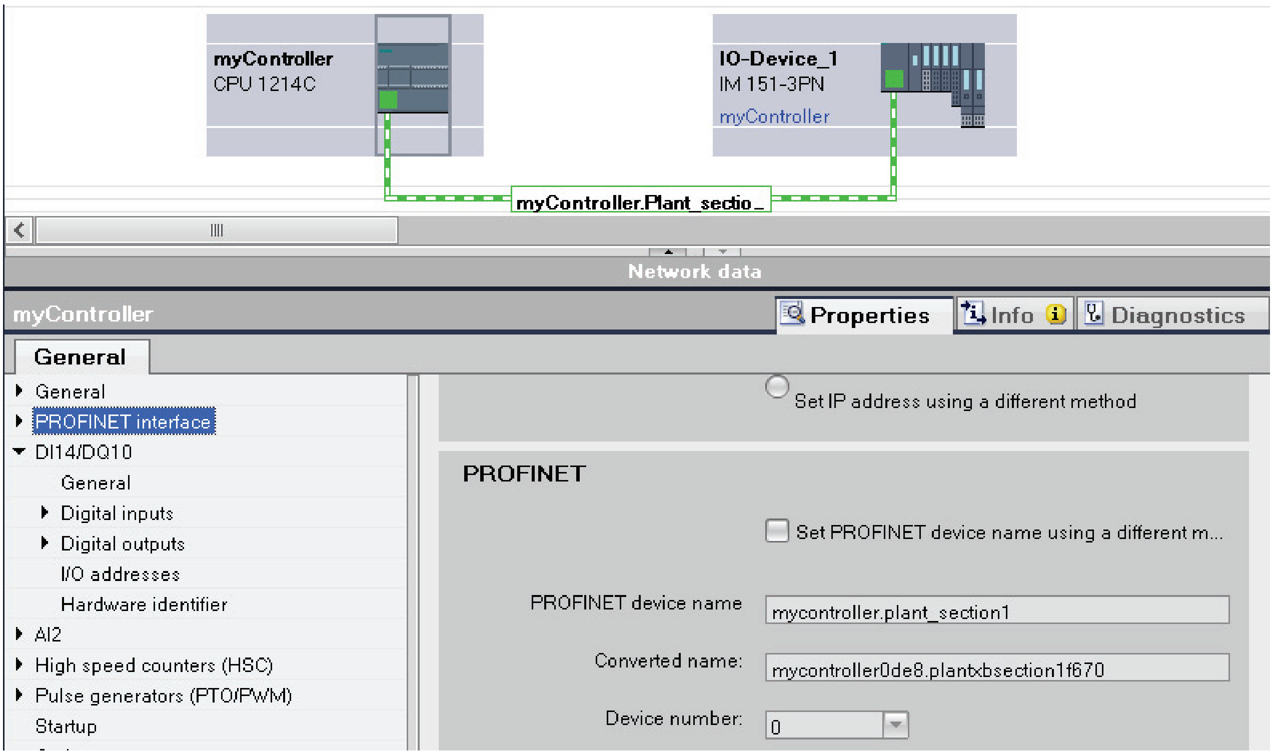


Name: Plant_section1

Number: 100

☑ Use name as extension for the PROFINET device name.

7. You can find the automatically generated PROFINET device names at the selected device in the Inspector window, at "PROFINET interface".



○ Set IP address using a different method

PROFINET

☐ Set PROFINET device name using a different m...

PROFINET device name: mycontroller.plant_section1

Converted name: mycontroller0de8.plantxbsection1f670

Device number: 0

The PROFINET device name corresponds to the name of the module (with the name of the IO system as extension) with the difference that only lower case text is used. Background: No distinction is made between upper and lower case ("case insensitive") for the storing of the name.

The converted name is displayed below. This is the name that is automatically generated from the PROFINET device name and satisfies the DNS conventions. If you work with STEP 7, you do not require this name. This name is displayed here as a check and corresponds to the name that is stored in the device. If you work with other tools that are able to record the data exchange and read the actual device names, then you find the converted names.

Other special features

For PROFINET devices with multiple PROFINET interfaces, the name of the interface is attached to the name of the module, separated by a dot.

Example:

- Name of the module: myController
- Name of the interface: Interface_1
- PROFINET device name: mycontroller.interface_1

Assign device name via memory card

Introduction

You can configure the device names of PROFINET IO devices offline. To do this, store a configured device name on a memory card and then insert the card into the appropriate IO device.

If an IO device has to be completely replaced due to a device defect, the IO controller automatically reconfigures the new device. Using the memory card, a device can be replaced without a programming device.

Requirements

- The programming device has a card reader for memory cards.
- The IO device must support the assignment of the device name via memory card.
- The station and its PROFINET IO system is configured.

Procedure

To store a device name on a memory card, follow these steps:

1. Insert the memory card into the card reader.
2. Select the IO device whose device name is to be assigned by the memory card.
3. Select the "Card reader > Save Device Name to Memory Card" command in the "Project" menu.

   If the memory card is not empty, a message will be issued informing you of this and you will have the option to delete the card.

Retentivity of IP address parameters and device names

The retentivity of IP address parameters (IP address, subnet mask, router setting) and device name depends on how the address is assigned. The non-retentive, temporary assignment means:

- IP address parameters and device name remain valid for the following time period:
  - Until the next POWER OFF
  - Until the next bootstrap
  - Until termination of the online connection (for example, after downloading the program)

    After POWER OFF / POWER ON or a permanent deletion, the CPU can only be accessed via the MAC address.
- Loading a temporary IP address also deletes the retentive, saved IP address parameter.

IP address parameters and device name not assign retentively

If the IP address parameters are not retentive, communication can no longer take place after the above described events (for example, after POWER OFF/POWER ON) that are based on the IP protocol.

IP address parameters and device name are not retentive in the following case:

- The properties of the PROFINET interface have a setting specifying that the IP address is to be obtained by another method.
- The device is a "normal" IO controller and it is specified in the user program ("IP_Conf" instruction) that the IP address parameters/device name is not to be retentive.

Non-retentive IP address parameters with an I device:

- If the device is an I device, the IP address is assigned by a higher-level IO controller and no prioritized startup is set, no IP address parameters can be assigned retentively via the online and diagnostics view. In this case the IP parameters are not retentive.

Recommendation

If possible, use the "Set IP address in project" and specify an appropriate IP address. In this case, the IP address is assigned retentively.

Resetting the IP address parameters and device names

Retentive IP address parameters and device names can be reset as follows:

- By "Reset to factory settings" (reset to delivery state with the option of also resetting the IP address parameters and the device name)
- Through a Firmware update

NOTICE
Consequences of repeated assignment of IP address parameters on top of existing IP parameters • Through the temporary assignment of IP address parameters / device names, a reset of retentively saved IP address parameters/device names occurs. • With a fixed assignment of IP address parameters/device names, previously retentively saved parameters are replaced with the newly assigned parameters.

NOTICE
Reuse of devices Execute the "Reset to factory settings" before you install a device with retentive IP address parameters / device names in different subnetworks / systems or before you place it in storage.

Creating a PROFINET IO system

A PROFINET IO system is comprised of a PROFINET IO controller and its assigned PROFINET IO devices.

To create a PROFINET IO system you require an IO controller (for example, CPU 1214C) and one or more IO devices (for example, a head module from the distributed I/O family ET 200S).

As soon as you connect an IO controller to an IO device, a controller-device link is established.

Procedure

To create a PROFINET IO system, proceed as follows:

1. Use drag-and-drop to pull an IO controller from the hardware catalog (for example, CPU 1214C) into the free area of the network view.

   The IO controller is created in the project.
2. Use drag-and-drop to move an IO device from the hardware catalog (for example, ET 200S) into the free area of the network view.
3. Click on the PROFINET interface of the IO controller or the IO device.
4. Hold down the mouse button and draw a connecting line between this selected interface and that of the partner device.

   A subnet with an IO system between the IO controller and the IO device is created.
5. If required, adapt the properties of the Ethernet subnet or the IO controller (for example, IP address) under "Properties" in the inspector window.

Handling PROFINET IO systems

Using shortcut menu commands, you can delete PROFINET IO systems, create new ones or even connect the interface to another subnet from within the network view.

An existing PROFINET configuration can thereby be corrected in the network view.

Create new PROFINET IO system for IO controller

To create a new PROFINET IO for an IO controller, proceed as follows:

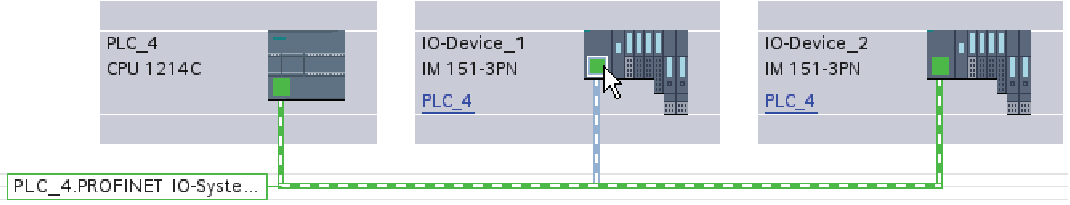
1. Make sure that no IO system is already assigned to the IO controller. If an IO system is already assigned to the IO controller, the "Assign IO system" shortcut menu command is disabled.
2. Select the PROFINET interface and then select the "Assign IO system" shortcut menu command.

A new PROFINET IO system is created at the IO controller and you can assign IO devices to this IO system.

Disconnecting PROFINET IO devices from PROFINET IO system

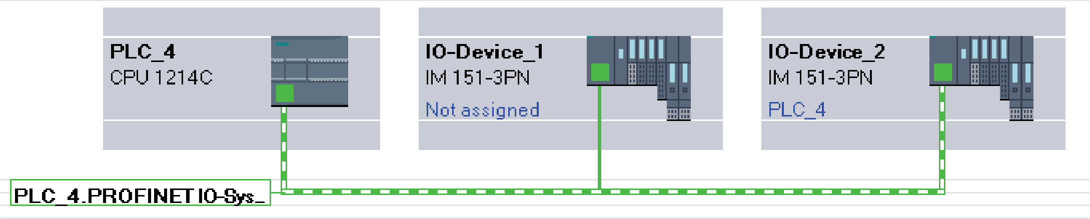
To disconnect an already networked PROFINET IO device from its PROFINET IO system, follow these steps:

1. Click on the PROFINET interface of an IO device.



2. Select the "Disconnect from IO system" shortcut menu command.

   The IO device that was assigned to this IO system is then no longer assigned to it.



You can create a new IO systems and can assign each of the non-assigned IO devices to an IO controller.

Assign PROFINET IO devices to other IO controllers

Existing PROFINET IO systems can be easily reconfigured in the network view:

1. Select the interface of an IO device and then select the shortcut menu. You have the following options here:
   - Assign a new subnet to the IO device or disconnect it from the existing subnet
   - Assign a new IO controller to the IO device
   - Assign a new IO system to the IO device or disconnect it from the existing subnet
2. To assign another IO controller to the IO device, select the "Assign to new IO controller" shortcut menu command.

   If there is no connection, a subnet is automatically created and the IO device is assigned to the IO system of the new IO controller.

Tip: Quick configuration of IO systems

If the IO system has a lot of IO devices, assign all IO devices placed by drag-and-drop operation to an IO controller on one step.

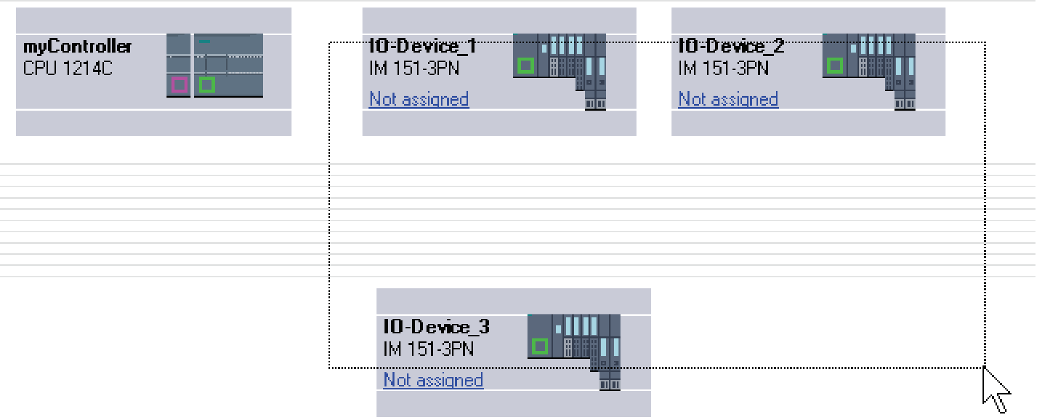
Requirements

IO controller and IO devices are placed in the network view.

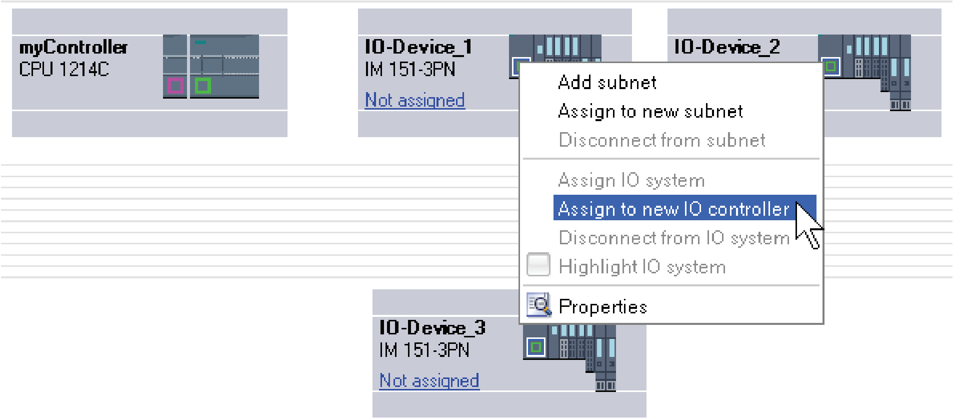
Assign IO devices to an IO system

To do this, follow these steps:

1. Select an appropriate zoom factor so that you can see as many IO devices as possible in the network view.
2. Arrange the IO devices in not more than of two rows.
3. Select all IO interfaces (not all devices) with the mouse cursor. This only works if you begin to drag the mouse cursor outside of the first IO device and release the mouse button at the last IO device (selection with the lasso).



4. Select the shortcut menu "Assign new IO controller" and select the corresponding IO interface of the IO controller in the subsequent dialog.



5. The IO devices are automatically networked with the IO controller and combine with it to form an IO system.

Note

When an IO system is highlighted, you can double-click on an IO device in the hardware catalog and thereby quickly add additional IO devices. Result: The IO device is automatically added to the highlighted IO system.

Interconnecting ports

If an IO device is assigned to an IO controller, this does not yet specify that the ports are connected to each other.

Although a port interconnection is not required to use the PROFINET functions, it does however offer the following advantages:

- A setpoint topology is assigned with the port interconnection. Based on an online-offline comparison, it is possible to conduct a setpoint-actual comparison with all devices that support this function.
- Only with IRT communication: If a port interconnection is configured, STEP 7 can determine the required bandwidth more precisely. As a rule, this leads to a higher performance.

Make sure that no invalid ring structures occur through the interconnection of ports.

Port interconnection is only advisable for devices that support the topology configuration.

Interconnecting ports in the Inspector window

To interconnect ports, follow these steps:

1. Select the PROFINET device or the PROFINET interface.
2. Navigate to the port property "Port interconnection".

   When the PROFINET interface is selected, you can find this setting in the Inspector window as follows: Properties > General > Advanced Options > Port [...] > Port Interconnection.
3. In the "Local port" section, you can find the settings at the local port. In the case of fiber-optic cable you can, for example, set the cable names here.

   In the "Partner port" section, click on the black triangle in the "Partner port" box to display and select the available partner ports.
4. If the port interconnection is a port interconnection with copper as medium and the devices support IRT communication, you can also set cable length and signal transit time.

If the PROFINET interface was not networked, it is automatically networked by this action. In the properties of the subnet you can set whether this subnet should or should not be used for the networking.

Setting the send clock

Shortest possible update interval for send clock

The send clock indicates the time between two consecutive communication cycles. It is the shortest possible transmission interval in data exchange. The update times are calculated as multiples of the send clock cycle.

Requirements to change the send clock at the PROFINET device

No IRT (Isocronous Realtime) should be configured. In detail, this means:

- No device must be configured at the IO system as a sync-slave or sync-master.
- All devices at the IO system must be unsynchronized.

Procedure

To set the send clock, proceed as follows:

1. Select the PROFINET IO controller in the device or network view.
2. Change the value for "Shortest possible update interval for send clock" in the properties of the PROFINET interface under "PROFINET Interface > Advanced options > Realtime settings > IO communication".

The send clock is valid for all PROFINET devices at the IO system. If the synchronization role is set to a value other than "Unsynchronized", you can only set the send clock in the sync domain, in other words, centrally at the PROFINET IO system.

Setting the update time

Update time

An IO device / IO controller in the PROFINET IO system is supplied with new data from the IO controller / IO device within this time period. The update time can be separately configured for each IO device and determines the time interval in which data is transmitted from the IO controller to the IO device (outputs) as well as data from the IO device to the IO controller (inputs).

STEP 7 calculates the update time automatically in the default setting for each IO device of the PROFINET IO system, taking into account the volume of data to be exchanged as well as the set send clock.

Setting the update time

If you do not want to have the update time calculated automatically, you can change the setting.

To change the update time, proceed as follows:

1. Select the PROFINET interface of the IO device in the network or device view.
2. Change the update time in the interface properties under "Advanced options > Realtime settings > IO cycle".
   - To have a suitable update time calculated automatically, select "Automatic".
   - To set the update yourself, select "Can be set" and enter the required update time in ms.
3. To ensure consistency between the send clock and the update time, activate the "Adapt update time when send clock changes" option.

   This option ensures that the update time is not set to less than the send clock.

Non-automatic setting of the send clock may result in errors if the available bandwidth is insufficient or if other limits are exceeded (for example, too many devices are configured).

Setting the watchdog time

Watchdog time

You can configure the watchdog time for PROFINET IO devices.

If the IO device is not supplied with input or output data (IO data) by the IO controller within the watchdog time, it switches to the safe state.

Do not enter the watchdog time directly, but as "Accepted number of update cycles when IO data is missing". This makes setting easier because the update time can be shorter or longer, depending on the power of the IO device or the setting.

The resulting watchdog time is automatically calculated from the "Accepted number of update cycles when IO data is missing".

Configuring the watchdog time

To specify the watchdog time, follow these steps:

1. Select the PROFINET interface of the IO device in the network or device view.
2. In the properties of the interface, navigate to "Advanced options > Realtime settings > IO cycle".
3. Select the required number of cycles from the drop-down list "Trigger watchdog after # cycles with missing IO data".

The watchdog time is subsequently calculated automatically based on the preset factor. It must not be more than 1.92 seconds.

Note

The default setting should only be changed in exceptional cases, for example, during the commissioning phase.

Calculated bandwidth for cyclic IO data

Calculated bandwidth for cyclic IO data

Adherence to the maximum available bandwidth for cyclic IO data is monitored by the system. The maximum bandwidth depends on the send clock cycle. If the send clock cycle is greater than or equal to 1 ms, the maximum bandwidth is 0.5 ms. If the send clock cycle is shorter, the maximum available bandwidth is also reduced.

The bandwidth actually required for cyclic IO data is determined by the system based on the number of configured IO devices and IO modules. Furthermore, the required bandwidth depends on the update time that is used.

In general, the calculated bandwidth increases in the following cases:

- There is a greater number of IO devices
- There is a greater number of IO modules
- The update times are shorter.

Maximum bandwidth for cyclic IO data depending on the send clock

The following table shows how the maximum available bandwidth for cyclic IO data reacts based on the send clock:

Send clock cycle	Maximum bandwidth for cyclic IO data
250 µs – 468.75 µs	<< 125 µs
500 µs – 968.75 µs	= send clock / 2
1 – 4 ms	= 500 µs

Setting port options

Setting the port options

Changing connection settings for the PROFINET IO port

You can change the network settings for the PROFINET IO port as required. By default, the settings are made automatically. In normal situations, this guarantees problem-free communication.

Possible settings for transmission medium/duplex

Depending on the selected device, you can make the following settings for "Transmission medium/duplex":

- Automatic setting

  Recommended default setting of the port. The transmission settings are automatically "negotiated" with the peer port. The "Enable autonegotiation" option is also enabled as a default, in other words, you can use cross cables or patch cables for the connection.

- TP/ITP at x Mbps full duplex (half duplex)

  Setting of the transmission rate and the full duplex/half duplex mode. The effectiveness depends on the "Enable autonegotiation" setting:

  – Autonegotiation enabled

    You can use both cross cable and patch cable.

  – Autonegotiation disabled

    Make sure that you use the correct cable (patch cable or cross cable)! The port is also monitored with this setting.

- Deactivated

  Depending on the module type, the drop down list box can contain the "- Disabled -" option. This option, for example, allows you to prevent access to an unused port for security reasons. With this setting, diagnostic events are not generated.

"Monitor" option

This option is used to activate or deactivate the port diagnostics. Examples of port diagnostics: The link status is monitored, in other words, the diagnostics are generated during link-down and the system reserve is monitored in the case of fiber optic ports.

Option "Enable autonegotiation "

The autonegotiation setting can only be changed if a concrete medium (for example, TP 100 Mbps full duplex) is selected. Whether or not a concrete medium can be set depends on the properties of the module.

If autonegotiation is disabled, this causes the port to be permanently specified, as for example, is necessary for a prioritized startup of the IO device.

You must make sure the partner port has the same settings because with this option the operating parameters of the connected network are not detected and the data transmission rate and transmission mode can accordingly not be optimally set.

Note

When a local port is connected, STEP 7 makes the setting for the partner port if the partner port supports the setting. If the partner port does not accept the setting, an error message is generated.

Wiring rules for disabled autonegotiation

Requirement

You have made the following settings for the port in question, for example, to accelerate the startup time of the IO device:

- Fixed transmission speed
- Autonegotiation incl. autocrossing disabled

This saves you the time required to negotiate the transmission rate during startup.

If you have disabled autonegotiation, you must observe the wiring rules.

Wiring rules for disabled autonegotiation

PROFINET devices have the following two types of ports:

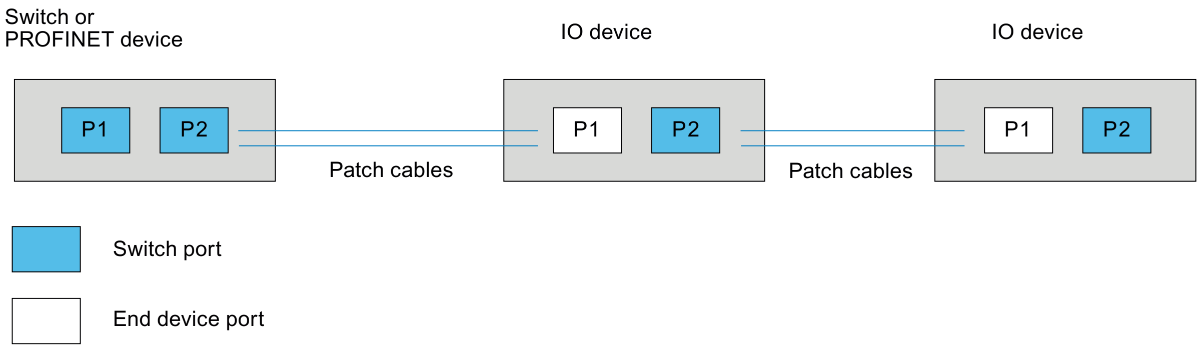
Type of port	PROFINET devices	Note
Switch port with crossed pin assignment	For IO devices: Port 2 For S7 CPUs with 2 ports: Ports 1 and 2	Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is exchanged internally.
End device port with uncrossed pin assignment	For IO devices: Port 1 For S7 CPUs with one port: Port 1	-

Validity of the wiring rules

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting.

Rules for cabling

You can connect several IO devices in line using a single cable type (patch cable). To do this, you connect port 2 of the IO device (distributed I/O) with port 1 of the next IO device. The following graphic gives an example with two IO devices.



Boundaries at the port

Requirements

To use boundaries, the respective device must have more than one port. If the PROFINET does not support boundary settings, they are not shown.

Enable boundaries

"Boundaries" are limits for transmission of certain Ethernet frames. The following boundaries can be set at a port:

- "End of discovery of accessible devices"

  No forwarding of DCP frames to identify accessible devices. Devices downstream from this port cannot be reached by the project tree under "Accessible devices". Devices downstream from this port cannot be reached by the CPU.
- "End of topology discovery"

  LLDP frames (Link Layer Discovery Protocol) are not forwarded for topology detection.
- "End of sync domain"

  No forwarding of sync frames transmitted to synchronize nodes within a sync domain.

  If you operate, for example, a PROFINET device with more than two ports in a ring, you should prevent the sync frame from being fed into the ring by setting a sync boundary (at the ports not inside the ring).

  Additional example: If you want to use several sync domains, configure a sync domain boundary for the port connected to a PROFINET device from the other sync domain.

Restrictions

The following restrictions must be observed:

- The individual check boxes can only be used if the port supports the function in question.
- If a partner port has been determined for the port, the following check boxes cannot be used:
  - "End of discovery of accessible devices"
  - "End of topology discovery"
- If autonegotiation is disabled, none of the check boxes can be used.

Enabling device replacement without exchangeable medium

Replacing an IO device without exchangeable medium

Replacement of IO devices is frequently required in automation systems. The IO devices are generally assigned a device name by either inserting an exchangeable medium or via the programming device. The CPU identifies the IO device by using these device names.

Replacing an IO device can be done without inserting an exchangeable medium (e.g. memory card) or without the programming device, under certain circumstances. For this purpose the Ethernet mechanism analyzes the relationship between the individual IO devices and the IO controller. From these relationships which are stored in the IO controller, the IO controller recognizes which IO device was replaced and assigns a device name to the new device.

Requirements

- A port interconnection is already configured.
- The affected IO devices in the automation system must support device replacement without exchangeable medium.

  If the individual IO devices in the automation system do not support device replacement without exchangeable medium, a corresponding message is output for the IO device.

  Note

  Use only new IO devices as replacements or restore configured IO devices to their delivery state.

Procedure

In order to enable the replacement of an IO device without exchangeable medium, proceed as follows:

1. In the device, select the device or network view of the PROFINET interface in the corresponding IO controller.
2. In the interface properties under "Advanced settings > Interface options", select the "Allow device replacement without exchangeable medium"

See also

Components with the the device replacement without exchangeable medium function (http://support.automation.siemens.com/WW/view/en/36752540)

Using GSDML files

GSD files for IO devices

Basic information on GSD files of IO devices

The properties of PROFINET IO devices are not stored in a keyword-based text file (as for PROFIBUS DP slaves), but in an XML file whose structure and rules are determined by a GSDML scheme.

The language used to describe the GSD files is GSDML (Generic Station Description Markup Language). It is determined by the GSDML scheme. The following sections therefore refer to GSDML files.

A GSDML scheme contains validation rules that allow it, for example, to check the syntax of a GSDML file. GSDML schemes (as scheme files) are acquired by IO device manufacturers from PROFIBUS International.

Functional enhancements in the area of PROFINET IO will have an effect on the GSDML specification and the corresponding scheme. A new version of the specification and of the scheme is created by the functional enhancement.

Names of GSDML files for IO devices

The name of a GSDML file for IO devices can, for example, be as follows:

"GSDML-V1.0-Siemens-ET200S-20030616.xml"

Name component	Explanation
GSDML	String at the start of each GSDML file for IO devices
V1.0	Version of the GSDML scheme
Siemens	Manufacturer
ET200S	Name of the device
20030616	Version code (date)
.xml	File extension

Versioning of GSDML files for IO devices

The version information of GSDML files is in two parts:

First, the version of the GSDML scheme is indicated. This determines the scope of language used by a GSDML file.

This is followed by the version, listed as an issue date. The version of GSDML files is incremented, for example, after troubleshooting or if a functional enhancement was added.

Functional enhancements may result in a new version of the GSDML scheme. A new version of a GSDML scheme might only be supported with restrictions.

Installing the GSDML file

Introduction

A GSDML file (device data file) contains all the IO device properties. If you want to configure an IO device that is not available in the hardware catalog, you must install the GSDML file provided by the manufacturer. IO devices installed via GSDML files are displayed in the hardware catalog and can then be selected and configured.

Requirements

- The hardware and network editor is closed.
- You have access to the required GSDML files in a directory on the hard disk.

Procedure

To install a GSDML file, follow these steps:

1. In the "Options" menu, select the "Install device master data files" command.
2. In the "Install device master data files" dialog box, choose the folder in which you want to save the GSDML files.
3. Choose one or more files from the list of displayed GSD- and GSDML files.
4. Click on the "Install" button.
5. To create a log file for the installation, click on the "Save log file" button.

   Any problems during the installation can be tracked down using the log file.

You will find the new IO devices installed by means of the GSDML files in a new folder in the hardware catalog.

Note

You cannot undo the installation of an GSDML file.

Changing the version of a GSDML file

Changing the revision of a GSD file

You can change the revision of a GSD file for an IO device:

- Only for the current IO device
- All suitable IO devices within the IO system
- All suitable IO devices within the complete project

First, all existing GSD files for the current IO device are shown. The only difference between the GSD files shown is their revision status. The currently used GSD file is highlighted.

Requirements

- The I/O data is the same for all IO devices whose revision is to be changed.
- The order number has not changed.
- The number of submodules is identical.
- The configuration data has not changed.
- There must be no module or submodule in a slot that is invalid after the new GSD file has been created.

Procedure

To change the revision of one or more IO devices, proceed as follows:

1. Select the IO device whose GSD file revision is to be changed.
2. Click on the "Change revision" button under "General> Catalog information" in the properties of the IO device.

   The "Change revision" dialog box opens.
3. Select the GSD revision you want to use in the "Available revisions" table.
4. Under "Use selected revision for", select the devices whose version are to be changed:
   - Only for the current IO device
   - For all suitable IO devices in the IO system
   - For all suitable IO devices in the project
5. Click the "Apply" button.

8.1.4.4 Bus coupling with PN/PN coupler

Application and function

Application

The PN/PN coupler is used to link two Ethernet subnets with one another and to exchange data. That way use data about input or output address areas or datasets can be used. The maximum size of the transferable input and output data is 1024 bytes. The division into input and output data is preferable, so that e.g. 800 byte input data and 200 byte output data can be configured.

As a device, the PN/PN coupler has two PROFINET interfaces, each of which is linked to one subnet.

In the configuration, two IO Devices are produced from this one PN/PN coupler which means that there is one IO Device for each station with its own subnet. The other part of PN/PN coupler in each case is known as the bus node. Once configuring is complete, the two parts are joined.

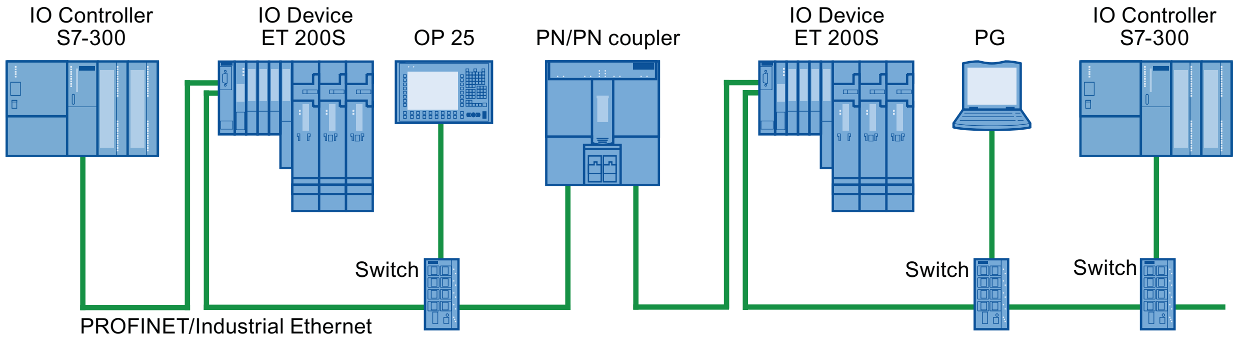


Figure 8-1 Coupling two PROFINET IO subnets with one PN/PN coupler

Additional information

For additional information on "PN/PN couplers", refer to Service & Support on the Internet (http://support.automation.siemens.com/WW/view/en/44319532).

Linking Ethernet subnets

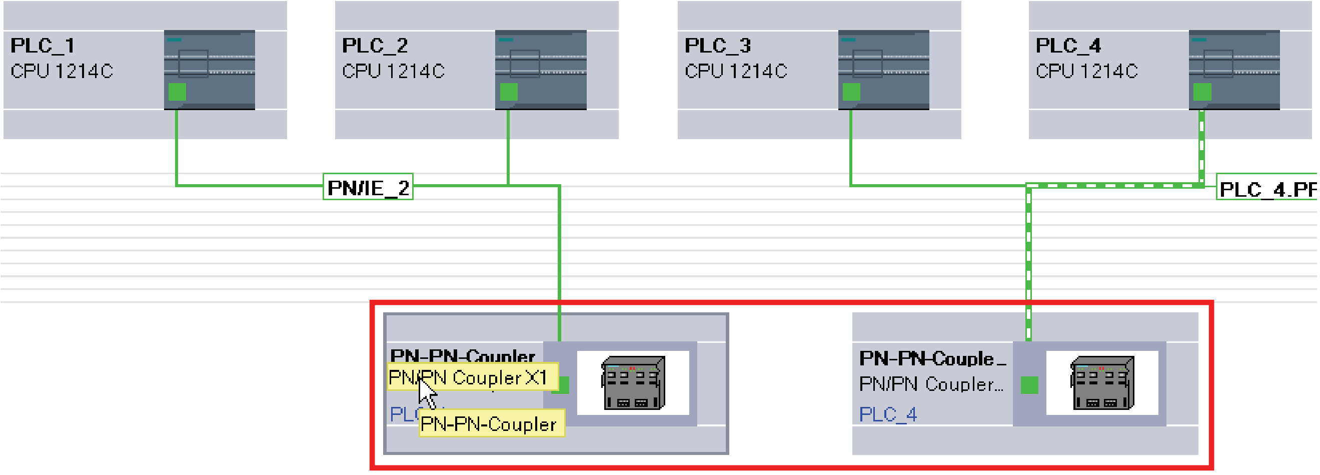
Linking Ethernet subnets with a PN/PN coupler

You can link Ethernet subnets with the standard device PN/PN coupler.

To link Ethernet subnets, follow these steps:

1. Create your Ethernet subnets.
2. Select the standard field devices in the hardware catalog. Find the PN/PN coupler as head module in the "PROFINET IO" folder.
3. In the network view, drag the two components X1 and X2 to the required version of the PN/PN coupler per drag-and-drop operation. The components form a device, but are shown separately to make handling easier.
4. Connect the Ethernet interface of the PN/PN coupler X1 to the first Ethernet subnet.
5. Connect the Ethernet interface of the PN/PN coupler X2 to the second Ethernet subnet.

   The Ethernet subnets are now linked through the two components of the PN/PN coupler.



8.1.4.5 Configurations using external tools

Integrating S7-external tools

Introduction

Tools external to STEP 7 ("Device Tools") with a special call interface (Tool Calling Interface) can be used to configure distributed devices. Such devices are also referred to as "TCI capable".

The performance range of these tools exceeds the possibilities provided within GSD configuration, for example, they can provide expanded graphical input options.

Distributed devices can be as follows:

- PROFIBUS DP slaves
- Modules within a DP slave
- PROFINET IO devices
- Modules within an IO device

Requirements

The call interface of the tool complies with the TCI specification. Parameters and commands are forwarded to the distributed device via this call interface.

Such tools have to be installed using a setup provided by the manufacturer. The "S7-PCT" (Port Configuration Tool) device tool for IO-Link modules is an exception; this is supplied with STEP 7. Special feature: After the installation, the tool is not shown in the list of installed software or in the list of software products in the project.

The GSD or GSDML file of the distributed device, which has to be configured with the device tool, has to be installed.

Starting the device tool

You can find the command to start the device tools as follows:

- Menu command "Edit > Start device tool" in the device view.
- "Start device Tool" in the shortcut menu of a TCI-enabled device.

See also

Example of a device tool (Page 522)

Example of a device tool

Introduction

The "S7-PCT" (Port Configuration Tool) device tool is installed with STEP 7.

The tool is used to assign parameters to the IO link ports of modules such as 4SI IO-Link (ET 200S) or 4IOL+8DI+4DO (ET 200eco PN).

Requirements

You have configured the corresponding DP slave or the corresponding IO device.

Starting S7-PCT

For a ET 200S with 4SI IO-Link, for example, follow these steps:

1. Select the module in the device view.
2. Select "Edit > Start device tool" from the shortcut menu.

   The tool starts and you can configure the ports.

   Alternatively, you can also start from the device view (see next section).

For a ET 200eco PN with 4IOL+8DI+4DO, follow these steps:

1. Select the module in the device view.
2. Arrange the areas in the work area in such a way that the device overview is visible (is located between device view and Inspector window).
3. Select the row with the IO link in the device overview.
4. Select "Edit > Start device tool" from the shortcut menu.

8.1.4.6 Loading a configuration

Introduction to loading a configuration

To start a device, identical configurations must be stored on the PG/PC as well as on the connected devices. Download a configuration to compare the PG/Pc and the connected devices. Configuration data can generally be downloaded in two directions:

- Download configuration from PG/PC in a device
- Download configuration from a device to the PG/PC

See also

Downloading a configuration to a device (Page 523)

Downloading a configuration to the PG/PC (Page 524)

Special features during startup (Page 530)

Downloading a configuration to a device

Downloading the hardware configuration

After you have inserted a new device in the project and configured it or if you have modified an existing hardware configuration, the next step is to load the current configuration on the device. This makes sure that the same configuration is set on the programming device/PC as well as on the physical module.

The first time you load, the entire hardware project data is loaded. When you load again later, only changes to the configuration are loaded.

You have the following options when loading the hardware configuration:

- Loading in the device or network view
- Loading in the project tree
- Loading on an accessible device

> ⚠ WARNING
>
> **Load only in STOP mode**
>
> After loading, you may experience unexpected behaviors on the machine or in the process if the parameter settings are incorrect. The CPU must be set to STOP mode for the download operation to rule out possible damage to equipment or personal injury.

Downloading a configuration to the PG/PC

Introduction

If you have connected a new device to a PG/PC but have not yet inserted the device into the project, you can transfer the complete configuration from the newly connected device to the PG/PC. The device is thereby created in the project.

A device is always downloaded via the list of accessible devices in the project tree. You can download several devices into the project by selecting them accordingly. A configuration can be downloaded several times. A new device is created on each download, even if the device has already been downloaded.

Requirements

- The original hardware configuration must be created in TIA-Portal V11.
- The opened project is in offline mode.

Scope of download

The following list presents an exact overview of the parts of the configuration that are transferred:

- Device parameters

  All set parameters of the module are transferred.
- PROFIBUS master systems and all PROFIBUS-relevant settings

  A DP master system and all connected slaves are inserted into the project. The respective settings remain unchanged. If a suitable PROFIBUS subnet has already been created, the downloaded modules are connected to the PROFIBUS interface at the existing subnet.
- PROFINET IO systems and all PROFINET-relevant settings

  The devices with IO controllers, all IO systems as well as all IO devices are transferred into the project. Settings and topologies are also transferred.

  If there already is a suitable Ethernet network in the project, the downloaded devices are integrated into the existing network.

  Relations between IO controllers and IO devices are only established within the project if both the IO controller as well as the I device are downloaded to the PG. It is unimportant whether you download the IO controller or the I devices first.
- I devices and I slaves

  Master-slave relations between the I slave and assigned DP master are only established in the project if both the master as well as the I slave are downloaded to the PG. It is unimportant whether you download the master system or the I devices and I slaves first. As soon as both devices are downloaded, the connections are also established.

- Direct data exchange

  The configuration of a direct data exchange between two devices can also be downloaded into the project. You must download both partners one after the other to do this.
- S7 connections

  S7 connections are automatically accepted as configured at one end when downloading a device configuration, even if the S7 connection was configured at both ends in the original project. Once both connection partners are downloaded, the connection is once again linked together during the next compiling procedure.
- Bus parameter

  Downloaded bus parameters initially differ from the settings in the original project after downloading a single device. The bus parameters only match those of the original project after all devices involved are downloaded and there are no additional devices on the same bus.
- An I/O module associated with the CPU

  After downloading a CPU, all other modules within the address area of the CPU are also downloaded.

8.1.5 Additional information on configurations

8.1.5.1 Functional description of S7-1200 CPUs

Operating modes

Principles of the operating modes of S7-CPUs

Introduction

Operating modes describe the behavior of the CPU. The following operating modes are possible:

- STARTUP
- RUN
- STOP

In these operating modes, the CPU can communicate via the PN/IE interface, for example.

Other operating modes

If the CPU is not ready for operation, it is in one of following two operating modes:

- Deenergized, i.e. the supply voltage is switched off.
- Defective, which means an internal error has occurred.

  If the "Defective" status is caused by a firmware error, this state is indicated by the status LEDs of the CPU (refer to the description of the CPU). To find out the cause, follow these steps:

  – Turn the power supply switch off and on again.

  – Read out the diagnostics buffer when the CPU starts up and send the data for analysis to Customer Support.

  If the CPU does not start up, replace it.

See also

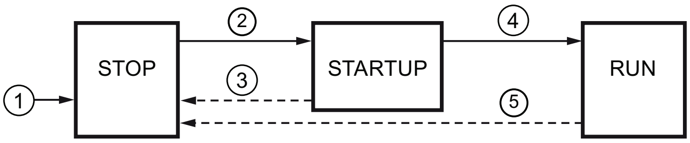
STOP mode (Page 532)

RUN mode (Page 531)

Operating mode transitions

Overview

The following figure shows the operating modes and the operating mode transitions of S7-1200 CPUs:



The following table shows the conditions under which the operating modes will change:

No.	Operating mode transition	Conditions
①	STOP	After you turn on the power supply, the CPU is in "STOP" mode. It then determines the required type of startup and changes to the next operating mode.
②	STOP → STARTUP	If the hardware configuration and the program blocks are consistent, the CPU changes to "STARTUP" mode in the following situations: • The CPU is set to "RUN" from the programming device. • After automatic triggering of a STARTUP operating mode by "POWER-ON".
③	STARTUP → STOP	The CPU returns to the "STOP" mode in the following situations: • An error is detected during startup. • The CPU is set to "STOP" from the programming device. • A STOP command is executed in the STARTUP OB.

No.	Operating mode transition	Conditions
④	STARTUP → RUN	If the STARTUP is successful, the CPU switches to "RUN".
⑤	RUN → STOP	The CPU returns to the "STOP" mode in the following situations: • An error is detected that prevents continued processing. • The CPU is set to "STOP" from the programming device. • A STOP command is executed in the user program.

"STARTUP" operating mode

Principles of the STARTUP mode

Function

After turning on the CPU, it executes a startup program before starting to execute the cyclic user program.

By suitably programming startup OBs, you can specify certain initialization variables for your cyclic program in the startup program. There is no rule in terms of the number of startup OBs. That is, you can set up one or several startup OBs in your program, or none at all.

Parameter settings for startup characteristics

You can specify whether the CPU remains in STOP mode or whether a warm restart is run. Over and above this, you can set the response during startup (RUN or previous mode) in the "Startup" group of the CPU properties.

Special characteristics

Note the following points regarding the "STARTUP" mode:

- The startup OBs are executed. All startup OBs you have programmed are executed, regardless of the selected startup mode.
- No time-based program execution can be performed.
- Interrupt controlled program execution limited to:
  - OB 82 (diagnostics interrupt)
- The outputs on the modules are disabled.
- The process image is not updated; direct I/O access to inputs is possible.

See also

Editing properties and parameters (Page 345)

Principles of the operating modes of S7-CPUs (Page 525)

Organization blocks for startup (Page 573)

Warm restart (Page 528)

Warm restart

Function

During a warm restart, all non-retentive bit memory is deleted and non-retentive DB contents are reset to the initial values from load memory. Retentive bit memory and retentive DB contents are retained.

Program execution begins at the call of the first startup OB.

Triggering a warm restart

You can trigger a "Warm restart" using a corresponding menu command on your programming device in the following situations:

- The CPU must be in "STOP" mode.
- After a memory reset
- After downloading a consistent program and a consistent hardware configuration in the "STOP" mode of the CPU.

"POWER ON" triggers a "warm restart" if you have set the following parameters for the startup response:

- Startup type "warm restart - RUN" (regardless of the CPU operating mode prior to POWER OFF).
- "Warm restart - mode prior to POWER OFF" (depending on the CPU operating mode prior to POWER OFF. The CPU must have been in RUN mode prior to this.)

See also

Retentive memory areas (Page 537)

Startup activities

Overview

The following table shows which activities the CPU performs at STARTUP:

Activities in execution sequence	At warm restart
Clear non-retentive bit memories	Yes
Clear all bit memories	No
Clear the process image output	Yes
Processing startup OBs	Yes
Update the process image input	Yes
Enable outputs after changing to "RUN" mode	Yes

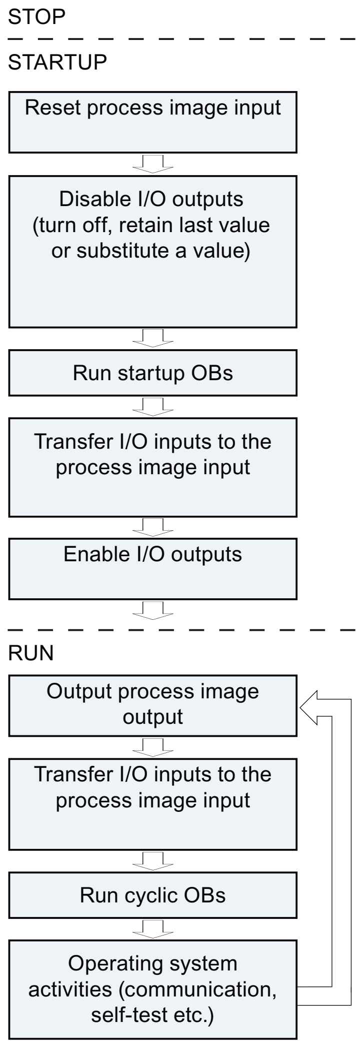
Sequence

The following figure shows the activities of the CPU in "STOP", "STARTUP", and "RUN" modes.

You can use the following measures to specify the state of the I/O outputs in the first cycle of the user program:

- Use assignable output modules to be able to output substitute values or to retain the last value.
- Set default values for outputs in startup OBs.

During the startup, all interrupt events are entered in a queue so that they can be processed later during RUN mode. In RUN mode, hardware interrupts can be processed at any time.



STOP
STARTUP
Reset process image input
Disable I/O outputs (turn off, retain last value or substitute a value)
Run startup OBs
Transfer I/O inputs to the process image input
Enable I/O outputs
RUN
Output process image output
Transfer I/O inputs to the process image input
Run cyclic OBs
Operating system activities (communication, self-test etc.)

Special features during startup

Response when expected and actual configurations do not match

The expected configuration is represented by the engineering configuration loaded on the CPU. The actual configuration is the actual configuration of the automation system.

If the expected configuration and actual configuration differ, the CPU nevertheless initially changes to RUN.

Canceling a STARTUP

If errors occur during startup, the startup is canceled and the CPU remains in "STOP" mode.

Under the following conditions, a startup will not be performed or will be canceled:

- If an invalid SD card is inserted.
- If no hardware configuration has been downloaded.

See also

Overview of the CPU properties (Page 548)

RUN mode

Function

In "RUN" mode the cyclic, time-driven, and interrupt-driven program sections execute:

- The process image output is read out.
- The process image input table is read.
- The user program is executed.

Active data exchange between S7-1200 CPUs by means of Open User Communication is only possible in "RUN" mode.

Running the user program

Once the CPU has read the inputs, the cyclic program runs from the first to the last instruction.

If you have configured a minimum cycle time, the CPU will not end the cycle until this minimum cycle time is up even if the user program is completed sooner.

A maximum cycle time is set which you can adjust according to your requirements. This ensures that the cyclic program is completed within a specified time. The system will respond with a time error if the cyclic program is not completed within this time.

Other events such as hardware and diagnostic interrupts can interrupt the cyclic program flow and prolong the cycle time.

See also

Principles of the operating modes of S7-CPUs (Page 525)

Events and OBs (Page 540)

STOP mode

Function

In "STOP" mode, the user program is not executed. All outputs are disabled or react according to the parameter settings: They provide a substitute value as set in the parameters or retain the last value output and bring the controlled process to a safe status.

The CPU checks the following points:

- Hardware, for example whether are all modules are available
- Whether the default settings for the CPU are applicable or parameter sets are present
- Whether the general conditions for the programmed startup behavior are correct

See also

Principles of the operating modes of S7-CPUs (Page 525)

Basics of a memory reset

Function

A memory reset on the CPU is possible only in STOP mode.

When memory is reset, the CPU is changed to an "initial status". This means:

- The content of the work memory and the retentive and non-retentive data are deleted.
- The load memory (code and data blocks) is then copied to work memory. As a result, the DBs no longer have current values but their initial values.
- An existing online connection between your programming device/PC and the CPU is terminated.
- The diagnostics buffer, the time, the IP address, the hardware configuration and active force jobs are retained.

Memory areas

Things you should know about memory cards

How the memory card functions

The SIMATIC Memory Card for a S7-1200 is an SD memory card preformatted by Siemens for the CPU user program.

You may only delete files and folders. If you format the memory card with Windows, for example with a commercially available card reader, you make the memory card unusable as a storage medium for a S7-CPU.

Setting the card type

You can use the memory card as a transfer card, a program card or a firmware update card.

To set the card type, insert the memory card in the programming device's card reader and select the "SIMATIC card reader" folder from the project navigation. In the properties of the selected memory card, designate the card type:

- Program

  If it is used as a program card, you can load the user program on the memory card. In this case, the internal load memory of the device is replaced by the memory card and the internal load memory is erased. The user program is then fully executable from the memory card. If the memory card with the user program is removed, there is no longer a program available.

- Transfer

  If it is used as a transfer card, you can transfer the user program from the memory card to the internal load memory of the CPU. You can then remove the memory card again.

- Firmware card

  Firmware for the S7-1200 modules can be stored on a memory card. Therefore it is possible to perform a firmware update with the help of a specifically prepared memory card. Likewise, a backup copy of firmware for a module can be stored on a memory card.

Transferring objects from the project to a memory card

When the memory card is inserted in the programming device or in an external card reader, you can transfer the following objects from the project tree to the memory card:

- Individual blocks (multiple selection possible)

  In this case a consistent transfer is available, as the dependencies of the blocks to each other is taken into account with block selection.
- PLC

  In this case, all objects relevant to processing are transferred, such as blocks and the hardware configuration on the memory card, just as with downloading.

To perform a transfer, you can move the objects by dragging and dropping, or use the command "Write to memory card" in the "Project" menu.

Transferring objects from the memory card to the project

You can transfer Individual blocks (multiple selection is possible) by dragging them to the project. A hardware configuration cannot be transferred from the memory card to the project.

Updating firmware with a memory card

You can get the latest firmware data on the internet from the Service & Support pages:

http://support.automation.siemens.com
(http://support.automation.siemens.com/WW/view/en/34143537)

Store the firmware data on the hard drive.

To store the data on the micro memory card, select the command "SIMATIC Card Reader > Create Firmware-Update Memory Card" in the "Project" menu.

Then follow the instructions in the Service & Support portal for performing a firmware update with your CPU.

Updating the firmware changes the CPU firmware status. If you have used the CPU in the project, you will have to update the CPU already configured to the CPU with the new firmware status by changing devices offline, and adapt and then load the program or configuration.

See also

Replacing a hardware component (Page 344)

Load memory

Function

Each CPU has an internal load memory. The size of this internal load memory depends on the CPU used.

This internal load memory can be replaced by using external memory cards. If there is no memory card inserted, the CPU uses the internal load memory; if a memory card is inserted, the CPU uses the memory card as load memory.

The size of the usable external load memory cannot, however, be greater than the internal load memory even if the inserted SD card has more free space.

Work memory

Function

Work memory is a non-retentive memory area for storing elements of the user program that are relevant for program execution. The user program is executed exclusively in work memory and system memory.

System memory

System memory areas

Function

System memory contains the memory elements that each CPU makes available to the user program, such as the process image and bit memory.

By using appropriate operations in your user program, you address the data directly in the relevant operand area.

The following table shows the operand areas of the system memory:

Operand area	Description	Access via units of the following size:	S7 notation
Process image output	The CPU writes the values from the process image output table to the output modules at the start of the cycle.	Output (bit)	Q
		Output byte	QB
		Output word	QW
		Output double word	QD
Process image input	The CPU reads the inputs from the input modules and saves the values to the process image input table at the start of the cycle.	Input (bit)	I
		Input byte	IB
		Input word	IW
		Input double word	ID
Bit memory	This area provides storage for intermediate results	Bit memory (bit)	M
		Memory byte	MB

Operand area	Description	Access via units of the following size:	S7 notation
	calculated in the program.	Memory word	MW
		Memory double word	MD
Data block	Data blocks store information for the program. They can either be defined so that all code blocks can access them (global DBs) or assigned to a specific FB or SFB (instance DB). Requirement: The block attribute "Optimized block access" is not enabled.	Data bit	DBX
		Data byte	DBB
		Data word	DBW
		Data double word	DBD
Local data	This area contains the temporary data of a block while the block is being processed. Requirement: The block attribute "Optimized block access" is not enabled. Recommendation: Access local data (temp) symbolically.	Local data bit	L
		Local data byte	LB
		Local data word	LW
		Local data double word	LD
I/O input area	The I/O input and output areas permit direct access to central and distributed input and output modules.	I/O input bit	<tag>:P
		I/O input byte	
		I/O input word	
		I/O input double word	
I/O output area		I/O output bit	
		I/O output byte	
		I/O output word	
		I/O output double word

Basic principles of process images (Page 537)

Access to the I/O addresses (Page 540)

Retentive memory areas

Retentive memory areas

Data loss after power failure can be avoided by marking certain data as retentive. This data is stored in a retentive memory area. A retentive memory area is an area that retains its content following a warm restart, in other words, after cycling the power when the CPU changes from STOP to RUN.

The following data can be assigned retentivity:

- Bit memory: The precise width of the memory can be defined for bit memory in the PLC tag table or in the assignment list.
- Tags of a function block (FB): You can define individual tags as retentive in the interface of an FB if you have enabled optimized block access. Retentivity settings can be defined only in the assigned instance data block if optimized block access has not been activated for the FB.
- Tags of a global data block: You can define retentivity either for individual or for all tags of a global data block depending on the settings for access.
  - Block with optimized access: retentivity can be set for each individual tag.
  - Block with standard access: The retentivity setting applies to all tags of the DB; either all tags are retentive or no tag is retentive.

See also

Warm restart (Page 528)

process image input/output

Basic principles of process images

Function

When the user program addresses the input (I) and output (O) operand areas, it does not query or change the signal states on the digital signal modules. Instead, it accesses a memory area in the system memory of the CPU. This memory area is referred to as the process image.

Advantages of the process image

Compared with direct access to input and output modules, the main advantage of accessing the process image is that the CPU has a consistent image of the process signals for the duration of one program cycle. If a signal state on an input module changes during program execution, the signal state in the process image is retained until the process image is updated again in the next cycle. The process of repeatedly scanning an input signal within a user program ensures that consistent input information is always available.

Access to the process image also requires far less time than direct access to the signal modules since the process image is located in the internal memory of the CPU.

Updating the process images

Sequence

The operating system updates the process images at cyclic intervals unless defined otherwise in your configuration. The process image input/output is updated in the following order:

1. The internal tasks of the operating system are performed.
2. The process image output (PIQ) table is written to the outputs of the module.
3. The status of inputs is read to the process image input (PII) table.
4. The user program is executed with all the blocks that are called in it.

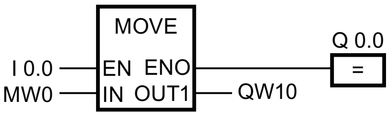
The operating system automatically controls the writing of the process image output to the outputs of the modules and the reading of the process image input.

Special characteristics

You have the option of accessing inputs or outputs directly using direct I/O access.

- If an instruction accesses an output directly and the output address is located in the process image output, the process image of the relevant output is updated.
- If an instruction accesses an output directly and the output address is **not** located in the process image output, the process image of the relevant output is **not** updated.

Example of normal I/O access by way of the process image



Update QW10 in the I/O output area with the value from MW0.

I/O access error during process image updating

If an error occurs while updating the process image (I/O access error), the CPU reacts with the default system reaction "STOP".

See also

Start address of a module (Page 539)

Access to the I/O addresses (Page 540)

Startup activities (Page 529)

Diagnostics buffer

Function

The diagnostics buffer is part of the system memory of the CPU. It contains the errors detected by the CPU or modules with diagnostics capability. It includes the following events:

- Every mode change of the CPU (for example, POWER UP, change to STOP mode, change to RUN mode)
- Every diagnostics interrupt

The diagnostics buffer of the S7-1200-CPU has a capacity of 50 entries of which the last (most recent) 10 entries are retained following power cycling.

Those entries can only be cleared by restoring the CPU to factory defaults.

You can read the content of the diagnostics buffer with the help of the Online and Diagnostics view.

See also

Basic information on the diagnostics buffer (Page 678)

I/O data area

Start address of a module

Definition

The start address is the lowest byte address of a module. It acts as the initial address of the module user data area.

Configuring module start addresses

The addresses used in the user program and the module start addresses are coordinated when the modules are configured.

In the module properties ("I/O addresses" group), you can change the start addresses that were assigned automatically after the modules were inserted.

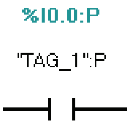
You can also make a setting that decides whether or not the addresses are located in the process image.

Access to the I/O addresses

I/O addresses

If you insert a module in the device view, its user data is located in the process image of the S7-1200-CPU (default). The CPU handles the data exchange between the module and the process image area automatically during the update of the process images.

Append the suffix ":P" to the I/O address if you want the program to access the module directly instead of using the process image.



This could be necessary, for example, during execution of a time time-sensitive program which also has to control the outputs within the same cycle.

Basics of program execution

Events and OBs

Events and OBs

The operating system of S7-1200-CPUs is based on events. There are two types of events:

- Events which can start an OB
- Events which cannot start an OB

An event which can start an OB triggers the following reaction:

- It calls the OB you possibly assigned to this event. The event is entered in a queue according to its priority if it is currently not possible to call this OB.
- The default system reaction is triggered if you did not assign an OB to this event.

An event which cannot start an OB triggers the default system reaction for the associated event class.

The user program cycle is therefore based on events, the assignment of OBs to those events, and on the code which is either contained in the OB, or called in the OB.

The following table provides an overview of the events which can start an OB, including the associated event classes and OBs. The table is sorted based on OB priority. Priority class 1 is the lowest.

Event class	OB no.	Number of OBs	Start event	OB priority
Cyclic program	1, >= 200	>= 1	Starting or end of the last cyclic OB	1
Startup	100, >= 200	>=0	STOP to RUN transition	1
Time-delay interrupt	>= 200	Max. 4	Delay time expired	3
Cyclic interrupt	>= 200		Constant bus cycle time expired	4
Hardware interrupt	>= 200	Max. 50 (more can be used with DETACH and ATTACH)	• Rising edge (max. 16) • Falling edge (max. 16)	5
			• HSC: Count value = reference value (max. 6) • HSC: Count direction changed (max. 6) • HSC: External reset (max. 6)	6
Diagnostic error interrupt	82	0 or 1	Module has detected an error	20
Time error	80	0 or 1	• Maximum cycle time exceeded • Called OB is still being executed • Queue overflow • Interrupt loss due to high interrupt load	26

The following table describes events which do not trigger an OB start, including the corresponding reaction of the operating system. The table is sorted based on event priority.

Event class	Event	Event priority	System reaction
Insert/remove central modules	Insert/remove a module	21	STOP
I/O access error during process image update	I/O access error during process image update	22	Ignore
Programming error	Programming error in a block for which you use system reactions provided by the operating system (note: the error handling routine in the block program is executed if you activated local error handling).	23	STOP
I/O access error	I/O access error in a block for which you use system reactions provided by the operating system (note: the error handling routine in the block program is executed if you activated local error handling).	24	STOP
Maximum cycle time exceeded twice	Maximum cycle time exceeded twice	27	STOP

Assignment between OBs and events

With the exception of the cyclic program and startup program and event can only be assigned to one OB. However, in certain event classes such as hardware interrupts one and the same OB can be assigned to several events.

The assignment between OBs and events is defined in the hardware configuration. Defined assignments can be changed at runtime by means of ATTACH and DETACH instructions.

OB priority and runtime behavior

S7-1200 CPUs support the priority classes 1 (lowest) to 27 (highest). An OB is assigned the priority of its start event.

OBs are always executed on a priority basis: The OBs with the highest priority are executed first. Events of the same priority are processed in order of occurrence. This means:

- Any OB with priority >= 2 will interrupt cyclic program execution.
- An OB of priority 2 to 25 cannot be interrupted by any event of priority group 2 to 25. This rule also applies to events of a priority higher than that of the currently active OB. Such events are processed later.
- A time error (priority 26) will interrupt any other OB.

OB start information

Certain OBs have start information, while others do not. This is explained in greater detail in the description of the relevant OB.

See also

Event-based program execution (Page 542)

Event-based program execution

OB priority and runtime behavior

S7-1200-CPUs support the priority classes 1 (lowest) to 27 (highest). An OB is assigned the priority of its start event.

Interrupt OBs can only be interrupted by time error interrupts. This rule also applies to events of a priority higher than that of the currently active OB. That is, only one interrupt OB can be active, with exception of the time error interrupt OB.

Any further event of generated while an interrupt OB is being executed is added to a queue in accordance with its priority. Start events within a queue are processed later based on the chronological order of their occurrence.

Program execution on the CPU

Cyclic OBs are interrupted by interrupt OBs.

Interrupt OBs can only be interrupted by time error interrupt OBs.

The following figure shows the basic sequence:

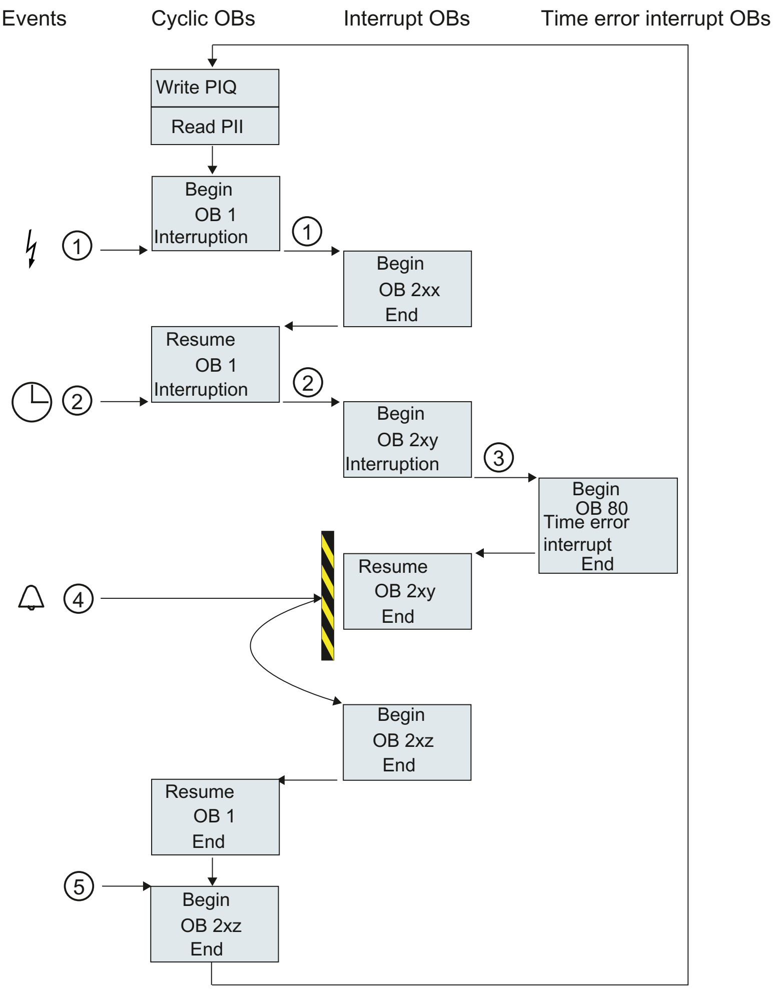


Figure 8-2 Program sequence

Description of program execution

① and ② An event (e.g. a hardware interrupt) calls its associated OB.

A called OB is executed without interruption, including all of its nested blocks. Execution of the cyclic OB is resumed on completion of interrupt processing, provided the queue does not contain any events which trigger an OB start.

③ An interrupt OB can only be interrupted by a time error interrupt OB (OB 80).

④ An new alarm-triggering event occurs during interrupt processing. This new event is added to a queue. The queued events successively call their corresponding OBs only after execution of the current interrupt OBs was completed and according to the following rules:

- Events are processed in the order of their priority (starting at the highest priority)
- Events of the same priority are processed in chronological order

⑤ The cyclic OBs are processed one after the other.

Notes on queues

- Every priority class (OBs of the same priority to be called) is assigned a separate queue. The size of those queues is set by default.
- Any new event leading to the overflow of a queue is discarded and therefore lost. A "time error interrupt event" is generated simultaneously. Information identifying the OB that caused the error is included in the start information of the time error interrupt OB (OB 80). A corresponding reaction such as an alarm trigger can be programmed in the time error interrupt OB.

Example of a hardware interrupt event

The function principle of event-oriented program execution in the S7-1200-CPU is described based on the example of a hardware interrupt-triggering module.

Process events and their priority

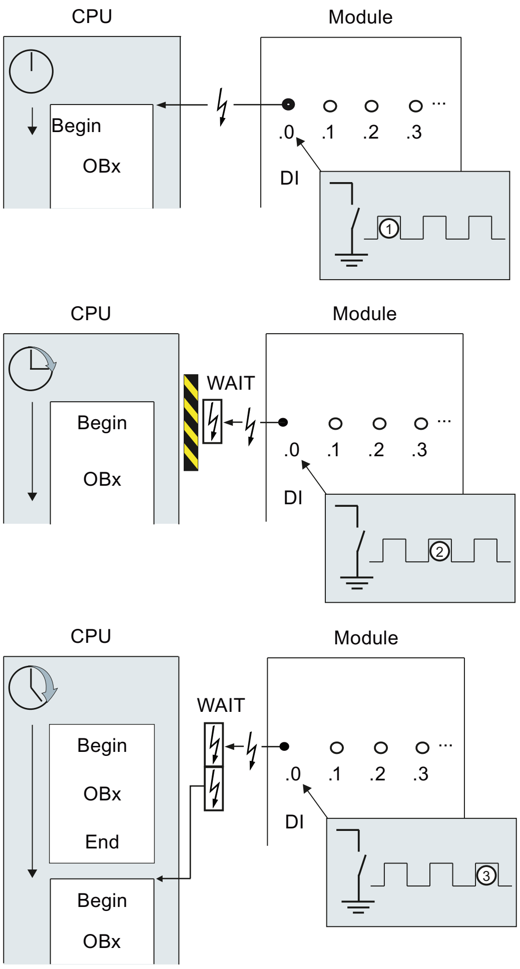
Process events are triggered by the I/O (e.g. at a digital input) and initiate a call of the assigned OB in the S7-1200 CPU. OBs assigned to a hardware interrupt event are so-called hardware interrupt OBs.

Examples of process events and their priority:

- Process events "rising edge" or "falling edge" at an interrupt-triggering module: The hardware interrupt OB started by such an event is always assigned priority 5.
- Process events from a high-speed counter
  - Count value corresponds to the reference value
  - Change count direction
  - External reset of the high-speed counter

    The hardware interrupt OB started by this event is always assigned priority 6.

The following figure shows the sequence of hardware interrupt execution.



Hardware interrupt execution

① A hardware interrupt-triggering event such as a rising edge at the input calls the OB to which it is assigned.

② If a new event occurs that triggers a hardware interrupt while the OB is executing, this event is entered in a queue.

③ The new event that triggers a hardware interrupt starts the hardware interrupt OB assigned to the event.

Assigning the interrupt-triggering event

The interrupt-triggering event is assigned to an OB in the input properties of the device view.

- An interrupt-triggering event can only be assigned to a single OB.
- OBs, however, can be assigned to several interrupt-triggering events.
  That is, you could assign both the rising and the falling edge event to the same interrupt OB in order to trigger the same reaction to any transition of the input signal.
- The started OB can interrupt a cycle OB at every instruction. Consistent data access is secured up to dword size.
- You can parameterize module-specific interrupt-triggering events such as a rising and the falling edge at the input.
- Assign the interrupt-triggering event and the OB to be started in the configuration of the interrupt-triggering module. However, within the started hardware interrupt OB you can override this assignment using the DETACH instruction, or assign the same event to a different OB using the ATTACH instruction. This functionality allows a flexible reaction to external process signals.

Setting the operating behavior

Changing properties of the modules

Default settings

When they leave the factory, all hardware components with parameters have default settings suitable for standard applications. These default values allow the hardware components to be used immediately without making any additional settings.

You can, however, modify the behavior and the properties of the hardware components to suit the requirements and circumstances of your application. Hardware components with settable parameters include, for example, communications modules and several analog and digital modules.

Setting and loading parameters

When you have selected a hardware component in the device or network view, you can set the properties in the Inspector window. When you save a device configuration with its parameters, data is generated that needs to be loaded on the CPU. This data is transferred to the relevant modules during startup.

Properties of the CPUs

The properties of the CPUs have special significance for system behavior. For example for a CPU you can set:

- Interfaces
- Inputs and outputs
- High-speed counters
- Pulse generators
- Startup behavior
- Time-of-day
- Protection level
- Bit memory for system and clock
- Cycle time
- Communications load

The entry possibilities specify what is adjustable and in which value ranges. Fields that cannot be edited are disabled or are not shown in the properties window.

Requirement

You have already arranged the hardware components for which you want to change properties on a rack.

Procedure

To change the properties and parameters of the hardware components, follow these steps:

1. In the device or network view, select the hardware component or interface that you want to edit.
2. Edit the settings for the selected object:
   - For example in the device view you can edit addresses and names.
   - In the Inspector window additional setting possibilities are available.

You do not need to confirm your entries, the changed values will be applied immediately.

CPU properties

Overview of the CPU properties

Overview

The following table provides you with an overview of the CPU properties:

Group	Properties	Description
General	Project information	General information to describe the inserted CPU. Apart from the slot number, you can change all the settings
	Catalog information	Read-only information from the hardware catalog for this CPU.
PROFINET interface	General	Name and comment for this PROFINET interface. The name is limited to 110 characters.
	Ethernet addresses	Select whether the PROFINET interface is networked. If subnets have already been created in project, they can be selected in the drop-down list. If not, you can create a new subnet with the "Add new subnet" button. Information on the IP address, subnet mask, and IP router usage in the subnet is available in the IP protocol. If an IP router is used, the information about the IP address of the IP router is necessary.
	Extended	Name of and comment on the port of the Ethernet interface
	Time-of-day synchronization	Settings for time-of-day synchronization in the NTP time format. The NTP (network time protocol) is a general mechanism for synchronizing system clocks in local and global area networks. In NTP mode, the interface of the CPU sends time queries (in client mode) at regular intervals to NTP servers on the subnet (LAN) and the addresses must be set in the parameters here. Based on the replies from the server, the most reliable and most accurate time is calculated and synchronized. The advantage of this mode is that it allows the time to be synchronized across subnets. The accuracy depends on the quality of the NTP server being used.
DI#/DO#	General	Name of and comment on the integrated digital inputs of the CPU.

Group	Properties	Description
	Digital inputs	Input delays can be set for digital inputs. The input delays can be set in groups (in each case for 4 inputs). The detection of a rising and a falling edge can be enabled for each digital input. A name and a hardware interrupt can be assigned to this event. Depending on the CPU, pulse catches can be activated at various inputs. When the pulse catch is activated, even pulse edges that are shorter than the cycle time of the program are detected.
	Digital outputs	The reaction to a mode change from RUN to STOP can be set for all digital outputs: The state can either be frozen (corresponds to retain last value) or you set a substitute value ("0" or "1")
	I/O/Diagnostic addresses	The address space of the input and output addresses is specified as is the process image. The hardware ID of the device is displayed.
AI#	General	Name of and comment on the integrated analog inputs of the CPU.
	Analog inputs	During noise reduction, the specified integration time suppresses interference frequencies at the specified frequency (in Hz). The channel address, measurement type, voltage range, smoothing, and overflow diagnostics must be specified in the "Channel #" group. The measurement type and voltage range are set permanently to voltage, 0 to 10 V. Smoothing analog values provides a stable analog signal for further processing. Smoothing analog values can be useful with slow measured value changes, for example in temperature measurement. The measured values are smoothed with digital filtering. Smoothing is achieved by the module forming mean values from a specified number of converted (digitalized) analog values. The selected level (slight, medium, strong) decides the number of analog signals used to create the mean value. If overflow diagnostics is enabled, a diagnostics event is generated if an overflow occurs.
	I/O/Diagnostic addresses	The address space of the input addresses is specified as is the process image. The hardware ID of the device is displayed.
High-speed counter (HSC)	High-speed counter (HSC)#	High-speed counters are typically used to drive counting mechanisms. For description and parameter assignment, see: Configuring high-speed counters (Page 559)

Group	Properties	Description
Pulse generators (PTO/PWM)	PTO#/PWM#	A pulse generator is activated and can be initialized with project information. For the parameter assignment of an activated pulse generator, specify the usage as PWM (Pulse Width Modulation) or as PTO (Pulse Train Output). Specify the output source, time base, pulse width format, cycle time, and initial pulse width for PWM. A pulse output is specified as the hardware output. The PWM output is controlled by the CTRL_PWM instruction, see CTRL_PWM. Specify the output source for PTO. A pulse output and a direction output are specified as the hardware outputs. A PTO is operated together with a high-speed counter in the "motion axis" count mode and controlled by the Motion Control technology object, see Auto-Hotspot. The hardware ID is displayed in the I/O-diagnostic addresses and, if the PWM function is selected, the address space of the output addresses and the process image can be selected.
Startup	Startup type	Setting the start up behavior after cycling power. See: Principles of the STARTUP mode (Page 527)
Time-of-day	Local time and daylight-saving time	Setting of the time zone in which the CPU is operated and setting of the daylight-saving/standard time changeover.
Protection	Protection and password for read/write access	Setting options for the level of protection (Page 572)
System and clock memory bits	System memory bits and clock memory bits	You use system memory bits for the following scans: • Is the current cycle the first since cycling power? • Have there been any diagnostics state changes compared with the previous cycle? • Scan for "1" (high) • Scan for "0" (low) Clock memory bits change their values at specified periodic intervals. See: Using clock memory (Page 571)
Cycle time	Maximum cycle time and minimum cycle time.	See: Cycle time and maximum cycle time (Page 552)
Communications load	Maximum allocation of the cycle for communication (as a percentage)	See: Cycle loading by communications (Page 553)
I/O addresses overview	-	Tabular representation of all addresses used by the CPU for integrated inputs/outputs as well as for the inserted modules. Addresses that are not used by any module are represented as gaps. The view can be filtered according to: • Input addresses • Output addresses • Address gaps

Cycle time and maximum cycle time

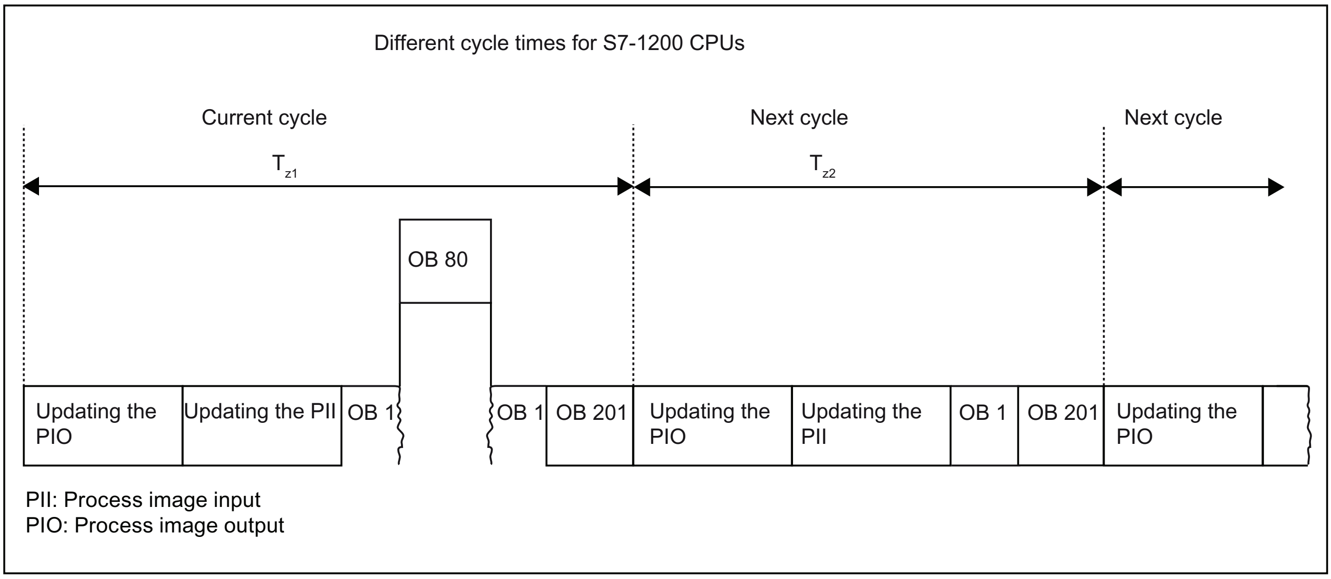
Function

The cycle time is the time that the operating system requires to execute the cyclic program and all the program sections that interrupt this cycle. The program execution can be interrupted by:

- Time errors and 2xMaxCycleTime errors
- System activities, e.g., process image updating

The cycle time (Tcyc) is therefore not the same for every cycle.

The following schematic shows an example of different cycle times (TZ1 ≠ TZ2) for S7-1200 CPUs:



In the current cycle, the cyclic OB used here (e.g. OB 1) will be interrupted by a time error (e.g. OB 80) Following the cyclic OB, the next cycle OB 201 is processed.

Maximum cycle time

The operating system monitors the execution time of the cyclic program for a configurable upper limit known as the maximum cycle time. You can restart this time monitoring at any point in your program by calling the RE_TRIGR instruction.

If the cyclic program exceeds the maximum cycle time, the operating system will attempt to start the time error OB (OB 80). If the OB is not available, the CPU ignores the overshoot of the maximum cycle time.

In addition to monitoring the runtime for overshooting of the maximum cycle time, adherence to a minimum cycle time is guaranteed. To do this, the operating system delays the start of the new cycle until the minimum cycle time has been reached. During this waiting time, new events and operating system services are processed.

If the maximum cycle time is exceeded a second time, for example while the time error OB is being processed (2xMaxCycleTime error), the CPU changes to STOP mode.

Cycle loading by communications

Function

The cycle time of the CPU can be extended due to communications processes. These communications processes include for example:

- Transferring data to another CPU
- Loading of blocks initiated by a programming device

You can control the duration of these communications processes to some extent using the CPU parameter "Cycle load due to communication".

In addition to communications processes, test functions also extend the cycle time. The "Cycle load due to communication" parameter can be used to influence the duration.

How the parameter works

You use the "Cycle load due to communication" parameter to enter the percentage of the overall CPU processing capacity that can be available for communications processes. This CPU processing capacity is now available at all times for communication. This processing capacity can be used for program execution when not required for communication.

Effect on the actual cycle time

The "Cycle load due to communication" parameter can be used to extend the cycle time of the cyclic organization block (e.g., OB 1) by a factor calculated according to the following formula:

$$\frac{100}{100 - \text{"Cycle load due to communication"}}$$

The formula does not take into account the effect of asynchronous events such as hardware interrupts or cyclic interrupts on the cycle time.

If the cycle time is extended due to communication processes, more asynchronous events may occur within the cycle time of the cyclic organization block. This extends the cycle still further. The extension depends on how many events occur and how long it takes to process them.

Example 1 – no additional asynchronous events:

If the "Cycle load due to communication" parameter is set to 50%, this can cause the cycle time of the cyclic organization block to increase by up to a factor of 2.

Example 2 – additional asynchronous events:

For a pure cycle time of 500 ms, a communication load of 50% can result in an actual cycle time of up to 1000 ms, provided that the CPU always has enough communications jobs to process. If, parallel to this, a cyclic interrupt with 20 ms processing time is executed every 100 ms, this cyclic interrupt would extend the cycle by a total of 5*20 ms = 100 ms without communication load. That is, the actual cycle time would be 600 ms. Because a cyclic interrupt also interrupts communications, it affects the cycle time by adding 10 * 20 ms at 50 % communication load. That is, in this case, the actual cycle time amounts to 1200 ms instead of 1000 ms.

Note

Observe the following:

- Check the effects of changing the value of the "Cycle load due to communication" parameter while the system is running.
- You must always consider the communication load when setting the minimum cycle time as time errors will otherwise occur.

Recommendations

- Increase this value only if the CPU is used primarily for communication purposes and the user program is not time critical.
- In all other situations you should only reduce this value.

Time-of-day functions

Basic principles of time of day functions

All S7-1200 CPUs are equipped with an internal clock. The backup supports the display of the correct time for up to 10 hours if the power supply is interrupted.

Time-of-day format

The clock always shows the time of day with a resolution of 1 millisecond and the date including the day of the week. The time adjustment for daylight-saving time is also taken into account.

Setting and reading the time of day

Setting and reading the time with instructions

You can set, start and read the time of day and date on the CPU clock with the following instructions in the user program:

- Set the time of day: "WR_SYS_T"
- Read the time of day "WR_SYS_T"
- Read local time "RD_LOC_T"
- Write local time "WRLT_DTL"

Manual setting

You can also read and set the time of day manually in the online and diagnostics view under "Functions > Set time of day".

Parameterizing the clock

Clock parameters

The clock parameters allow you to make the following settings:

- Enable time-of-day synchronization using an NTP server

  Select this check box if you want the internal clock to be synchronized using the NTP synchronization mode.
- Network time server

  The IP addresses of up to four NTP servers need to be configured.
- Update interval

  The update interval defines the interval between time queries.

High-speed counters

General information on high-speed counters

Introduction

High-speed counters are typically used to drive counting mechanisms in which a shaft turning at a constant speed is equipped with an incremental step encoder. The incremental step encoder ensures a certain number of count values per rotation and a reset pulse once per rotation. The clock memory bit(s) and the reset pulse of the incremental step encoder supply the inputs for the high-speed counter.

The various S7-1200 CPUs have differing numbers of high-speed counters available:

S7-1200 CPU	Number of HSCs	HSC designation
CPU 1211C	3 (with digital signal board 4)*	HSC1…3 (and HSC5)*
CPU 1212C	4 (with digital signal board 5)*	HSC1…4 (and HSC5)*
CPU 1214C	6	HSC1…6

* with DI2/DO2 signal board

How it works

The first of several default values is loaded on the high-speed counter. The required outputs are enabled for the time during which the current value of the counter is lower than the default value. The counter is set up so that an interrupt occurs if the current value of the counter is equal to the default value or when the counter is reset.

If the current value is equal to the default value and an interrupt event results, a new default value is loaded and the next signal state is set for the outputs. If an interrupt event occurs because the counter is reset, the first default value and the first signal states of the outputs are set and the cycle repeated.

Since the interrupts occur much less frequently than the high-speed counter counts, a precise control of the fast operations can be implemented with only a slight influence on the overall cycle of the automation system. Since you can assign specific interrupt programs to interrupts, each new default can be loaded in a separate interrupt program allowing simple control of the state.

Note

You can also process all interrupt events in a single interrupt program.

Count algorithms of the various counters

All counters work in the same way, however some high-speed counters do not support all count algorithms. There are four basic count algorithms:

- Single-phase counter with internal direction control
- Single-phase counter with external direction control
- 2-phase counter with 2 clock inputs
- A/B counter

Each high-speed counter can be used with or without a reset input. If the reset input is activated, this resets the current value. The current value remains reset until the reset input is deactivated.

See also

Configuring high-speed counters (Page 559)

Interdependency of the counter mode and counter inputs (Page 557)

Interdependency of the counter mode and counter inputs

General information on counter mode and counter inputs

You can assign not only the counter modes and counter inputs to the high-speed counters but also functions such as clock pulse generator, direction control, and reset. The following rules apply:

- An input cannot be used for two different functions.
- If an input is not required by the current counter mode of the defined high-speed counter, it can be used other purposes.

If, for example, you set HSC1 to counter mode 1, in which inputs I0.0 and I0.3 are required, you can use I0.1 for edge interrupts or for HSC2.

If, for example, you set HSC1 and HSC5, inputs I0.0 (HSC1) and I1.0 (HSC5) are always used with the counting and frequency counter modes. As a result, these two inputs are not available for any other functions when counters are operated.

You have additional inputs available if you use a digital signal board.

Overview of the interdependency of counter mode and counter inputs

Counter mode	Description	Inputs		
	HSC1	I0.0 (CPU) I4.0 (signal board)	I0.1 (CPU) I4.1 (signal board)	I0.3 (CPU) I4.3 (signal board)
	HSC2	I0.2 (CPU) I4.2 (signal board)	I0.3 (CPU) I4.3 (signal board)	I0.1 (CPU) I4.1 (signal board)
	HSC3*	I0.4 (CPU)	I0.5 (CPU)	I0.7 (CPU)
	HSC4 (CPU 1212/14C only)	I0.6 (CPU)	I0.7 (CPU)	I0.5 (CPU)
	HSC5 (CPU 1214C only)**	I1.0 (CPU) I4.0 (signal board)	I1.1 (CPU) I4.1 (signal board)	I1.2 (CPU) I4.3 (signal board)
	HSC6 (CPU 1214C only)**	I1.3 (CPU)	I1.4 (CPU)	I1.5 (CPU)
Counting / frequency	Single-phase counter with internal direction control	Clock pulse generator		
Counting		Clock pulse generator		Resetting
Counting / frequency	Single-phase counter with external direction control	Clock pulse generator	Direction	
Counting		Clock pulse generator	Direction	Resetting
Counting / frequency	2-phase counter with 2 clock inputs	Clock pulse generator forwards	Clock pulse generator backwards	
Counting		Clock pulse generator forwards	Clock pulse generator backwards	Resetting
Counting / frequency	A/B counter	Clock pulse generator A	Clock pulse generator B	
Counting		Clock pulse generator A	Clock pulse generator B	Resetting
Motion axis	Pulse generators PWM/PTO	HSC1 and HSC2 support the motion axis count mode for the PTO1 and PTO2 pulse generators: • For PTO1, HSC1 evaluates the Q0.0 outputs for the number of pulses. • For PTO2, HSC2 evaluates the Q0.2 outputs for the number of pulses. Q0.1 is used as the output for the motion direction.		

* HSC3 can only be used for CPU 1211 without a reset input

** HSC5 can be also be used for CPU 1211/12 if a DI2/DO2 signal board is used

General information on high-speed counters (Page 556)

Configuring high-speed counters (Page 559)

Configuring high-speed counters

Requirement

An S7-1200 CPU has been inserted in the hardware configuration.

Procedure

To configure a high-speed counter, follow these steps:

1. Select an S7-1200 CPU in the device or network view.
2. Click on the required high-speed counter under "Properties > High-speed counter" in the Inspector window:
   - CPU 1211C: HSC1 to HSC3 (also HSC5 with a DI2/DO2 signal board)
   - CPU 1212C: HSC1 to HSC4 (also HSC5 with a DI2/DO2 signal board)
   - CPU 1214C: HSC1 to HSC6
3. Enable the high-speed counter in the "General" parameter group using the relevant check box.

   Note

   If you use a CPU 1211C or CPU 1212C with a DI2/DO2 signal board, you can also enable the high-speed counter HSC5.

   Note

   If you activate the pulse generators and operate them as PTO1 or PTO2, they use the associated high-speed counter HSC1 or HSC2 with "Motion axis" counting mode to evaluate the hardware outputs. If you configure high-speed counter HSC1 or HSC2 for other counting tasks, these cannot be used by pulse generator PTO1 or PTO2, respectively.

   If required, you can enter a name and a comment for the high-speed counter here.
4. Define the functionality of the high-speed counter in the "Function" parameter group:
   - Count mode: Select what you want to be counted from the drop-down list.
   - Operating phase: Select the count algorithm from the drop-down list.
   - Input source: Select the on-board CPU inputs or the inputs of an optional digital signal board as the input source for the count pulses from the drop-down list.
   - Count direction is specified by: If you have selected a single-phase operating phase, open the drop-down list and select whether the count direction is set internally by an SFB parameter of the user program or externally via a digital input.
   - Initial count direction: If the user program is set as the internal direction control for the count direction, you can select the count direction at the start of counting from the drop-down list.
   - Frequency meter period: If frequency is set as the count mode, you can select the duration of the frequency meter periods in the drop-down list.

5. Specify the initial values and reset condition of the high-speed counter in the "Reset to initial values" parameter group:
   - Initial counter value: Enter a start value for the high-speed counter.
   - Initial reference value: Enter a maximum value for the high-speed counter.

   Here, you can also specify whether the high-speed counter will use a reset input and the set the corresponding signal level for the reset input from the drop-down list.
6. Configure the reaction of the high-speed counter to certain events in the "Event configuration" parameter group. The following events can trigger an interrupt:
   - The counter value matches the reference value.
   - An external reset event was generated.
   - A change of direction was triggered.

   Enable an interrupt reaction using the check box, enter a name and select a hardware interrupt for the interrupt from the drop-down list.
7. Assign the start address for the high-speed counter in the "I/O/Diagnostic addresses" parameter group.

   Note

   In the "Hardware inputs" parameter group, you can only see which hardware inputs and values are being used for the clock, direction determination, reset pulse, and maximum count speed.

Result

You have now adapted the parameters of the high-speed counter to the requirements of your project.

General information on high-speed counters (Page 556)

Interdependency of the counter mode and counter inputs (Page 557)

Point-to-point communication

Overview of point-to-point communication

PtP communication is communication via a serial interface that uses standardized UART data transmission (Universal Asynchronous Receiver/Transmitter). The S7-1200 uses communications modules with an RS-232 or RS-485 interface to establish PtP communication.

Functions of point-to-point communication

Point-to-point communication (PtP) allows numerous applications:

- Direct transmission of information to an external device, for example a printer or a barcode reader
- Reception of information from external devices such as barcode readers, RFID readers, cameras and third-party optical systems as well as many other devices.
- Exchange of information with third-party devices, for example GPS devices, radio modems and many others

The Freeport protocol

The S7-1200 supports the Freeport protocol for character-based serial communication. Using Freeport communication, the data transmission protocol can be configured entirely by the user program.

Siemens provides libraries with Freeport communication functions that you can use in your user program:

- USS Drive protocol
- Modbus RTU Master protocol
- Modbus RTU Slave protocol

Configuring a communications port (Page 562)

Using RS-232 and RS-485 communications modules

Communications modules with RS-232 and RS-485 interfaces

In an S7-1200 CPU, you can use two different communications modules:

- RS-232 communications module
- RS-485 communications module

The communications modules can be connected to the S7-1200 CPU via the I/O channel on the left. You can plug in up to three different modules.

Properties of the communications modules

The communications modules have the following features:

- Support of the Freeport protocol
- Configuration by the user program with the aid of expanded instructions and library functions

Configuring a communications port

Configuring a communications port

After you have inserted a communications module with an RS-232 or RS-485 interface, you then set the interface parameters. You set the parameters for the interface either in the properties of the interface or you control the interface parameters from the user program using the PORT_CFG instruction. The following description relates to the graphic configuration.

Note

If you use the user program to change the port setting, the settings of the graphic configuration are overwritten.

You should also keep in mind that the settings made by the user program are not retained if there is a power down.

Requirement

- A communications module is already plugged in.
- You are in the device view.

Procedure

To configure the communications port, proceed as follows:

1. Select the interface in the graphic representation in the device view.

   The properties of the interface are displayed in the Inspector window.
2. Select the "Port configuration" group in the area navigation of the Inspector window.

   The settings of the port are displayed.
3. From the "Transmission speed" drop-down list, select the speed for the data transmission. With user-programmed communication, remember the influence of the transmission speed on the changeover time.
4. From the "Parity" drop-down list, select the type of detection of bad information words.
5. Using the "Data bits" drop-down list, decide whether a character consists of eight or seven bits.
6. From the "Stop bit" drop-down list, select how many bits will identify the end of a transmitted word.

7. From the "Flow control" drop-down list, select the method for ensuring a trouble-free data stream between sender and receiver. This parameter can only be set for the RS-232 interface.
   – Enter a HEX value in the "XON character" box that will cause the transmission of the message to be continued when it is detected. This parameter can only be set for software-controlled data flow control.
   – Enter a HEX value in the "XOFF character" box that will cause the transmission of the message to be suspended for the set wait time. This parameter can only be set for software-controlled data flow control.
8. In the "Wait time" box, enter a wait time in ms that must be kept to after the end of the message before the next transmission can start.

Note

You can configure the interface in the network view as well. To do so, you must first select the communication module in the tabular network view and then select the interface in the Inspector window. Then you can continue as described above.

Setting data flow control (Page 563)

Setting data flow control

Data flow control

Data flow control is a method that ensures a balanced send and receive behavior. In the ideal situation, the intelligent control does not allow data to be lost. It ensures that a device does not send more information than the receiving partner can process.

There are two methods of data flow control:

- Hardware-controlled data flow control
- Software-controlled data flow control

With both methods, the DSR signals of the communications partners must be active at the beginning of transmission. If the DSR signals are inactive, the transmission is not started.

The RS-232 communications module can handle both methods. The RS-485 communications module does not support data flow control.

Hardware-controlled data flow control

Hardware-controlled data flow control uses the request to send (RTS) and clear to send (CTS) signals. With the RS-232 communications module, the RTS signal is transmitted via the output by pin 7. The CTS signal is received via pin 8.

If hardware-controlled data flow control is enabled, the RTS signal is then always set to activated when data is sent. At the same time, the CTS signal is monitored to check whether the receiving device can accept data. If the CTS signal is active, the module can transfer data until the CTS signal becomes inactive. If the CTS signal is inactive, the data transfer must be suspended for the set wait time. If the CTS signal is still inactive after the set wait time, the data transfer is aborted and an error is signaled back to the user program.

Data flow control using hardware handshaking

If data flow control is controlled by hardware handshaking, the sending device sets the RTS signal to active as default. A device such as a modem can then transfer data at any time. It does not wait for the CTS signal of the receiver. The sending device itself monitors it own transmission by sending only a limited number of frames (characters), for example to prevent overflow of the receive buffer. If there is nevertheless an overflow, the transferring device must hold back the message and signal an error back to the user program.

Software-controlled data flow control

Software-controlled data flow control uses certain characters within the messages and these control the transfer. These characters are ASCII characters selected for XON and XOFF.

XOFF indicates when a transmission must be suspended. XON indicates when a transmission can be continued.

If the sending device receives the XOFF character, it must suspend sending for the selected wait time. If the XON character is sent after the selected wait time, the transfer is continued. If no XON character is received after the wait time, an error is signaled back to the user program.

Software data flow control requires full duplex communication because the receiving partner needs to send the XON character during the ongoing transfer.

See also

Configuring a communications port (Page 562)

Configuration of message transfer

User-programmed communication

You can control the data traffic between a communications module and a device connected externally via the serial interface using your own mechanisms. If you want to do this, you will need to define a communications protocol yourself. In freely programmable communication, ASCII and binary protocols are supported for message transfer.

Within the communications protocol, you will need to specify the criteria by which the start and end of a transferred message can be recognized in the data stream.

User-programmed communication can only be activated in RUN mode. If there is a change to STOP mode, the user-programmed communication is stopped.

Specifying the communications protocol

You can specify the communications protocol as follows:

- With the user program
  - The behavior when sending data is controlled by the SEND_CFG instruction.
  - The behavior when receiving data is controlled by the RCV_CFG instruction.
- Using parameter settings set graphically in the Inspector window

Note

If you change the communications protocol from the user program, the settings of the graphic configuration are overwritten.

You should keep in mind that the settings made by the user program are not retained if there is a power down.

User-programmed communication with RS-232 devices

RS-232/PIP multi-master cable and user-programmed communication with RS-232 devices

Using the RS-232/PIP multi-master cable and user-programmed communication, you can connect a wide variety of RS-232-compliant devices to the communications modules of the S7-1200. The cable must, however, be set to the "PIP/user-programmed communication" mode.

Settings on the cable

The switches on the cable must be set as follows:

- Switch 5 must be set to 0
- Switch 6 sets either the local mode (DCE) or the remote mode (DTE):
  - Switch set to 0 for the local mode
  - Switch set to 1 for the remote mode

Changing over between send and receive mode

The RS-232/PIP multi-master cable is in send mode when data is sent from the RS-232 interface to the RS-485 interface. The cable is in receive mode when it is idle or when data is sent from the RS-485 interface to the RS-232 interface. The cable changes from receive to send mode immediately when it detects characters on the RS-232 send line.

Supported transmission speeds

The RS-232/PIP multi-master cable supports transmission rates between 1200 baud and 115.2 kbaud. The RS-232/PIP multi-master cable can be set to the required transmission rate using the DIP switch on the PC/PIP cable.

The following table shows the switch settings for the various transmission speeds:

Transmission speed	Switchover time	Settings (1 = up)
115200 bps	0.15 ms	110
57600 bps	0.3 ms	111
38400 bps	0.5 ms	000
19200 bps	1.0 ms	001
9600 bps	2.0 ms	010
4800 bps	4.0 ms	011
2400 bps	7.0 ms	100
1200 bps	14.0 ms	101

The cable returns to receive mode when the RS-232 send line is idle for a certain time that is defined as the changeover time of the cable. The set transmission speed influences the changeover time as shown in the table.

Influence of the changeover time

When working with an RS-232/PIP multi-master cable in a system in which user-programmed communication is used, the program must take into account the changeover time for the following reasons:

- The communications module reacts to messages sent by the RS-232 device.

  Once the communications module has received a request from the RS-232 device, it must delay the reaction message for a period that is equal to or longer than the changeover time of the cable.

- The RS-232 device reacts to messages sent by the communications module.

  Once the communications module has received a reaction message from the RS-232 device, it must delay the next request message for a period that is equal to or longer than the changeover time of the cable.

In both situations, the RS-232-PIP multi-master cable has enough time to change from send to receive mode so that the data can be sent from the RS-485 interface to the RS-232 interface.

Specifying the end of the message (Page 569)

Making the settings for sending

Sending messages

You can program pauses between individual messages.

The following table shows which pauses can be set:

Parameter	Definition
RTS ON delay	You can set the time that must elapse after the send request RTS (request to send) before the actual data transfer starts.
RTS OFF delay	You can set the time that must elapse after the complete transfer before RTS signal is deactivated.
Send pause at the start of the message	You can specify that a pause is sent at the start of every message transfer when the RTS ON delay has elapsed. The pause is specified in bit times.
Send Idle Line after a pause	You can make a setting so that following a selected pause at the start of the message, the "Idle Line" signal is output to signal that the line is not in use. To enable the parameter, "Send pause at message start" must be set. The duration of the "Idle Line" signal is specified in bit times.

Specifying the end of the message (Page 569)

User-programmed communication with RS-232 devices (Page 566)

Specifying the start of the message

Recognizing the start of the message

To signal to the receiver when the transfer of a message is completed and when the next message transfer starts, criteria must be specified in the transmission protocol to identify the end and start of a message.

If a criterion is met that indicates the start of a message, the receiver starts searching the data stream for criteria that mean the end of the message.

There are two different methods for identifying the start of a message:

- Starting with any character:

  Any character can defined the start of a message. This is the default method.

- Starting with a specific condition:

  The start of a message is identified based on selected conditions.

Conditions for detecting the start of a message

The following table shows the various options for defining the start of a message:

Parameter	Definition
Recognize start of message by line break	The receiver recognizes a line break when the received data stream is interrupted for longer than one character. If this is the case, the start of the message is identified by the line break.
Recognize start of message by idle line	The start of a message is recognized when the send transmission line is in the idle state for a certain time (specified in bit times) followed by an event such as reception of a character.
Recognize start of message with individual characters	The start of a message is recognized when a certain character occurs. You can enter the character as a HEX value.
Recognize start of message by a character string	The start of a message is detected when one of the specified character sequences arrives in the data stream. You can specify up to four character sequences each with up to five characters.

The individual conditions can be logically linked in any way.

See also

Making the settings for sending (Page 568)

User-programmed communication with RS-232 devices (Page 566)

Specifying the end of the message

Recognizing the end of the message

To signal to the receiver when the transfer of a message is completed and when the next message transfer starts, criteria must be specified in the transmission protocol to identify the end and start of a message.

In total, there are six different methods of recognizing the end of a message and these can all be logically linked in any way. The following table shows the various possible setting options:

Parameter	Definition
Recognize end of message by message timeout	The end of a message is recognized automatically when a selected maximum duration for a message is exceeded. Values from 0 to 65535 ms can be set.
Recognize end of message by reply timeout	The end of a message is recognized when there is no reply within a set time after transferring data. Values from 0 to 65535 ms can be set.

Parameter	Definition
Recognize end of message by timeout between characters	The end of a message is detected when the time between two characters specified in bit times is exceeded. Values from 0 to 2500 bit times can be set. The S7-1200 CPU only accepts a maximum time of eight seconds even if the value that is set results in a duration of more than eight seconds.
Recognize end of message by maximum length	The end of a message is recognized when the maximum length of a message is exceeded. Values from 1 to 1023 characters can be set.
Read message length from message	The message itself contains information about the length of the message. The end of a message is reached when the value taken from the message is reached. Which characters are used for the evaluation of the message length is specified with the following parameters: • Offset of the length field in the message The value decides the position of the character in the message that will be used to indicate the message length. Values from 1 to 1022 characters can be set. • Size of the length field This value specifies how many characters starting at the first evaluation position will be used to indicate the message length. Values of 0, 1, 2 and 4 characters can be set. • The data following the length field (does not belong to the message length) The value specifies the number of bytes after the length field that must be ignored in the evaluation of the message length. Values from 0 to 255 characters can be set.
Recognize message length by a character string	The end of a message is detected when the specified character sequence arrives in the data stream. You can define up to five characters in the character string.

User-programmed communication with RS-232 devices (Page 566)

Using clock memory

Clock memory

A clock memory is a bit memory that changes its binary status periodically in the pulse-no-pulse ratio of 1:1.

You decide which memory byte of the CPU will become the clock memory byte when assigning the clock memory parameters.

Benefits

You can use clock memory, for example, to activate flashing indicator lamps or to initiate periodically recurring operations such as recording of actual values.

Available frequencies

Each bit of the clock bit memory byte is assigned a frequency. The following table shows the assignment:

Bit of the clock memory byte	7	6	5	4	3	2	1	0
Period (s)	2.0	1.6	1.0	0.8	0.5	0.4	0.2	0.1
Frequency (Hz)	0.5	0.625	1	1.25	2	2.5	5	10

Note

Clock memory runs asynchronously to the CPU cycle, i.e. the status of the clock memory can change several times during a long cycle.

The selected memory byte cannot be used for intermediate storage of data.

Enabling system memory

System memory

A system memory is a bit memory with defined values.

You decide which memory byte of the CPU will become the system memory byte when assigning the system memory parameters.

Benefits

You can use system memory in the user program, for example to run program segments in only the first program cycle after start-up. Two system memory bits are constant 1 or constant 0.

Bits of the system memory bytes

The following table shows the meaning of the system memory:

Bit of the system memory bytes	7	6	5	4	3	2	1	0
Meaning	Reserved (=0)	Reserved (=0)	Reserved (=0)	Reserved (=0)	=0	=1	=1 with change to the diagnosis status	=1 in first program cycle after startup, otherwise 0

Note

The selected memory byte cannot be used for intermediate storage of data.

Setting options for the level of protection

Protection level

In the following, you will learn how to use the various protection levels of the S7-1200 CPU.

Effects of the protection level setting

You can choose between the following protection levels:

- No protection: This corresponds to the default behavior. You cannot enter a password. Read and write access is always permitted.
- Write protection: Only read-only access is possible. You cannot change any data on the CPU and cannot load any blocks or a configuration. PLC tags that you have marked as relevant for HMI are excluded from the write protection. Assignment of a password is required to select this protection level.
- Write/read protection No write or read access is possible in the "Accessible devices" area or in the project for devices that are switched online. Only the CPU type and the identification data can be displayed in the project tree under "Accessible devices". Display of online information or blocks under "Accessible devices", or in the project for devices interconnected online, is possible.

  The following objects are excluded from write/read protection:

  – PLC tags that are marked as HMI-relevant

  – Monitorable properties of HMI objects

  Assignment of a password is required to select this protection level.

Behavior of a password-protected CPU during operation

The CPU protection takes effect after the settings are downloaded to the CPU

Before an online function is executed, the necessary permission is checked and, if necessary, the user is prompted to enter a password.

Example: The module was assigned a protection level and you want to execute the "Modify tags" function. This requires write access; therefore, the assigned password must be entered to execute the function.

The functions protected by a password can only be executed by one programming device/PC at any one time. Another programming device/PC cannot log on with a password.

Access authorization to the protected data is in effect for the duration of the online connection, or until the access authorization is manually rescinded with "Online > Delete access rights". Access authorization will also expire when the project is closed.

Note

You can not restrict functions for process control, monitoring, and communications.

Some functions are still protected due to their use as online data. RUN/STOP in the "Online Tools" task card or "Set time of day" in the diagnostics and online editor is therefore write-protected.

Organization blocks

Organization blocks for startup

Description

You can determine the boundary conditions for the startup behavior of your CPU, for example the initialization values for "RUN". To do this, write a startup program. The startup program consists of one or more startup OBs (OB numbers 100 or >= 123).

The startup program is executed once during the transition from "STOP" mode to "RUN" mode. Current values from the process image of the inputs are not available for startup program, nor can these values be set.

After the complete execution of the startup OBs, the process image of the inputs is read in and the cyclic program is started.

There is no time limit for executing the startup program. Therefore the scan cycle monitoring time is not active. Time-driven or interrupt-driven organization blocks cannot be used.

Start information

A startup OB has the following start information:

Tag	Data type	Description
LostRetentive	BOOL	= 1, if retentive data storage areas have been lost
LostRTC	BOOL	= 1, if realtime clock has been lost

See also

Events and OBs (Page 540)

Organization blocks for cyclic program execution

Introduction

For the program execution to start, at least one program cycle OB must be present in the project. The operating system calls this program cycle OB once in each cycle and thereby starts the execution of the user program. You can use multiple OBs (OB numbers >= 123).

The program cycle OBs have the priority class 1. This corresponds to the lowest priority of all OBs. The cyclic program can be interrupted by events of any other event class.

Programming cyclic program execution

You program cyclic program execution by writing your user program in the cycle OBs and the blocks that they call.

The first cyclic program execution begins as soon as the startup program has ended without errors. The cycle restarts after the end of each cyclic program execution.

Sequence of cyclic program execution

One cycle of the program execution encompasses the following steps:

1. The operating system starts the scan cycle monitoring time.
2. The operating system writes the values from the process image output to the output modules.
3. The operating system reads out the state of the inputs of the input modules and updates the process image input.
4. The operating system processes the user program and executes the operations contained in the program.
5. At the end of a cycle, the operating system executes any tasks that are pending, for example, loading and deleting blocks, or calling other cycle OBs.
6. Finally, the CPU returns to the start of the cycle and restarts the scan cycle monitoring time.

See also: process image input/output (Page 537)

Options for interrupting

Cyclic program execution can be interrupted by the following events:

- An interrupt
- A STOP command, triggered by
  - Operation of the programming device
  - "STP" instruction
- Supply voltage failure
- Occurrence of a device fault or program error

Start information

Cycle OBs have no start information.

Events and OBs (Page 540)

Organization blocks for interrupt-driven program execution

Organization blocks for time-delay interrupts

Description

A time-delay interrupt OB is started after a configurable time delay of the operating system. The delay time starts after the SRT_DINT instruction is called.

You can use up to four time-delay interrupt OBs or cyclic OBs (OB numbers >= 123) in your program. If, for example, you are already using two cyclic interrupt OBs, you can insert a maximum of two further time-delay interrupt OBs in your program.

You can use the CAN_DINT instruction to prevent the execution of a time-delay interrupt that has not yet started.

Function of time-delay interrupt OBs

The operating system starts the corresponding OB after the delay time, which you have transferred with an OB number and an identifier to the SRT_DINT instruction.

To use a time-delay interrupt OB, you must execute the following tasks:

- You must call the instruction SRT_DINT.
- You must download the time-delay interrupt OB to the CPU as part of your program.

The delay time is measured with a precision of 1 ms. A delay time can immediately start again after it expires.

Time delay interrupt OBs are executed only when the CPU is in the "RUN" mode. A warm restart clears all start events of time-delay interrupt OBs.

The operating system calls the time-delay interrupt OB if one of the following events occurs:

- If the operating system attempts to start an OB that is not loaded and you specified its number when calling the SRT_DINT instruction.
- If the next start event for a time-delay interrupt occurs before the time delay OB has completely executed.

You can disable and re-enable time-delay interrupts using the DIS_AIRT and EN_AIRT instructions.

Note

If you disable an interrupt with DIS_AIRT after executing SRT_DINT, this interrupt executes only after it has been enabled with EN_AIRT. The delay time is extended accordingly.

Start information

Time delay interrupt OBs have no start information.

See also

Events and OBs (Page 540)

Organization blocks for cyclic interrupts

Description

Cyclic interrupt OBs serve to start program in periodic time intervals independently of the cyclic program execution. The start times of a cyclic interrupt OB are specified using the time base and the phase offset.

The time base defines the intervals at which the cyclic interrupt OB is started and is a whole multiple of the basic clock cycle of 1 ms. The phase offset is the time by which the start time is offset compared with the basic clock cycle. If several cyclic interrupt OBs are being used, you can use this offset to prevent a simultaneous start time if the time bases of the cyclic interrupt OBs have common multiples.

You can specify a time period between 1 ms and 60000 ms.

You can use up to four cyclic interrupt OBs or time-delay OBs (OB numbers >= 123) in your program. If, for example, you are already using two time-delay interrupt OBs, you can insert a maximum of two further cyclic interrupt OBs in your program.

Note

The execution time of each cyclic interrupt OB must be noticeably smaller than its time base. If a cyclic interrupt OB has not been completely executed but execution is again pending because the cycle clock has expired, the time error interrupt OB is started. The cyclic interrupt that caused the error is executed later or discarded.

Example of the use of phase offset

You have inserted two cyclic interrupt OBs in your program:

- Cyclic interrupt OB1
- Cyclic interrupt OB2

For cyclic interrupt OB1, you have set a time base of 20 ms and for cyclic interrupt OB2 a time base of 100 ms. After the expiry of the time base of 100 ms, the cyclic interrupt OB1 reaches the start time for the fifth time, cyclic interrupt OB2 for the first time. To nevertheless execute the cyclic interrupt OBs offset, enter a phase offset for one of the two cyclic interrupt OBs.

Start information

Cyclic interrupt OBs have no start information.

Assigning parameters to cyclic interrupt OBs (Page 583)

Events and OBs (Page 540)

Organization blocks for hardware interrupts

Description

You can use hardware interrupt OBs to react to specific events. You can assign an event that triggers an alarm to precisely one hardware interrupt OB. A hardware interrupt OB in contrast can be assigned to several events.

Hardware interrupts can be triggered by high-speed counters and input channels. For each high-speed counter and input channel that should trigger a hardware interrupt, the following properties need to be configured:

- The process event that should trigger the hardware interrupt (for example, the change of a count direction of a high-speed counter)
- The number of the hardware interrupt OB which is assigned to this process event

You can use up to 50 hardware interrupt OBs (OB numbers >= 123) that are independent of each other in your program.

Function of a hardware interrupt OB

After triggering a hardware interrupt, the operating system identifies the channel of the input or the high-speed counter and determines the assigned hardware interrupt OB.

If no other interrupt OB is active, the determined hardware interrupt OB is called. If a different interrupt OB is already being executed, the hardware interrupt is placed in the queue of its priority class. The hardware interrupt is acknowledged after the completion of the assigned hardware interrupt OB.

If another event that triggers a hardware interrupt occurs on the same module during the time between identification and acknowledgement of a hardware interrupt, the following applies:

- If the event occurs on the channel that previously triggered the hardware interrupt, then no additional hardware interrupt is triggered. Another hardware interrupt can only be triggered if the current hardware interrupt is acknowledged.
- If the event occurs on a different channel, a hardware interrupt is triggered.

Hardware interrupt OBs are called only in the CPU's "RUN" mode.

Start information

Hardware interrupt OBs have no start information.

See also

Assigning parameters to hardware interrupt OBs (Page 581)

Events and OBs (Page 540)

Organization block for time error

Description

The operating system calls the time error interrupt OB (OB 80) if one of the following events occurs:

- The cyclic program exceeds the maximum cycle time.
- The OB called is currently still being executed (possible for time-delay interrupt OBs and cyclic interrupt OBs).
- An overflow has occurred in an interrupt OB queue.
- An interrupt was lost due to the excessive interrupt load.

If you have programmed no time error interrupt OB, the S7-1200 CPU reacts as follows:

- CPUs with firmware version V1.0: The CPU remains in RUN mode.
- CPUs with firmware version V2.0:
  - The CPUs goes to STOP mode when the maximum cycle time is exceeded.
  - With all other start events of the time error interrupt OB, the CPU remains in RUN mode.

With CPUs with firmware version V1.0, the two-time overshooting of the maximum cycle time does not lead to the calling of an OB, but to the STOP of the CPU. You can avoid the second violation by restarting the cycle monitoring of the CPU with the RE_TRIGR instruction.

You can use only one time error interrupt OB in your program.

Start information

The time error interrupt OB has the following start information:

Tag	Data type	Description
fault_id	BYTE	• 0x01: Maximum cycle time exceeded • 0x02: Called OB is still being executed • 0x07: Queue overflow • 0x09: Interrupt loss due to high interrupt load
csg_OBnr	OB_ANY	Number of the OB being executed at the time of the error
csg_prio	UINT	Priority of the OB being executed at the time of the error

See also

Events and OBs (Page 540)

Organization block for diagnostic error interrupts

Description

You can enable the diagnostic error interrupt for diagnostics-capable modules so that the module detects changes in the I/O status. As a result, the module triggers a diagnostic error interrupt in the following cases:

- A fault is present (incoming event)
- A fault is no longer present (outgoing event)

If no other interrupt OB is active, then the diagnostic error interrupt OB (OB 82) is called. If another interrupt OB is already being executed, the diagnostic error interrupt is placed in the queue of its priority group.

You can use only one diagnostic error interrupt OB in your program.

Start information

The diagnostic error interrupt OB has the following start information:

Tag	Data type	Description
IO_state	WORD	Contains the I/O status of the diagnostics-capable module.
laddr	HW_ANY	HW-ID
Channel	UINT	Channel number
multi_error	BOOL	= 1, if there is more than one error

IO_state tag

The following table shows the possible I/O states that the IO_state tag can contain:

IO_state	Description
Bit 0	Configuration correct: = 1, if the configuration is correct = 0, if the configuration is no longer correct
Bit 4	Error: = 1, if an error is present, e.g., a wire break = 0, if the error is no longer present
Bit 5	Configuration not correct: = 1, if the configuration is not correct = 0, if the configuration is correct again
Bit 6	I/O cannot be accessed: = 1, if an I/O access error has occurred In this case, laddr contains the hardware identifier of the I/O with the access error. = 0, if the I/O can be accessed again

Events and OBs (Page 540)

Block parameters of organization blocks

Basics of block parameters

Introduction

Several organization blocks (OBs) have properties with which you can control their behavior or their assignment to specific events. You can influence these properties by assigning parameters.

Overview

You can assign parameters to the properties for the following organization blocks:

- Hardware interrupt OBs
- Cyclic interrupt OBs

See also

Assigning parameters to hardware interrupt OBs (Page 581)

Assigning parameters to cyclic interrupt OBs (Page 583)

Assigning parameters to hardware interrupt OBs

Introduction

You must select the corresponding event and assign the following parameters for every input channel and high-speed counter that should trigger a hardware interrupt:

- Event name
- Number of the hardware interrupt OB that is assigned to this process event

The parameters of the hardware interrupt are assigned in the properties of the corresponding device. You can assign parameters for up to 50 hardware interrupt OBs.

You can create the hardware interrupt OB to be assigned parameters either before or during activation of an event.

Procedure

To assign parameters for the hardware interrupt OB, follow these steps:

1. Double-click the "Devices & Networks" command in the project tree.

   The hardware and network editor opens in the network view.
2. Change to the device view.
3. If the Inspector window closed in the device view, select the "Inspector window" check box in the "View" menu.

   The Inspector window opens.
4. Click the "Properties" tab.
5. In the device view, select the module for which you want to a assign a hardware interrupt.
6. Select the corresponding event.
7. Enter an event name.
8. Select an existing hardware interrupt OB from the "Hardware interrupt" drop-down list.

   Note

   If you have not previously created any hardware interrupt OB, you can click "Add new block" in the drop-down list.

   See also: Creating organization blocks (Page 844)

   ---
9. If you want to assign further hardware interrupts, repeat steps 5 to 8.

Basics of block parameters (Page 581)

Organization blocks for hardware interrupts (Page 578)

Events and OBs (Page 540)

Assigning parameters to cyclic interrupt OBs

Introduction

You can use cyclic interrupt OBs to start programs at regular time intervals. To do so you must enter a scan time and a phase shift for each cyclic interrupt OB used.

You can use up to four cyclic interrupt OBs or time-delay OBs (OB numbers >= 200) in your program. If, for example, you are already using two time-delay interrupt OBs, you can insert a maximum of two further cyclic interrupt OBs in your program.

Note

If you assign multiple cyclic OBs, make sure that you assign a different cycle time or phase offset to each cyclic interrupt OB to avoid them executing at the same time or having to queue. When you create a cyclic interrupt OB, the cycle time 100 and the phase offset 0 are entered as the start values.

Procedure

To enter a scan time and a phase shift for a cyclic interrupt OB, proceed as follows:

1. Open the "Program blocks" folder in the project tree.
2. Right-click on an existing cyclic interrupt OB.
3. Select the "Properties" command in the shortcut menu.

   The "<Name of the cyclic interrupt OB>" dialog box opens.
4. Click the "Cyclic interrupt" group in the area navigation.

   The text boxes for the scan time and the phase shift are displayed.
5. Enter the scan time and the phase shift.
6. Confirm your entries with "OK".

8.1.5.2 Distributed I/O

Distributed I/O systems

SIMATIC ET 200 - The right solution for all applications

SIMATIC ET 200 provides the most varied range of distributed I/O systems.

- Solutions for use in the control cabinet
- Solutions without control cabinet directly at the machine

Additionally, there are also components that can be used in explosive areas. SIMATIC ET 200 systems for construction without a control cabinet are contained in robust, glass-fibre reinforced plastic casing and are therefore shock-resistant, resistant to dirt and watertight.

Their modular design allows the ET 200 systems to be easily scaled and expanded in small steps. Fully-integrated auxiliary modules lower costs and also provide a wide range of possible applications. There are several combination possibilities available:

- Digital and analog I/OS
- Intelligent modules with CPU functions,
- Safety technology,
- Pneumatics,
- Frequency converters
- Various technology modules.

Communication via PROFIBUS and PROFINET, uniform engineering, clear diagnostic possibilities as well as optimal connection to SIMATIC controller and HMI devices vouch for the unique consistency provided by Totally Integrated Automation.

The following table provides an overview of I/O devices for use in the control cabinet:

I/O device	Properties
ET 200S	• Highly modular design with multiple conductor connections • Multifunctional due to a wide range of modules • Use in explosive areas (Zone 2)
ET 200S COMPACT	• Highly modular design with multiple conductor connections • Multifunctional due to a wide range of modules • Use in explosive areas (Zone 2) • Integrated DE/DA
ET 200L	• Cost-effective digital block I/OS • Digital electronic blocks up to 32 channels
ET 200M	• Modular design with standard modules from SIMATIC-S7-300 • Failsafe I/O modules • Use in explosive areas up to Zone 2, sensors and actuators up to Zone 1 • High level of plant availability, for example by plugging and unplugging when in operation
ET 200iSP	• Modular design, also possible with redundancy • Robust and intrinsically safe design • Use in explosive areas up to Zone 1/21; sensors and actuators even up to Zone 0/20 • High level of plant availability, for example by plugging and unplugging when in operation

The following table provides an overview of I/O devices for use without a control cabinet:

I/O device	Properties
ET 200pro	• Modular design with compact housing • Easy assembly • Multifunctional due to a wide range of modules • High level of availability due to plugging and unplugging in operation and permanent wiring • Comprehensive diagnostics
ET 200eco PN	• Cost-efficient, space-saving block I/OS • Digital modules up to 16 channels (also configurable) • Analog modules, IO-link master and load voltage distributor • PROFINET connection with 2-port switch in each module • Can be flexibly distributed via PROFINET in line or star shape directly within the plant
ET 200eco	• Cost-effective digital block I/OS • Flexible connection possibilities • Failsafe modules • High level of plant availability
ET 200R	• Specially for use on robots • Assembled directly on the chassis • Resistant to weld spatter due to robust metal housing

ET 200iSP

ET 200iSP Distributed I/O Station

Definition

The ET 200iSP distributed I/O station is a highly modular and intrinsically safe DP slave with degree of protection IP 30.

Area of application

The ET 200iSP distributed I/O station can be operated in potentially explosive atmospheres characterized by gas and dust:

Approval	ET 200iSP Station*	Inputs and outputs
ATEX	Zone 1, Zone 21	up to Zone 0, Zone 20 **
IECEx	Zone 2, Zone 22	up to Zone 0, Zone 20 **
* In combination with an appropriate enclosure ** for electronic module 2 DO Relay UC60V/2A: up to Zone 1, Zone 21		

The ET 200iSP distributed I/O station can, of course, also be used in the safety area.

You can insert almost any combination of ET 200iSP I/O modules directly next to the interface module that transfers the data to the DP master. This means you can adapt the configuration to suit your on-site requirements.

Every ET 200iSP consists of a power supply module, an interface module and a maximum of 32 electronic modules (for example digital electronics modules). Remember not to exceed the maximum current consumption.

Terminal modules and electronic modules

In principle, the ET 200iSP distributed I/O station consists of various passive terminal modules onto which you plug the power supply and the electronic modules.

The ET 200iSP is connected to PROFIBUS RS 485-IS by means of a connector on terminal module TM-IM/EM. Every ET 200iSP is a DP slave on the PROFIBUS RS 485-IS.

DP master

All ET 200iSP modules support communication with DP masters that are compliant with *IEC 61784-1:2002 Ed1 CP 3/1* and operate with "DP" transmission protocol (DP stands for distributed peripherals or distributed I/O).

Assigning the channel and IEEE tag

Properties

Analog electronic modules 4 AI I 2WIRE/HART, 4 AI I 4WIRE/ HART and 4 AO I HART support up to four IEEE tags.

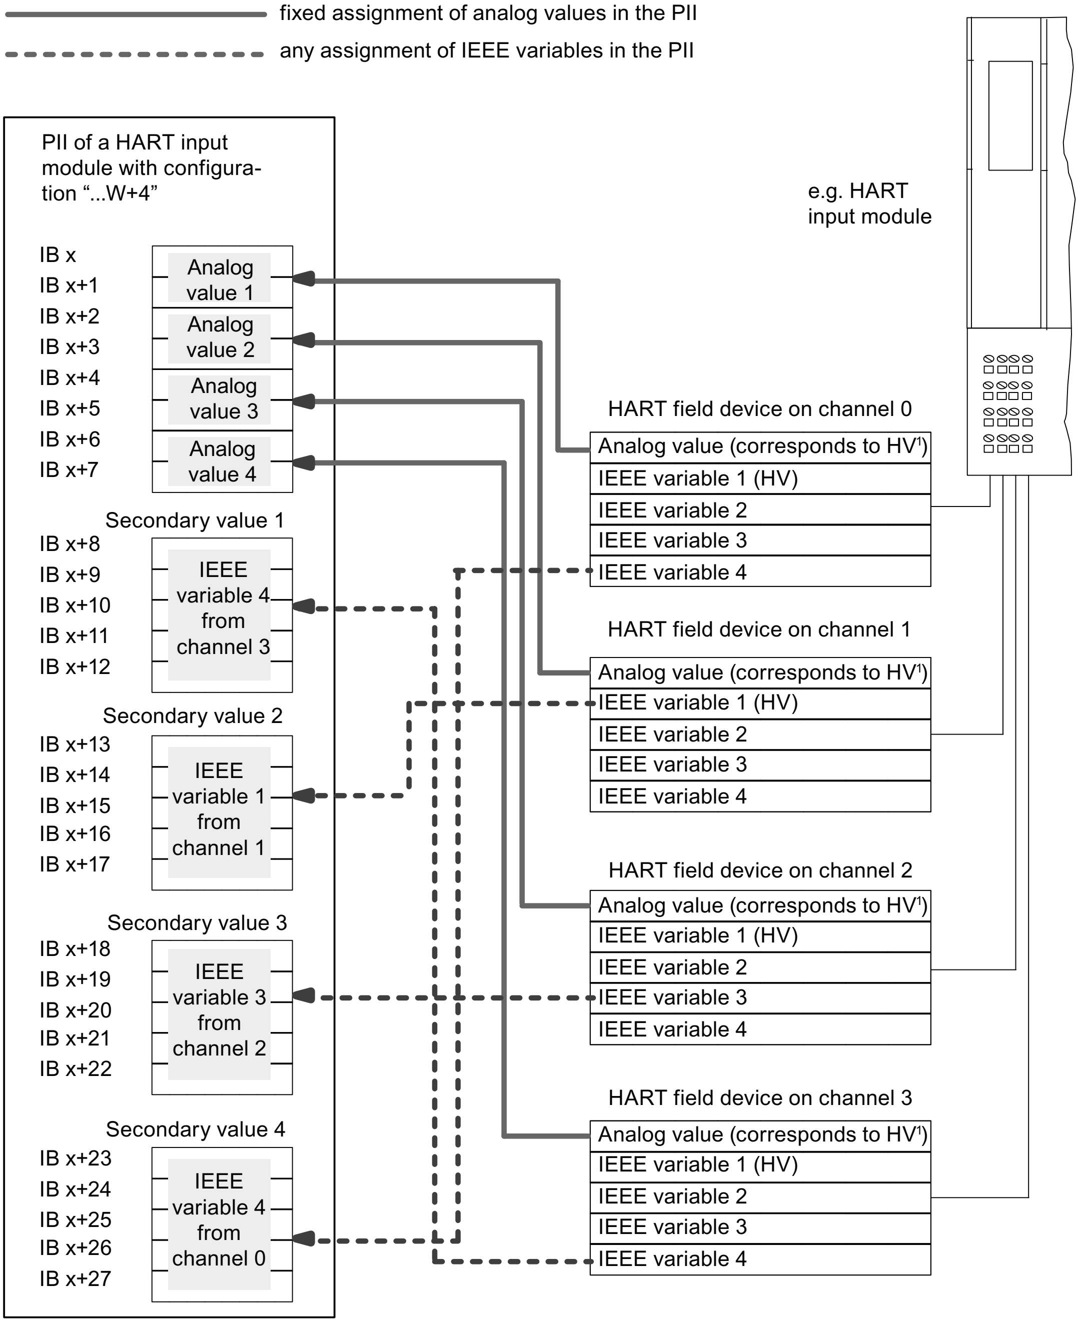
The process input image (PII) provides up to 20 bytes per module for the IEEE tags. Thus, four blocks of 5 bytes each are available for the four IEEE tags within the PII.

Requirements

The HART field device must support the assigned number of IEEE tags.

Assigning IEEE tags

You assign the IEEE tags of the field devices to any one of the four blocks in the PII.



[1] HV = main variable

Assigning parameters to reference junctions for thermocouples

Compensation of the reference junction temperature

There are various ways of obtaining the reference junction temperature in order to get an absolute temperature value from the temperature difference between the reference junction and the measuring point.

Table 8- 1 Compensation of the reference junction temperature

Option	Explanation	Reference junction parameters
No compensation	You record not only the temperature of the measurement point. The temperature of the reference junction (transition from Cu line to thermocouple line) also affects the thermo-electromotive force. The measured value then includes an error.	None
Use of a Pt100 Climatic Range resistance thermometer to record the reference junction temperature (best method)	You can record the reference junction temperature using a resistance thermometer (Pt100 Climatic Range). If parameterized accordingly, this temperature value is distributed to the 4 AI TC modules in the ET 200iSP where it is offset against the temperature value obtained at the measuring location. Number of reference junctions: 2	The parameter assignment of the IM 152 and the 4 AI TC must be coordinated: • 4 AI RTD assigned parameters for Pt100 climatic range in correct slot; • 4 AI TC: Reference junction : "yes"; select reference junction number "1" or "2" • IM 152-1:Assignment of the reference junction to a slot with 4 AI RTD; channel selection;
Internal compensation 4 AI TC	The TC sensor module (temperature sensor) is mounted onto the terminals of terminal module EM 4 AI TC. The temperature sensor reports the temperature of the terminals to the 4 AI TC. This value is then calculated together with the measured value from the channel of the electronic module.	• 4 AI TC: Reference junction number "internal"

Compensation by means of a resistance thermometer at the 4 AI RTD

If thermocouples that are connected to the inputs of the 4 AI RTD have the same reference junction, compensate by means of a 4 AI RTD.

For both channels of the 4 AI TC module, you can select "1", "2" or "internal" as the reference junction number. If you select "1" or "2", the same reference junction (RTD channel) is always used for all four channels.

Setting parameters for the reference junction

You set the reference junctions for the 4 AI TC electronic modules by means of the following parameters:

Table 8- 2 Reference junction parameters

Parameter	Module	Range of values	Explanation
Slot reference junction 1 to slot 2	IM 152	none, 4 to 35	With this parameter, you can assign up to 2 slots (none, 4 to 35), on which the channels for reference temperature measurement (calculating the compensation value) are located.
Input reference junction 1 to 4 input reference junction	IM 152	RTD on channel 0 RTD on channel 1 RTD on channel 2 RTD on channel 3	This parameter allows you to set the channel (0/1/2/3) for measuring the reference temperature (calculation of the compensation value) for the assigned slot.
Reference junction E0 to reference junction E3	4 AI TC	None yes	This parameter allows you to enable the use of the reference junction.
Reference junction number	4 AI TC	1 2 Internal	This parameter allows you to assign the reference junction (1, 2) that contains the reference temperature (compensation value).

Fundamentals of Time Stamping

Properties

Time stamping is possible with the IM 152 in customer applications using FB 62 (FB TIMESTMP).

Principle of operation

A modified input signal is assigned a time stamp and stored in a buffer (data record). If time stamped signals exists or a data record is full, a hardware interrupt is generated to the DP master. The buffer is evaluated with "Read data record". Special messages are generated for events that influence the time stamping (communication with the DP master interrupted, frame failure of time master, ...).

Parameter Assignment

With the parameter assignment you define which IM 152 user data will be monitored. For the time stamping these are digital inputs that are monitoring for signal changes.

Parameter	Setting	Description
Time stamping	• disabled • enabled	Activate the time staming for the channels of the electronics module 8 DI NAMUR.
Edge evaluation incoming event	• rising edge • falling edge	Determine the type of signal change that will be time-stamped.

Counting

Count properties

Counting functions

The 8 DI NAMUR electronics module has configurable counting functions:

- 2 x 16-bit up counters (standard counting function) or
- 2 x 16-bit down counters (standard counting function) or
- 1 x 32-bit down counter (cascading counter function)
- Setting a setpoint with the PIQ
- GATE function
- You can configure the control signals of the counters:
  - Configuration channel 0..1: "Counter", channel 2..7: "DI": Two counters are configured. The control signals of the counters are stored in the PIQ (process image output).
  - Configuration channel 0..1: "Counter", channel 2..7: "Control": Two counters are configured. The control signals of the counters are stored in the PIQ (process image output). They are also controlled by the digital inputs of the 8 DI NAMUR.

See also

Principle of operation (Page 597)

Configuring counters (Page 599)

Assigning parameters to counters (Page 602)

Principle of operation

16-bit up counters (standard counting function)

The counting range is 0 to 65,535.

With each count pulse at the digital input, the count is incremented by 1. Once the count limit is reached, the counter is reset to 0 and it counts up again from this value.

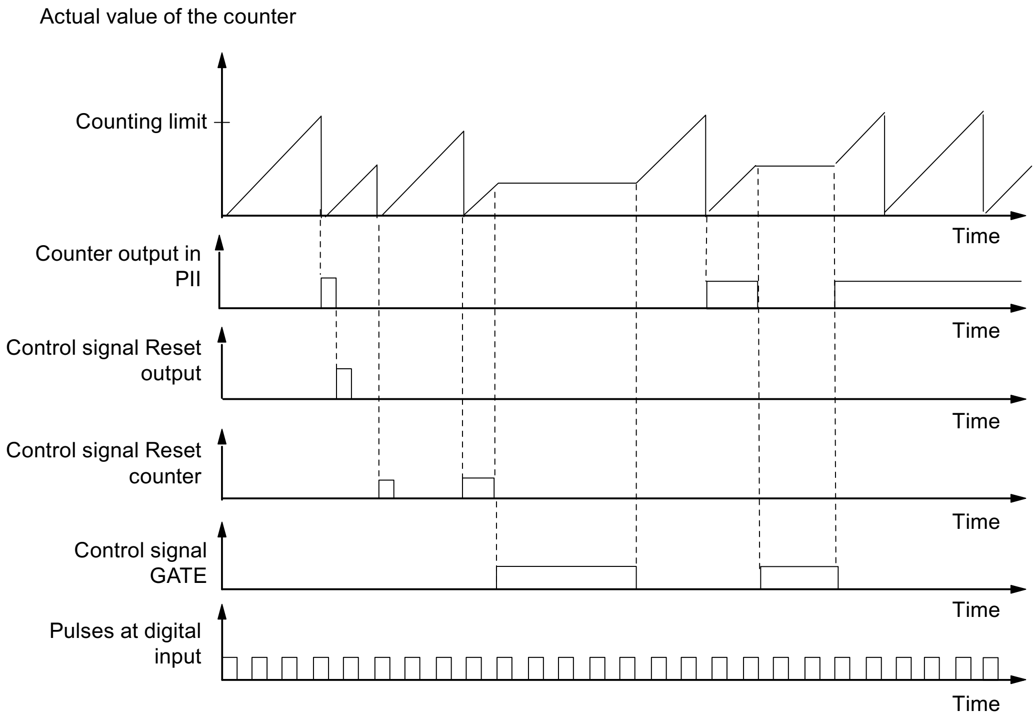
If there is counter overflow, the corresponding output is set in the PII.

A positive edge of the *Reset output* control signal resets the output in the PII. This does not affect the current count value.

In 16-bit up counting operations, the system does not set any outputs in the PIQ. These are always reset.

The positive edge of the *Reset counter* control signal sets the counter to 0 and resets the set counter output.

The *GATE* control signal pauses the counting on a positive edge. Count pulses are processed at the digital input again, but only at the negative edge. The *Reset counter* control signal is also effective when *GATE* is active.



16-bit down counters (periodic counting function)

The maximum counting range is always 65,535 to 0.

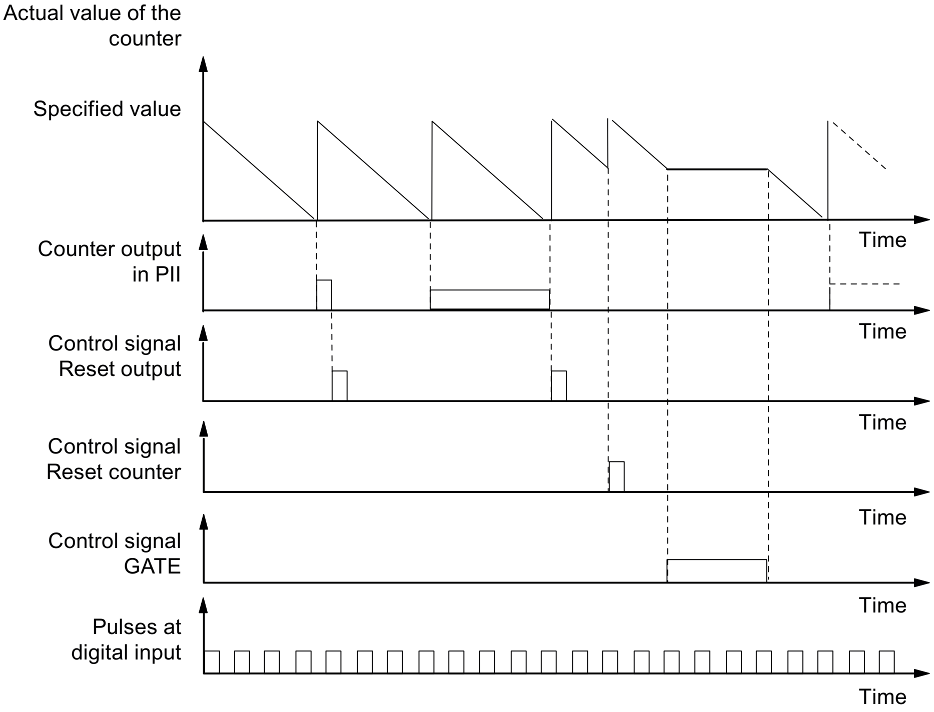
When the counter is started, the actual value is set to the selected setpoint. Each counted pulse reduced the actual value by 1. Once the actual value reaches 0, the corresponding output in the PII is turned on and the actual value is set to the selected setpoint. The counter then counts down from this value.

The positive edge of the *Reset counter* control signal resets the selected setpoint and the corresponding output in the PII.

A positive edge of the *Reset output* control signal resets the output in the PII. This does not affect the current count value.

The *GATE* control signal pauses the counting on a positive edge. At the same time, the assigned output in the PII is reset. Count pulses are processed at the digital input again, but only at the negative edge. The *Reset output* and *Reset counter* control signals are also effective when *GATE* is active.

The setpoint of the counter is set and changed using the PIQ. The setpoint is adopted on a positive edge of the *Reset counter* control signal or when the counter has reached zero.



32-bit down counter (cascading counter function)

The maximum counting range is always 4294967295 to 0.

The principle of operation is identical to that of the 16-bit down counter. Channel 1 has no function.

Count properties (Page 596)

Configuring counters

Procedure

1. Using the mouse, pull module 8 DI Namur from the hardware catalog into distributed I/O station ET 200iSP.
2. Select the required configuration (channel 0..1: "Counter", channel 2..7: "DI" or "Control"). In the module properties (inspector window), you can find this setting under "Parameters > Inputs > Configuration".

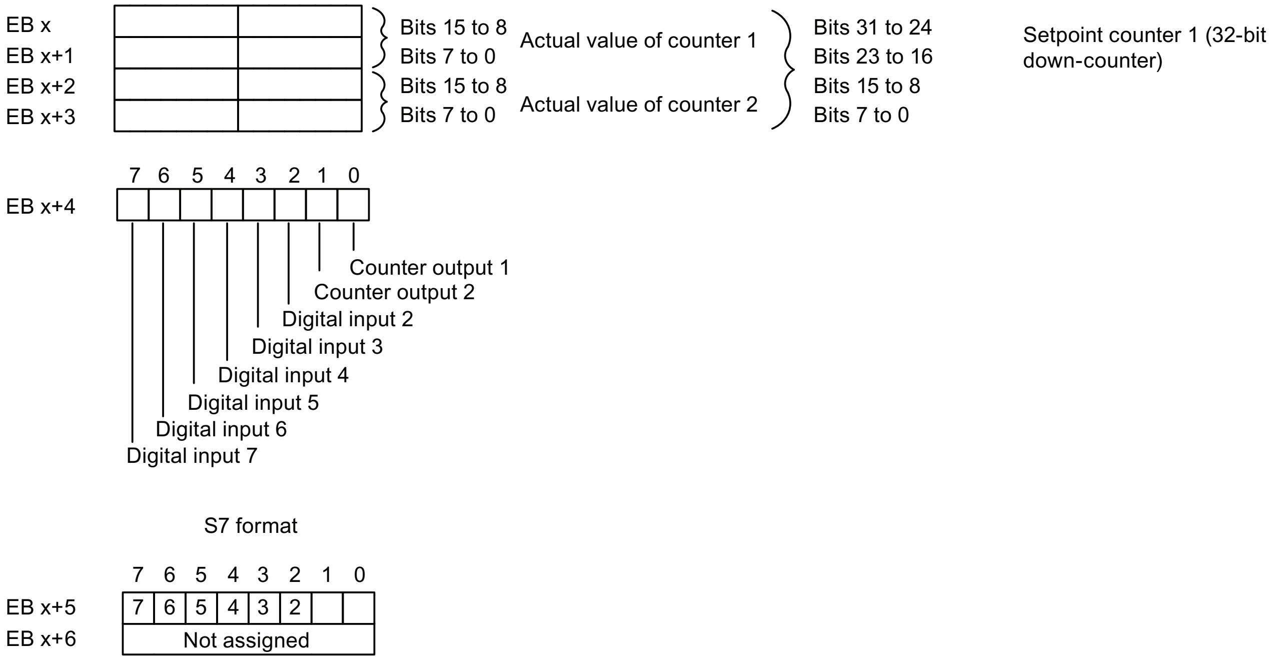
Configuration channel 0..1: "Counter", channel 2..7: "DI"

- Assignment of the digital inputs on the electronic module 8 DI NAMUR

Table 8- 3 Assignment of digital inputs for channel 0..1: "Counter", channel 2..7: "DI":

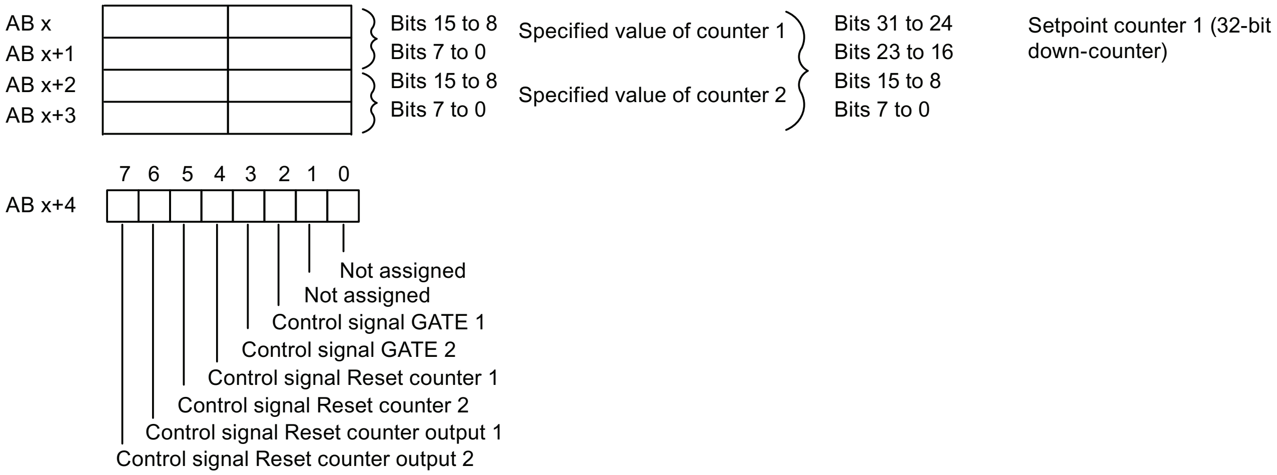
Digital input	Terminal	Assignment
Channel 0	1, 2	Counter 1
Channel 1	5, 6	Counter 2 (does not apply to 32-bit down counters)
Channel 2	9, 10	Digital input 2
Channel 3	13, 14	Digital input 3
Channel 4	3, 4	Digital input 4
Channel 5	7, 8	Digital input 5
Channel 6	11, 12	Digital input 6
Channel 7	15, 16	Digital input 7

- Assignment of the process image input (PII)



Value status for channels 2 to 7:
1_B: Input signal is valid
0_B: Input signal is invalid

- Assignment of the process image output (PIQ)



AB x
AB x+1
AB x+2
AB x+3
Bits 15 to 8
Bits 7 to 0
Specified value of counter 1
Bits 15 to 8
Bits 7 to 0
Specified value of counter 2
Bits 31 to 24
Bits 23 to 16
Bits 15 to 8
Bits 7 to 0
Setpoint counter 1 (32-bit down-counter)
7 6 5 4 3 2 1 0
AB x+4
Not assigned
Not assigned
Control signal GATE 1
Control signal GATE 2
Control signal Reset counter 1
Control signal Reset counter 2
Control signal Reset counter output 1
Control signal Reset counter output 2

Configuration channel 0..1: "Counter", channel 2..7: "CONTROL"

With this configuration, you can also control the counters over the digital inputs.

- Assignment of the digital inputs on electronic module 8 DI NAMUR

  For further information on input assignments, refer to the technical data for electronic module 8 DI NAMUR.

Table 8- 4 Assignment of the digital inputs for 2 Count/ 6 Control

Digital input	Terminal	Assignment
Channel 0	1, 2	Counter 1
Channel 1	5, 6	Counter 2 (does not apply to 32-bit down counters)
Channel 2	9, 10	control signal *GATE 1*
Channel 3	13, 14	control signal *GATE 2*
Channel 4	3, 4	control signal *Reset counter 1*
Channel 5	7, 8	control signal *Reset counter 2*
Channel 6	11, 12	control signal *Reset counter output 1*
Channel 7	15, 16	control signal *Reset counter output 2*

- Assignment of the process image input (PII)

  Assignment is identical to configuration 0..1: "Counter", channel 2..7: "DI".

- Assignment of the process image output (PIQ)

  Assignment is identical to configuration 0..1: "Counter", channel 2..7: "DI".

Count properties (Page 596)

Assigning parameters to counters

Parameters for the counting function

Only those parameters that are relevant for the counters are explained below. These belong to the parameters of electronic module 8 DI NAMUR and depend on the selected configuration:

Table 8- 5 Parameters for the counters

Parameter	Setting	Description
Sensor type counter inputs	• Channel disabled • NAMUR sensor • Single contact, no load resistance	Select the sensor for the respective counter of channels 0 or 1.
Mode for counter 1	• Standard counting function • Periodic counting function • Cascaded counting function	Select the mode for counter 1.
Mode for counter 2	• Standard counting function • Periodic counting function • Cascaded counting function	Select the mode for counter 2. This parameter is not relevant if you have set the "Mode for counter 1" parameter to "Cascaded counter function".

Count properties (Page 596)

Frequency measurement

Frequency measurement properties

Properties

The electronic module 8 DI NAMUR allows the frequencies to be measured on channel 0 and 1:

- 2 frequency meters from 1 Hz to 5 kHz
- Configurable metering window (GATE)
- The signals of the frequency meter are read in by means of the digital inputs of the electronic module.

See also

Principle of operation (Page 603)

Configuring frequency meters (Page 603)

Assigning parameters for the frequency meters (Page 605)

Principle of operation

Frequency measurement

The signal frequencies are identified from the input signals of channel 0 or 1 of the electronic module. To calculate the frequency the signals are measured within a configurable gate.

The frequency is displayed as 16-bit value in fixed-point format and transferred to the PII.

The frequency meter calculates the frequency according to the follow formula:

$$\text{Frequency [Hz]} = \frac{\text{Number of rising edges at digital input}}{\text{Measuring window [s]}}$$

Exceeding the input frequency

If the input frequency exceeds 5kHz, $7FFF_H$ is reported as actual value. If the input frequency is above approx. 8 kHz it is no longer possible to display correct actual values.

See also

Frequency measurement properties (Page 602)

Configuring frequency meters

Procedure

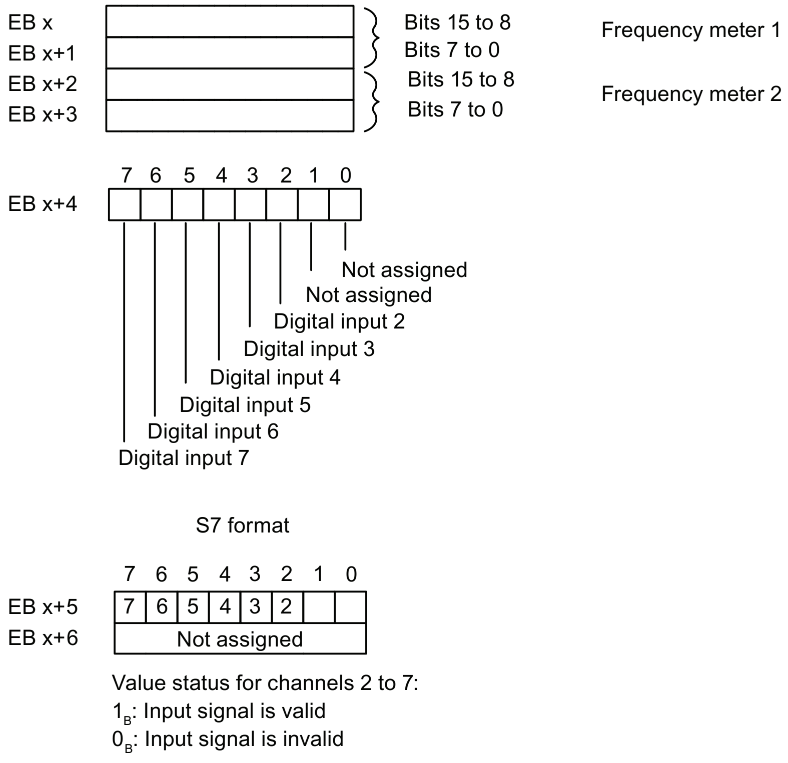
1. Using the mouse, pull module 8 DI Namur from the hardware catalog into distributed I/O station ET 200iSP.
2. Select the required configuration (channel 0..1: "Trace", channel 2..7: "DI"). In the module properties (inspector window), you can find this setting under "Parameters > Inputs > Configuration".

Configuration 0..1: "Trace", channel 2..7: "DI"

Assignment of the digital inputs on electronic module 8 DI NAMUR

Digital input	Terminal	Assignment
Channel 0	1, 2	Frequency counter 1
Channel 1	5, 6	Frequency counter 2
Channel 2	9, 10	Digital input 2
Channel 3	13, 14	Digital input 3
Channel 4	3, 4	Digital input 4
Channel 5	7, 8	Digital input 5
Channel 6	11, 12	Digital input 6
Channel 7	15, 16	Digital input 7

Assignment of process image input (PII) for configuration of channel 0..1: "Trace", channel 2..7: "DI"



Assignment of the process image output (PIQ): The PIQ is not assigned.

Frequency measurement properties (Page 602)

ET 200eco PN

ET 200eco PN Distributed I/O Device

Definition

The ET 200eco PN distributed I/O device is a compact PROFINET IO device in degree of protection IP 65/66 or IP 67 and UL Enclosure Type 4x, Indoor use only.

Field of application

The fields of application of the ET 200eco PN are derived from its special properties.

- A robust design and degree of protection IP 65/66 or IP 67 make the ET 200eco PN distributed I/O device suitable in particular for use in rugged industrial environments.
- The compact design of the ET 200eco PN is particularly favorable for applications in confined areas.
- The easy handling of ET 200eco PN facilitates efficient commissioning and maintenance.

Properties

The ET 200eco PN has the following properties:

- Integrated switch with 2 ports
- Supported Ethernet services:
  - ping
  - arp
  - Network diagnostics (SNMP)
  - LLDP
- Interrupts
  - Diagnostics interrupts
  - Maintenance interrupts
- Port diagnostics
- Isochronous real-time communication
- Prioritized startup
- Device replacement without programming device
- Media redundancy
- Connection to intelligent sensors/actuators via IO link master interface module.

IO Controller

The ET 200eco PN can communicate with all IO Controllers that conform to IEC 61158.

ET 200eco PN can be configured on a CPU with advanced diagnostics.

Documentation on ET 200eco PN
(http://support.automation.siemens.com/WW/view/en/29999018)

Parameter description analog input

Group diagnostics

You can generally enable and disable the diagnostics function of the device with this parameter.

The "Fault" and "Parameter assignment error" diagnostics functions are always independent of the group diagnostics.

Diagnostics, missing 1L+

If you enable this parameter, the check for missing supply voltage is enabled.

Diagnostics, sensor supply short circuit

If you enable this parameter, a diagnostics event is generated if a short-circuit of the sensor supply to ground is detected and the channel is enabled. The sensor supply is monitored for connectors X1, X3, X5 and X7. It is not possible to differentiate which connector has experienced the sensor short circuit.

Interference frequency suppression

With this parameter, you set the integration time of the device, based on the selected interference frequency. Select the frequency of the supply voltage used. Interference frequency suppression Off means 500 Hz, which corresponds to an integration time of 2 ms for a measurement channel.

Temperature unit

Specify the unit of the temperature measurement here.

Measurement type (channel-wise)

With this parameter, you set the measurement type, for example, voltage. For any unused channels, you must select the disabled setting. For a disabled channel, the conversion time and integration time of the channel = 0 s and the cycle time is optimized.

Measuring range

With this parameter, you set the measuring range of the selected measurement type.

Temperature coefficient (for RTD, thermoresistor)

The correction factor for the temperature coefficients (α-value) indicates by what extent the resistance of specific material changes relatively if the temperature increases by 1 °C.

The α-values conform to EN 60751, GOST 6651, JIS C 1604 and ASTM E-1137.

The temperature coefficient depends on the chemical composition of the material.

Smoothing

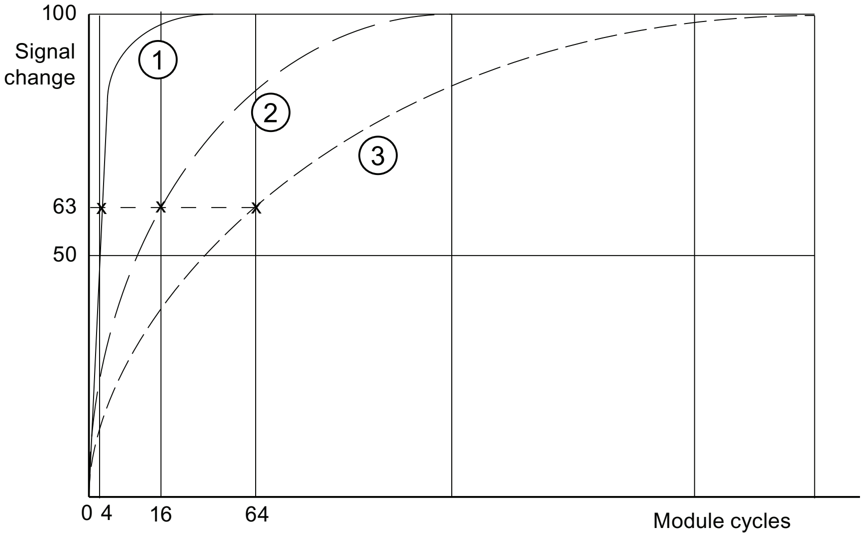
Smoothing of the analog values produces a stable analog signal for further processing. The smoothing of analog values is useful when handling wanted signals (measured values) with a slow rate of change, for example, temperature measurements.

The measured values are smoothed by digital filtering. To achieve smoothing, the device generates a mean value from a specified number of converted (digitized) analog values.

You assign a maximum of four levels for the smoothing (none, weak, medium, strong). The level determines the number of module cycles, from which the mean value is generated.

The stronger the smoothing, the more stable the smoothed analog value and the longer it takes until the smoothed analog value is applied following a signal change (see the example below).

The figure below shows the number of cycles a module requires to apply the smoothed analog value at almost 100% after a step response, based on the smoothing function settings. The figure applies to all signal changes at the analog input. The smoothing value defines the number of cycles a module requires to reach 63% of the end value of the changed signal.



① Smoothing, weak

② Smoothing, medium

③ Smoothing, strong

Diagnostics, wire break

When this parameter is enabled, the Wire break diagnostics event is generated when a wire break is detected.

Observe the rules outlined below to handle a wire break in the 1 to 5 V and 4 to 20 mA measuring ranges:

Parameter	Event	Measured value	Explanation
Enable wire break[1]	Wire break	$7FFF_H$	Diagnostics, **wire break**
Wire break disabled[1] Underflow enabled	Wire break	8000_H	Measured value after leaving the underrange Diagnostic message **Lower limit value undershot**
Wire break disabled[1] Underflow disabled	Wire break	8000_H	Measured value after leaving the underrange

[1] Measuring range limits for wire break detection and measuring range undershoot detection:

- 1 to 5 V: At 0.296 V
- 4 to 20 mA: At 1.185 mA

Diagnostics, underflow

If you enable this parameter, the Underflow diagnostics event is generated when the measured value reaches the underflow range.

Diagnostics, overflow

If you enable this parameter, the Overflow diagnostics event is generated when the measured value reaches the overflow range.

Reference junction for thermoresistor (TC)

A difference in temperature between the measuring point and the free ends of the thermocouple (terminal point) generates a voltage between the free ends, namely the thermoelectric voltage. The value of this thermoelectric voltage is determined by the temperature difference between the measuring point and the free ends and by the type of material combination of the thermocouple. Since a thermocouple always measures a temperature difference, the free ends at the reference junction must be maintained at a known temperature in order to determine the temperature of the measuring point.

If you specify Internal compensation, the temperature of the measuring point in the housing of the I/O device is measured. With the External compensation setting, you can connect a compensation box in series in order to increase the accuracy of the temperature measurement.

Parameter description analog output

Group diagnostics

You can generally enable and disable the diagnostics function of the device with this parameter.

The "Fault" and "Parameter assignment error" diagnostics functions are always independent of the group diagnostics.

Diagnostics, missing 1L+

If you enable this parameter, the check for missing supply voltage is enabled.

Diagnostics, sensor supply short circuit

When this parameter is enabled, the system generates a diagnostics event if it detects a short-circuit of the sensor supply to ground. This diagnostics function is activated when the group diagnostics function is enabled.

Response to CPU/Master STOP

Select how the module's outputs will respond to a CPU STOP:

- Shut down

  The I/O device goes to the safe state. The process image output is deleted (=0).

- Keep last value

  The I/O device retains the last value to be output before STOP.

- Substitute value

  The I/O device outputs the value for the channel set beforehand.

NOTICE
Make sure that the plant is always in a safe state if "Keep last value" is selected.

Type of output

With this parameter, you set the output type, for example, voltage. For any unused channels, select the disabled setting. For a disabled channel, the conversion time and integration time of the channel = 0 s, and the cycle time is optimized.

Output range

With this parameter, you set the output range of the selected output type.

Diagnostics, wire break (in current mode)

When this parameter is enabled, the **Wire break** diagnostics event is generated when a wire break is detected. This diagnostics event cannot be detected in the zero range.

Diagnostics, short circuit (in voltage mode)

If you enable this parameter, a diagnostics event is generated in the event of a short circuit in the output line. This diagnostics event cannot be detected in the zero range.

Diagnostics, overload

If you enable this parameter, the diagnostics event is generated in the event of an overload.

Substitute values

With this parameter, you enter a substitute value that the module is to output in CPU-STOP mode. The substitute value must be in the nominal range, overrange, or underrange.

Signal modules for process automation

Fundamentals

Introduction

Signal modules for the process automation are S7-300 models, such as SM 321; DI 16xNAMUR or SM 322; DO 16x24VDC/0.5A.

They are being operated in a DP slave (IM 153-2).

Unlike standard modules, they offer the following additional technical functions, such as pulse extension and chatter monitoring.

See also

Changeover contact (Page 611)

Technological parameters (Page 612)

Changeover contact

"Changeover contact" sensor type

If the digital inputs of a channel group are configured as "changeover contacts", the module runs diagnostics for the changeover contact sensor type for this channel group.

Changeover contact

A changeover contact is an auxiliary switch with only one moving switch element with one close setting each for closed and open switching device.

Remember the following rule:

- Always connect a normally open contact to the "even" channel
- Always connect a normally closed contact to the "odd" channel.

The tolerated switchover time between the two channels is fixed at 300 ms.

If the result of the check is negative, then

- the module identifies the value status of the normally open channel as "invalid"
- the module generates a diagnostic entry for the normally open channel
- triggers a diagnostic interrupt (if diagnostic interrupts have been enabled)

The digital input signal and the value status are updated only for the normally open channel. For the normally closed channel, the digital input signal is set permanently to "zero" and the value status to "invalid" since this channel is used only to check the sensor.

Diagnostics depends on the "Selection" parameter (of the sensor). You should also note the special features of diagnostics with the changeover contact sensor type in the "Signal Modules for Process Automation" manual.

Documentation on modules for process automation (http://support.automation.siemens.com/WW/view/de/7215812/0/en)

Technological parameters

Pulse extension and flutter monitoring

Pulse extension is a function for changing a digital input signal. A pulse at a digital input is extended to at least the length set in the parameters. If the input pulse is already longer than the specified length, it is not changed.

If you want the pulse to be extended, click in the box to select the time. If you do not want the pulses to be extended, select the "---" entry.

Flutter monitoring is a process control function for digital input signals. It detects and reports signal changes that are unexpected in process control, for example when an input signal fluctuates too often between "0" and "1".

Flutter monitoring is possible only when group diagnostics has also been enabled for this input.

Monitoring window and number of signal changes

Flutter monitoring works with aid of the two parameters Monitoring window and Number of signal changes.

The first time the signal changes, the time set as the monitoring window is started. If the signal changes more often during this time than allowed by the number of signal changes parameter, this is signaled as a flutter error. If no flutter error is detected during the monitoring window time, the monitoring window can be restarted at the next signal change.

Note

If you set pulse extension for an input channel, this also affects the flutter monitoring enabled for this channel. The "extended pulse" signal is the input signal for the flutter monitoring. You should therefore make sure that the values set for pulse extension and flutter monitoring are compatible with each other.

Frequency converters

Use of the frequency converter

Frequency converters

The frequency converter ICU24 and ICU24F (as fail-safe version) are modular design frequency converters that are completely embedded in the distributed I/O system ET 200S. For parameterization of both modules, please see the following.

Message frame

The message frame number and the operating mode of the module are only displayed and cannot be modified.

Application ID

You indicate the saved parameters in the frequency converter as a whole with the application ID. Enter an application ID from the value range 0 to 65535. During startup (or pull/plug), this ID is compared with the application ID stored on the converter.

Converters that work with identical applications are usually also identically parameterized and should be identified with the same application ID. Converters with the same application ID may be exchanged between each other. Copying of the complete parameterization of a converter to another converter, for example, via an MMC, is only accepted, if both have the same application ID.

Converters that work with different applications and are parameterized differently must be identified by different application IDs. This prevents a converter with unsuitable parameterization from starting on an incorrect slot, i.e. on the wrong application. This also prevents the parameterization that is saved in the converter from being accidently overwritten with any parameteriation that is stored on an MMC.

Enable diagnostic interrupt

You can enable the diagnostic interrupt for the frequency converter. If diagnostic interrupt is enabled, an OB 82 must be available in a CPU to process the diagnostic events.

IQ sense module

Properties of 4 IQ-SENSE

Properties

The 8 IQ-SENSE module has the following properties:

- Connection of sensors with IQ-SENSE®, photoelectric proximity switches: for example, reflex sensors, diffuse sensors, and laser sensors.
- It can be used centrally in an S7-300 or distributed in an ET 200M.
- You can connect up to 8 sensors to every module. Each sensor requires a two-wire cable.
- Function reserve that can be assigned parameters.
- Time functions, switching hysteresis, synchronous mode that can be assigned parameters
- Sensitivity and distance values can be specified (*IntelliTeach* using the "IQ-SENSE Opto" FB)
- Teach-in
- Sensors can be removed and inserted during operation (automatic reassignment of parameters)

See also

Sensor type (Page 615)

Switching hysteresis (Page 616)

Time function,time value (Page 617)

Sensor type

This parameter is used to set the sensor type per channel:

- Reflex sensor or
- Diffuse sensor or
- De-activated

Diffuse sensor

Table 8- 7 Diffuse sensor

Diffuse sensor	Object	
Transmitter Receiver		Circuit state 0: no object detected, i.e. the object is not in the beam. The receiver does not see any light.
Transmitter Receiver		Circuit state 1: object detected, i.e. the object is in the beam. The receiver does not see any light.

Reflex sensor

Table 8- 8 Reflex sensor

Reflex sensor	Object	
Transmitter Receiver		Circuit state 0: no object detected, i.e. the object is not in the beam. The receiver sees light.
Transmitter Receiver		Circuit state 1: object detected, i.e. the object is in the beam. The receiver does not see any light.

Switching hysteresis

Faults with the diffuse sensor or in the production process can result in signal wobbles. The measured value then changes the switching threshold by 100 % (object detected - object not detected). You can prevent this switching threshold wobble using the switching hysteresis parameter. This will ensure a stable output signal on the sensor.

You can assigned parameters to 5 %/10 %/20 %/50 % for switching hysteresis.

Prerequisites

You can only set the switching hysteresis parameter for diffuse sensors with background fadeout.

Operating principle

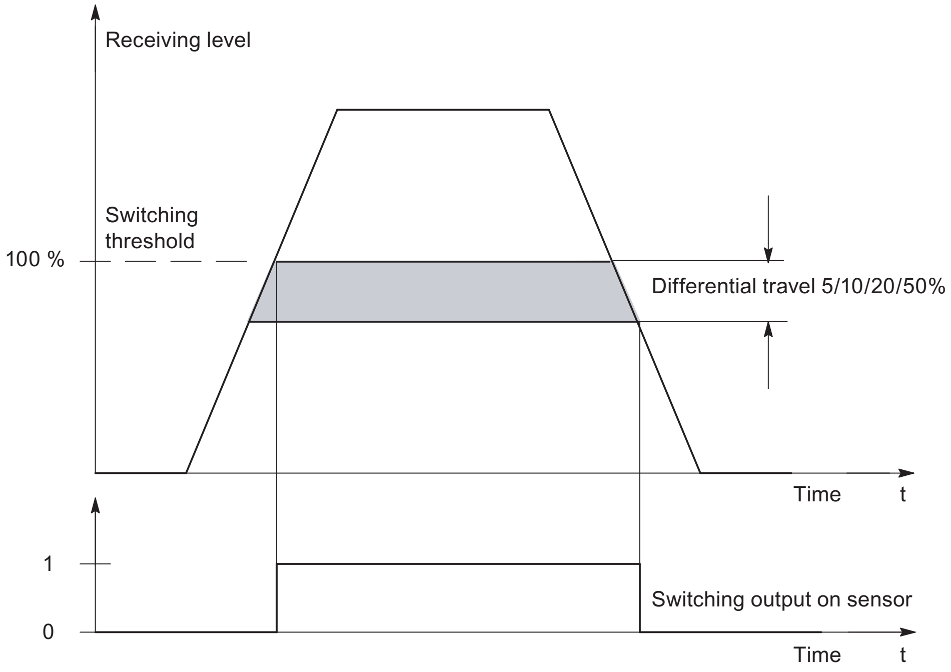

Figure 8-3 Switching hysteresis parameter

Time function,time value

These parameters can be used to set the electronic module for its specific application.

Operating principle

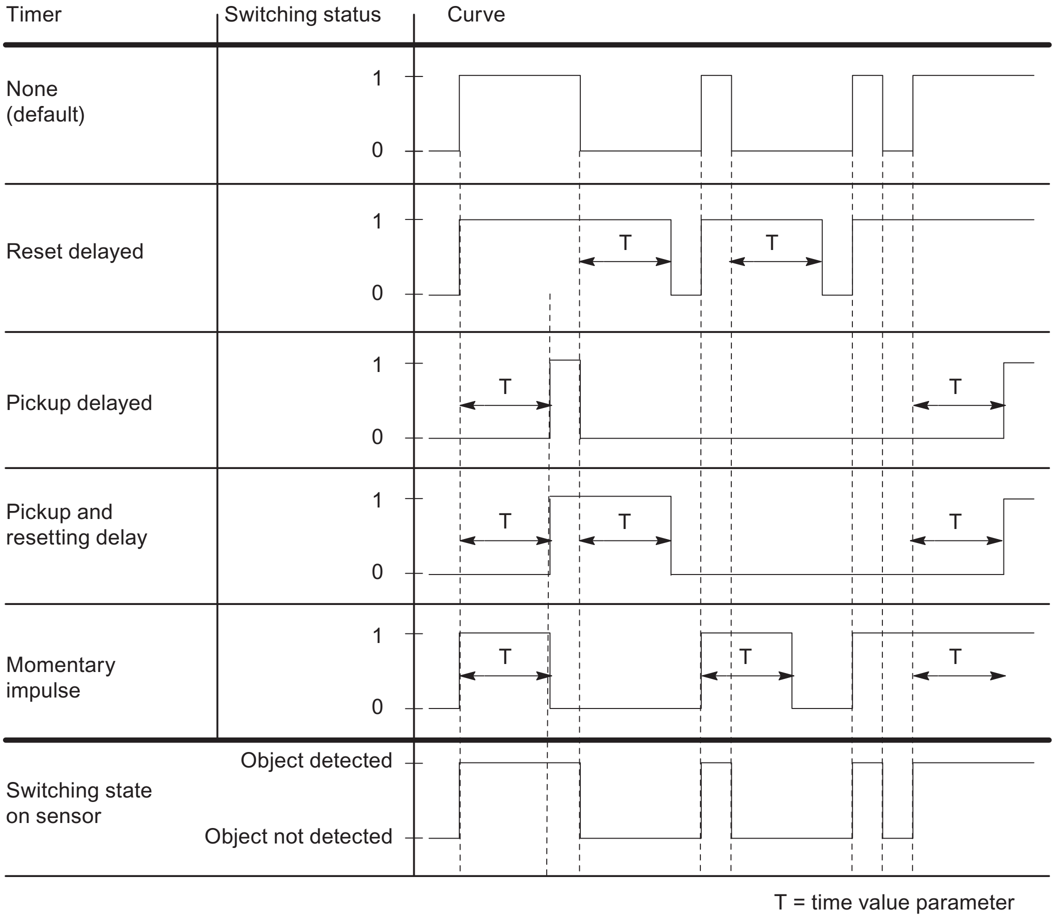

Figure 8-4 Time functions, time values parameters

8.1.5.3 Parameters of analog modules

Measurement types with thermocouples

Differences in the measurement types with thermocouples

- Thermocouples with reference junction

  TC-IL (internal reference junction, with linearization): Linearization of the characteristic and temperature compensation with the temperature of the internal reference junction (module clamping point) as the reference temperature.

  TC-EL (external reference junction, with linearization): Linearization of the characteristic and temperature compensation with the temperature of the external reference junction as the reference temperature.

- Thermocouples with reference temperature

  TC-L00C (0 ºC reference junction, with linearization): Linearization of the characteristic and temperature compensation with 0 °C / 32 °F

  TC-L50C (50 ºC reference junction, with linearization): Linearization of the characteristic and temperature compensation with 50 °C / 122 °F

Interference frequency suppression and integration time

Interference frequency suppression and integration time

The following table illustrates the interaction:

Interference frequency suppression (Hz)	Integration time (ms)
60	16,6
50	20

With some modules, you can set other frequencies for the interference frequency suppression:

Interference frequency suppression (Hz)	Integration time (ms)
10	100
400	2,5

8.1.6 System diagnostics with 'Report System Errors'

8.1.6.1 Introduction to system diagnostics with 'Report System Errors'

Introduction

When a system error occurs, hardware components and devices of other manufacturers (slaves whose properties are set by the GSD files) can trigger organization block calls.

Example: If a wire breaks, a module with diagnostics capability can call OB 82.

The hardware components provide information on the system error that has occurred. The start event information, in other words, the local data of the assigned OB (including data record 0), provides general information on the location (for example, logical address of the module) and type (for example channel error or module fault) of the error.

The problem can also be specified in greater detail using additional diagnostics information (reading data record 1 with the "RDSYSST" instruction or reading the diagnostics frame from standard DP slaves with the "DPNRM_DG" instruction): For example, channel 0 or 1, broken wire or measuring range exceeded.

System diagnostics with "Report System Errors" (RSE) provides you with a convenient way of evaluating this diagnostics information for S7-300/400 PLCs, ET200S, ET200Pro and software PLCs and to display it in the form of messages. The required blocks and alarm texts are created in the properties of the particular PLC. You only need to download the generated blocks to the CPU and, if required, transfer the texts to connected HMI devices.

To display diagnostics events graphically, for example on an HMI device or via a Web server, you can generate one or more status DBs. These status DBs are updated by the system diagnostics blocks and then contain information on the current state of the system.

8.1.6.2 Basics of system diagnostics

Using system diagnostics with "Report System Errors", you can generate blocks that analyze errors in the system and generate alarms with a textual error description and the error location.

These alarms are defined per component with alarm capabilities (for example channel errors or rack errors) and are limited to 255 alarms component with alarm capability. You will receive a message if this limit is exceeded.

General settings that you make or change in system diagnostics are stored along with the project. The influence on the system diagnostics only takes effect after generating the blocks, compiling the hardware configuration and downloading the configuration to the components involved.

Recommended procedure

Make the settings for reporting system errors and the structure of the alarms. Specify which diagnostics blocks will be created. Configure the OBs, Status DBs, as well as the PLC in STOP. Generate the blocks and download the configuration to apply the changes.

You will find detailed information in the sections below.

Note

If you use system diagnostics, the system response of the plant may change if an error occurs. For example, the CPU may not change to "STOP" mode as it would without system diagnostics.

Make sure that all protective mechanisms of the plant are working properly.

8.1.6.3 Components supported

The following components are supported:

- S7-300 CPUs
- S7-400 CPUs
- S7-400 power supply modules
- PN/PN Coupler
- DP/DP Coupler
- IE/PB-Link
- AS-i CP
- ET 200S
- ET 200M
- ET 200eco
- ET 200R
- ET 200Pro
- ET 200L
- Diagnostics repeater
- GSD-based slaves
- GSDML-based slaves
- ET 200iSP
- IO-Link
- Software CPUs

8.1.6.4 Diagnostics blocks for reporting system errors

Once you have made the settings for reporting system errors, the required blocks (FB with assigned instance DB and one or more global DBs, an FC and, depending on the setting, also OBs that do not yet exist) and status DBs are created the next time you compile the hardware configuration.

The following blocks are created:

- Diagnostics FB (default: FB 49),
- Instance DB for the diagnostics FB (default: FB 49),
- Global DB (default: FB 50),
- Diagnostics FC (default: FC 49),
- Error OBs (if you have selected this option in the "OB configuration" group box),
- Cyclic OBs (if you have selected this option in the "OB configuration" group box),
- Optional status DBs

The created blocks (except OBs) are stored in the project tree under "Program blocks > System blocks > Report System Errors".

See also

Properties of the blocks (Page 622)

8.1.6.5 Properties of the blocks

Diagnostics blocks

The created diagnostics blocks (FB with assigned instance DB and one or more global DBs and an FC) evaluate the local data of the error OB and read any additional diagnostics information from the hardware component that triggered the error.

They have the following properties:

- Created in RSE language (report system errors) (also applies to the blocks listed above)
- Know-how protected (also applies to the blocks listed above)
- Delay incoming interrupts during runtime

Status DBs

The Status DBs are used as the interface for diagnostic blocks and make it possible to

See also

Settings for system diagnostics blocks (Page 635)

8.1.6.6 Supported error OBs

The following error OBs are created if they are also supported by the configured CPU:

OB	Diagnostics FB call	Description
OB 70 (IO redundancy error)	possible	This OB exists only with H-CPUs.
OB 72 (CPU redundancy error)	possible	This OB exists only with H-CPUs.
OB 73 (communications redundancy error)	possible	This OB exists only with a few H-CPUs.
OB 81 (power supply error)	possible	
OB 82 (diagnostics interrupt OB)	possible	
OB 83 (pull/plug interrupt)	possible	
OB 85 (program execution error)	not possible	If 'RSE' creates this OB when it is generating the diagnostics blocks, additional networks are inserted to implement the following program sequence: • If errors occur when updating the process image (for example removing the module), the CPU is prevented from changing to STOP so that the diagnostic FB can be run in OB 83. If there is a setting for "CPU STOP" after an alarm from "RSE", this takes effect in OB 83. • With all other error events of OB 85, the CPU changes to STOP.
OB 86 (failure of an expansion rack, a DP master system or a distributed I/O device)	possible	

If the OBs already exist...

Existing error OBs on not overwritten. If appropriate, the call for the diagnostics FB is appended in the existing OB.

If the configuration includes distributed I/O devices...

To evaluate errors in the distributed I/O, the created FB automatically calls the "DPNRM_DG" instruction (read diagnostics data of the DP slaves). For this function to operate correctly, the created FB must be called either only in OB 1 or in a cyclic interrupt OB with a short call interval and in the startup OBs.

NOTICE

Please note the following:

- Due to the OB 85 created by "RSE", the CPU does not change to STOP if the "error updating the process image" error event occurs.
- OB 85 is also called by the CPU in the following error situations.
  - "Error event for an OB that is not loaded"
  - "Error calling or accessing a block that is not loaded"

    In these error situations, the OB 85 generated by "RSE" still changes the CPU to STOP in the same way as prior to the use of "RSE".
- The setting "PLC in STOP" does not have any effect in OB 85, because this OB of the "RSE" FB is not called. This setting is taken into account indirectly by the FB call in OB 83.

See also

Settings for OB configuration (Page 637)

8.1.6.7 Overview of the status DBs

Within system diagnostics, you have the option of creating status DBs. These status DBs are updated by the system diagnostics blocks and then contain information on the current state of the system. The following status DBs are available:

- The diagnostics status DB (default: DB 127) displays the state of racks, and central modules, PROFIBUS slaves and IO devices.
- The PROFINET IO DB (default: DB 126) displays the state of IO devices in I/O systems and the state of DP slaves in DP master systems downstream from an IE/PB-Link.
- The PROFIBUS DP DB (default: DB 125) displays the status of PROFIBUS slaves in DP master systems.

8.1.6.8 Diagnostics status DB

Interface for the diagnostics status DB

The created data block (default: DB 127) allows you to query the system state of a configured component and, if required, all its lower-level components.

This data block is required to support system diagnostics using the Web server or diagnostics viewer. As default, it is enabled.

NOTICE
Please note that system diagnostics must be activated both on the Web server or diagnostics viewer and in the Inspector window of the PLC to be able to display diagnostics data of the status DBs.

After restarting a CPU with Web server, the module state is displayed following a delay. To shorten the waiting time, you can call the RSE diagnostics block in a cyclic interrupt OB.

Structure of the diagnostics status DB

Address	Name	Data type	Description
+0	Directory		
0	D_Version	WORD	Version supported by system diagnostics
2	D_pGlobalState	WORD	Byte offset to the start of the "GlobalState" section
4	D_pQuery	WORD	Byte offset to the start of the "Query" section
6	D_pComponent	WORD	Byte offset to the start of the "Component" section
8	D_pError	WORD	Byte offset to the start of the "Error" section
10	D_pState	WORD	Byte offset to the start of the "State" section
12	D_pAlarm	WORD	Byte offset to the start of the "Alarm" section
14	D_pSubComponent	WORD	Byte offset to the start of the "Subcomponent" section
+16	GlobalState		
0	G_EventCount	WORD	ID of the last event (counter)
2.0	G_StartReporting	BOOL	Startup evaluation active
+20	Query		
0	Q_ClientID_User	DWORD	ID of the client; here, please use a value between 1 and 255. Make sure that different clients use different IDs.
4	Q_ClientID_Intern	DWORD	ID of the client (internal)
8.0	Q_WithSubComponent	BOOL	With/without status of the lower-level components (slower)
8.1	Q_SubComponentAlarm	BOOL	AS-i master returns AS-i slave interrupts
8.2	Q_Reserved2	BOOL	Reserved

Address	Name	Data type	Description
8.3	Q_Reserved3	BOOL	Reserved
8.4	Q_Reserved4	BOOL	Reserved
8.5	Q_Reserved5	BOOL	Reserved
8.6	Q_Reserved6	BOOL	Reserved
8.7	Q_Reserved7	BOOL	Reserved
9.0	Q_Start	BOOL	Start query
10	Q_Error	BYTE	Internal error in query
11	Q_Reserved8	BYTE	Reserved
+32	Component		
0	C_AddressMode	BYTE	Addressing mode of the module
1	C_Reserved1	BYTE	Reserved
2	C_ComponentID	WORD	Hardware ID of the component (internal)
+36	Error		
0	E_ErrorNo	WORD	Index of the requested/actual error
2.0	E_LastError	BOOL	Is set when E_ErrorNo does not equal 0. Value TRUE if E_ErrorNo is the index of the last error otherwise FALSE
2.1	E_Reserved	ARRAY [1 to 15] BOOL	Reserved
+40	State		
0	S_Hierarchy	BYTE	Reserved
1	S_Periphery	BYTE	Reserved
2.0	S_SupFault	BOOL	The component cannot be reached
2.1	S_NotAvailable	BOOL	The component does not exist
2.2	S_Faulty	BOOL	The component is faulty, the "Alarm" section is not empty
2.3	S_MoreErrors	BOOL	There are more errors than system diagnostics can store
2.4	S_Maintenance1	BOOL	A maintenance request is pending
2.5	S_Maintenance2	BOOL	A maintenance demand is pending
2.6	S_Deactivated	BOOL	The component was deactivated *)
2.7	S_Reserved2	BOOL	Reserved
3.0	S_SubFault	BOOL	A subcomponent is faulty
3.1	S_SubMaintenance1	BOOL	A maintenance request is pending for a subcomponent
3.2	S_SubMaintenance2	BOOL	A maintenance demand is pending for a subcomponent
3.3	S_SubDeactivated	BOOL	A subcomponent is deactivated
3.4	S_Reserved4	BOOL	Reserved
3.5	S_Reserved5	BOOL	Reserved
3.6	S_Reserved6	BOOL	Reserved

Address	Name	Data type	Description
3.7	S_Reserved7	BOOL	Reserved
4	S_TIAMS	DWORD	Maintenance state of the component
8	S_TIAMSChannelExist	DWORD	Maintenance state: Configured channels
12	S_TIAMSChannelOK	DWORD	Maintenance state: Faulty channels
16	S_ChannelCount	WORD	Number of channels; valid only when Q_WithSubComponent is set
18.0	S_ChannelVector	ARRAY [0 to 255] BOOL	Number of channels affected; valid only when Q_WithSubComponent is set
+90	Alarm		
0	A_ComponentID	WORD	Hardware ID of the component (internal)
2	A_TextID1	WORD	ID of the first error text
4	A_TextLexikonID1	WORD	ID of the first error text lexicon
6	A_HelpTextLexikonID1	WORD	ID of the first help text lexicon
8	A_MapTextID	WORD	ID of the first error text (HMI)
10	A_MapHelpTextID	WORD	ID of the first help text (HMI)
12	A_TextID2	WORD	ID of the second error text
14	A_TextLexikonID2	WORD	ID of the second error text lexicon
16	A_HelpTextLexikonID2	WORD	ID of the second help text lexicon
18	A_MapTextID2	WORD	ID of the second error text (HMI)
20	A_MapHelpTextID2	WORD	ID of the second help text (HMI)
22	A_AlarmID	DWORD	Alarm number
26	A_ValueCount	WORD	Number of further bytes occupied (12)
28	A_AssociatedValue	ARRAY [1 to n] WORD	Associated values of the alarm n = A_ValueCount / 2 (= 6)
+130	SubComponent		
0	U_SubComponentCount	WORD	Number of subcomponents
2	U_SubComponentFault	ARRAY [1 to n] BYTE	List of subcomponents "n" depends on the configuration **)

*) If the component was deactivated, the index of the requested/actual error is not changed and "E_LastError" is set to "true". The tag area of the alarm is also not filled in.

**) The list of subcomponents is valid only when Q_WithSubComponent is set. The ARRAY has a status byte for each configured component. For a master, the ARRAY contains the status of the configured stations sorted in ascending order according to the station ID. For a station, the ARRAY contains the status of the configured slots sorted in ascending order according to slot number. This field can contain a maximum of 4096 entries (for an IO system): only the actual maximum size is displayed.
The status byte for each lower-level component is defined as follows:
Bit 0 = SubFault: the component cannot be reached
Bit 1 = Fault: the component is not available or faulty
Bit 2 = Maintenance1: the component has reported a need for maintenance
Bit 3 = Maintenance2: the component has reported a need for maintenance
Bit 4 = Deactivated: the component was deactivated
Bit 5 = SubFault: a subcomponent is faulty
Bit 6 = SubMaintenance1: the component has reported a need for maintenance
Bit 7 = SubMaintenance2: a subcomponent has reported a need for maintenance

8.1.6.9 PROFINET IO DB

Interface for the PROFINET IO DB

The generated data block represents the current status of all configured IO devices and can describe the status of a device in greater detail in response to a query from an HMI device. The data block is generated dynamically and depends on the hardware configuration. The DB uses the diagnostics FB generated by system diagnostics to access the diagnostics data. The current status of the devices is entered in the DB directly by this FB.

Only one HMI device (for example OP, MP, PC) can access the DB. If several HMI devices are connected, simultaneous access is interlocked using the HMI_ID tag.

Note

The diagnostics downstream from an IE/PB-Link is restricted.

Structure of the PROFINET IO DB

Address	Name	Data type	Description
0	HMI_ID	WORD	No. of the OP that uses the DB (0 = unused)
2	System_No	WORD	No. of the IO system to be investigated
4	Device_No	WORD	No. of the IO device to be investigated
6.0	Enable	BOOL	Calls up the errors of the specified device
6.1	Next_Error	BOOL	Calls up the next error of the specified device
6.2	Busy	BOOL	Busy = 1; evaluation active
6.3	More_Errors	BOOL	There are more error messages
7	Device_Status	BYTE	Status of the affected device

Address	Name	Data type	Description
8	Offset_System_Header	WORD	Address of Detail_IO_Sys[n] in the system being evaluated
10	Offset_System_Array	WORD	Address of IO_Sys[n] in the system being evaluated
12	Vendor_ID	WORD	Vendor ID is filled out if it is supported by the CPU
14	Device_ID	WORD	Device ID is filled out if it is supported by the CPU
16	Error_Level	BYTE	Error level 1=IO device, 2=module, 3=submodule, 4=channel
17		BYTE	Reserved
18	Module_No	WORD	No. of the module affected
20	Submodule_No	WORD	No. of the submodule affected
22	Channel_No	WORD	No. of the channel affected
24	Error_Cat	DWORD	Category of the error (lexicon ID)
28	Help_Cat	DWORD	Category of the error in the help lexicon
32	Error_No	DWORD	Number of the error (index in help lexicon)
36	Map_ErrorNo	WORD	The number of the error text
38	Map_HelpNo	WORD	The number of the help text
40	Number_IO_Sys	WORD	Number of configured IO systems
42	Systems_Status	WORD	Overview of all IO systems

Dynamic tag area

	Name	Type	Comment
Once	Detail_IO_Sys	Struct[n]	Array of structures per IO system
Per IO system	System_No	Word	System number
	Max_Num_Dev	Word	Maximum ID of the configured devices
	Offset	Word	Offset to the start of the field in bytes relative to Detail_IO_Sys
	Devices_Affected	Word	Number of devices affected
	Offset_Status	Word	Offset to the start of the IO_Sys_Status field in bytes regardless of Detail_IO_Sys
Per device	IO_Sys_<n>	ARRAY OF WORD[n]	Status of the groups, 1 bit for 16 devices. The table is large enough to include all configured devices (Max_Num_Dev).

Status of a device in the overview IO_Sys_<n>

Status	OK	faulty	failed	not configured
Coding (bit b+1, bit b)	00	01	10	11

Byte	N				N+1			
Bit	6-7	4-5	2-3	0-1	6-7	4-5	2-3	0-1
IO_Sys_<n>[0]: Device number	4	3	2	1	8	7	6	5
IO_Sys_<n>[1]: Device number	12	11	10	9	16	15	14	13
...								

Status of a device group in the overview IO_Sys_Status_<n>

Status	All devices of the group are OK or not configured	At least one device of the group is faulty or failed
Coding	0	1

...						

8.1.6.10 PROFIBUS DP DB

Interface for the PROFIBUS DP DB

The generated data block represents the current status of all configured stations of the current DP master system and can describe the status of all DP slaves in greater detail in response to a query. The data block is generated dynamically and depends on the hardware configuration. The DB uses the diagnostics FB generated by system diagnostics to access the diagnostics data. The current status of the DP slaves is entered in the PROFIBUS DB directly by this FB.

During the processing of the PROFIBUS DB, all interrupts are delayed.

Note

Diagnostics is not possible with the master system of an IE/PB-Link. Diagnostics is performed using the PROFINET IO DB.

"Manual" mode

In this mode, all errors of the selected station are displayed one after the other.

"Automatic" mode

In this mode, the errors of all configured stations are displayed one after the other.

Structure of the PROFIBUS DP DB

Address	Name	Data type	Description
0	DP_MASTERSYSTEM	INT	Number of the DP master system
2.0	EXTERNAL_DP_INTERFACE	BOOL	External DP interface (CP/IM)
2.1	MANUAL_MODE	BOOL	Mode
2.2	SINGLE_STEP_SLAVE	BOOL	Move on to the next station affected
2.3	SINGLE_STEP_ERROR	BOOL	Move on to the next error
2.4	RESET	BOOL	DP master system (number and interface) are adopted: everything re-initialized
2.5	SINGLE_DIAG	BOOL	DP slave single diagnostics
3	SINGLE_DIAG_ADR	BYTE	DP slave address in single diagnostics
4.0	ALL_DP_SLAVES_OK	BOOL	Group indicator showing whether or not all DP slaves are operating error-free
5	SUM_SLAVES_DIAG	BYTE	Number of stations affected (faulty or failed)
6	SLAVE_ADR	BYTE	Station number of the current station

Address	Name	Data type	Description
7	SLAVE_STATE	BYTE	Status of the station: 0:o.k. 1:failed 2:faulty 3:not configured/diagnostics not possible
8	SLAVE_IDENT_NO	WORD	PROFIBUS identification number
10	ERROR_NO	BYTE	Current error number
11	ERROR_TYPE	BYTE	1:Slot diagnostics (general information) 2:Module status 3:Channel diagnostics to DP standard 4:S7 diagnostics (DS0/DS1) 5:Device diagnostics (vendor-specific) 6:Cable diagnostics (diagnostics repeater) 7: Decoded device diagnostics
12	MODULE_NO	BYTE	Slot number.
13	CHANNEL_NO	BYTE	Channel number.
14	CHANNEL_TYPE	BYTE	Channel type
15	CHANNEL_ERROR_CODE	BYTE	Error code
16	CHANNEL_ERROR_INFO_1	DWORD	Channel error code 1
20	CHANNEL_ERROR_INFO_2	DWORD	Channel error code 2
24	DIAG_COUNTER	BYTE	Sum of all the diagnostics information of the displayed station
25.0	DIAG_OVERFLOW	BOOL	Diagnostics overflow
25.1	BUSY	BOOL	Evaluation active
932 - 1176	DIAG_DAT_NORM	BYTE [1 to 244]	Slave diagnostics data
1176 - 1191	CONFIG_SLAVES	DWORD [1 to 4]	Configured slaves
1192 - 1207	EXIST_SLAVES	DWORD [1 to 4]	Existing (addressable) slaves
1208 - 1223	FAILED_SLAVES	DWORD [1 to 4]	Failed slaves
1224 - 1239	FAULTY_SLAVES	DWORD [1 to 4]	Faulty slaves
1240 - 1255	AFFECT_SLAVES	DWORD [1 to 4]	Slaves affected (faulty or failed)
1256 - 1271	AFFECT_SLAVES_MEM	DWORD [1 to 4]	Stored affected slaves (internal)
1272 - 1397	DIAG_CNT	BYTE [1 to 126]	Number of diagnostics per slave
1404	ERROR_CAT	DWORD	Text lexicon ID of the error text
1408	HELP_CAT	DWORD	Text lexicon ID of the help text
1412	ERROR_NO	DWORD	Text ID in the text lexicon
1416	MAP_ERRORNO	WORD	Error ID
1418	MAP_HELPNO	WORD	Help text ID

Address	Name	Data type	Description
1420	MASTERSTATUS_FAILED	BOOL [1 to 32]	True if at least one station of the PROFIBUS master system (1 to 32) has failed
1424	MASTERSTATUS_FAULTY	BOOL [1 to 32]	True if at least one station of the PROFIBUS master system (1 to 32) is faulty

8.1.6.11 Displaying settings of system diagnostics

Requirement

You are in the "Properties" area of the Inspector window of the required PLC.

Procedure

To display and edit the settings for system diagnostics, follow these steps:

1. Click "System diagnostics" in the area navigation of the Inspector window. In the right-hand part of the Inspector window, you can display and edit the various settings.

8.1.6.12 Basic settings

General settings

Here, you can decide which options will be enabled when the diagnostic block executes.

Enabling system diagnostics for this PLC (RSE)

This option is enabled by default.

NOTICE
If you disable this option, no diagnostics data is read out in the Web server and diagnostics viewer either even if the option is enabled there. If you disable this option on a PLC on which it was previously enabled, all the diagnostic data is deleted the next time you compile the hardware configuration.

Send alarms

This option is enabled by default. The diagnostics block then sends alarms as a reaction to system errors.

Download system diagnostics block when downloading hardware configuration

Enable this option if you want the diagnostics blocks to be generated or updated each time the hardware is compiled. So make sure that the generated alarms are up to date even after modifying the hardware configuration.

Settings for configuring alarms

You can adapt the structure and texts of the alarms created by system diagnostics and the alarm attributes freely for each reporting component.

Alarming component

Select the component (for example module or rack) for which you want to configure the alarm text.

Available alarm information

Select the entries you want to include in the alarm and click of one of the arrow buttons to include the dynamic information in the event text or info text. Regardless of your selection, the start of each alarm indicates whether it is entering or exiting state or is an alarm requiring acknowledgment and when the error/fault occurred.

See also

Adapting event text/info text (Page 634)

Adapting event text/info text

You can adapt texts to match your requirements by positioning the cursor on the required position in the box and modifying the text. Event texts and info texts can have one or more lines. Tags output by the software (for example <rack number>) are displayed in pointed brackets. If you modify these, they are no longer tags.

See also

Settings for configuring alarms (Page 634)

Attributes

The default alarm attributes "Priority", "Group ID" and "Display class" and the options "Logging" and "With acknowledgement" can be set separately for each individual reporting component.

You will find more detailed information on the alarm attributes in the description of "Configuring alarms".

Settings for system diagnostics blocks

As default, the following values are set for the system diagnostics blocks:

Block	Name	Number
Diagnostics FB	RSE_FB	49
Diagnostics DB	RSE_DB	49
first global DB	RSE_GLOBAL_DB	50
Diagnostics FC	RSE_FC	49

You can, however, assign different numbers and/or names for these blocks as long as they are not already being used.

Settings for diagnostics support

With the help of diagnostics support, diagnostics data is made available in special status DBs by the diagnostics FB. This can then be displayed graphically, for example on an HMI device.

Status DBs

Enable the required status DB to read out the current system status of configured components via this data block.

The following status DBs are set as defaults:

Block	Name	Number
Diagnostics status DB	RSE_DIAGNOSTIC_STATUS_DB	127
PROFINET IO DB	RSE_PROFINET_IO_DB	126
PROFIBUS DP DB	RSE_PROFIBUS_DP_DB	125

You can, however, assign different names and/or number for these blocks as long as they are not already being used.

If the "Enable Web server on this module" functionality is enabled in the properties of the CPU, the diagnostics status DB must be enabled. As default, DB 127 is generated if the CPU supports the Web server and if this is enabled in the properties of the CPU.

Note

The status DBs "PROFINET IO DB" and "PROFIBUS DP DB" only have limited diagnostics functionality. It is therefore preferable to use the "diagnostics status DB".

Extended diagnostics settings

This query is only possible if the PLC includes the "D_ACT_DP" instruction.

Enable the option "Query for status "activated/deactivated" after PLC startup" if you want the status of slaves to be queried.

Enable the "Send alarm if status changes from/to activated or deactivated" if you want an alarm to be output when there is a status change. To use this option, execute the "D_ACT_DP" instruction in mode 3/4 and select the diagnostics DB call in OB 86 in the "OB configuration" group.

8.1.6.13 Advanced settings

Settings for OB configuration

Here, you can make the settings you require for OBs.

- Error OBs
- Cyclic and startup OBs

The OBs that are supported by system diagnostics and the CPU are displayed in the "OB" column.

The "Exists" column indicates whether the OB already exists. This column cannot be edited.

In the "Create OB" column, you can choose whether or not the OB should be generated if it does not already exist.

In the "Call system diagnostics block" column, you can set the system diagnostics FB call if the OB already exists or will be generated. You can also remove an existing call again. If OBs exist that were not written in LAD/FBD or STL, it is not possible to insert or delete the call.

Note

- Error OBs: Before the function will execute correctly, system diagnostics must be called in all supported error OBs. There is an automatic check to determine whether or not these requirements are met.
- Cyclic and startup OBs: Before the function will execute correctly, system diagnostics must either be called in OB 1 or in a cyclic interrupt OB (30 - 38) and in all startup OBs. There is an automatic check to determine whether or not these requirements are met.

See also

Supported error OBs (Page 623)

Settings for "PLC in STOP"

Here, you can decide whether or not the PLC changes to STOP mode if a system error within an error class occurs.

The following table shows the available error classes and their meaning:

Error class	Meaning
Rack error	Errors triggered by OB 86.
Component error	• Errors in data record 0 triggered by OB 82 (global module errors) • Remove/insert module error triggered by OB 82 (DPV0) or OB 83 (central module, DPV1 and PROFINET)
Channel error	Channel errors triggered by OB 82 (data record 1, standard DP slave channel error, PROFINET channel error)
Subcomponent error	Error on a subcomponent with a subslot >= 1.

Note

In "Startup" mode, the PLC does not change to STOP regardless of the settings you made.

See also

Assignment of error classes to system errors (Page 639)

Assignment of error classes to system errors

The following table shows which system error is assigned to which error class:

Hardware	Error	Error class
Central		
Rack	Failure	Rack error
Power supply module/CPU	Power supply error	- *
H-CPU	Loss of redundancy	- *
	Return of redundancy	- *
Module	Removal/insertion of module or wrong module type	Component error
	Data record 0	Component error
	Channel error	Channel error
DP master	Failure	Rack error
IO controller	Failure	Rack error
AS-i master	Failure	Rack error
PROFIBUS DP		
DP station	Failure	Rack error
	Vendor-specific diagnostics	- *
Head	Vendor-specific diagnostics	- *
Module	Removal/insertion of module or wrong module type	Component error
	Data record 0	Component error
	Channel error	Channel error
Diag. rep head	Specific errors of the diagnostic repeater	- *
Head ET 200 B, C, U, Eco	Disrupted	Component error
H-station	Failure	Rack error
Head H-station	Loss of redundancy	- *
PROFINET IO		
IO device	Failure	Rack error
IO device head module	Vendor-specific errors	- *
	Channel error	Channel error
	Maintenance	- *
	Data record 0	Component error
	Channel error for the entire head module (subslot = 0)	Component error
IO device head submodule (PDEV)	Channel error	Channel error
	Maintenance	- *
	Data record 0	Component error
	Channel error for the entire head submodule (subslot = 0)	Subcomponent error

Hardware	Error	Error class
Module	Removal/insertion of module or wrong module type	Component error
	Data record 0	Component error
	Channel error (channel 0...7FFF)	Channel error
	Channel error for the entire module (subslot = 0)	Component error
	Maintenance (channel 0...7FFF)	- *
	Maintenance (entire module)	- *
Submodule	Removal/insertion of module or wrong module type	Subcomponent error
	Data record 0	Component error
	Channel error (channel 0...7FFF)	Channel error
	Channel error for the entire submodule (subslot >= 1)	Subcomponent error
	Maintenance (channel 0...7FFF)	- *
	Maintenance (entire submodule)	- *
IE/PB-Link	Failure	Rack error
PROFIBUS station downstream from a link	Failure	Rack error
AS-i slave		
AS-i slave PROFIBUS/central channel error	Failure	- *
AS-i slave PROFINET module	Failure	- *

* The CPU does not change to STOP mode.

Note

In "startup" mode, the CPU does not change to STOP.

Settings for "PLC in STOP" (Page 638)

8.1.7 Displaying alarms

8.1.7.1 Overview of the alarm display

The "Alarm display" function can be used to output asynchronous alarms of diagnostics events and user-defined diagnostics alarms as well a alarms from ALARM instructions.

From the alarm display, you can also start the alarm editor with the "Edit alarm" shortcut menu command and then create user diagnostic alarms.

Icons

The following table shows the icons and their functions:

Icon	Function
Archive view	Shows the alarms located in the archive.
Active alarms	Shows the currently active (pending) alarms. Alarms that must be acknowledged are shown in bold characters.
Ignore	Ignores the arrival of alarms, These alarms are neither shown in the window nor stored in the archive.
Acknowledge	Confirms the selected alarm as read. Alarms requiring acknowledgment are shown in bold characters.
Clear archive	Deletes all alarms in the archive.
Export archive	Exports the current alarm archive to a file in xml format.
123 HEX Decimal/Hexadecimal	Displays the alarm numbers in decimal/hexadecimal notation.

8.1.7.2 Archive view

In the archive view, alarms are displayed and archived according to the time they appear. You can set the size of the archive (between 200 and 3000 alarms) with the menu command "Options > Settings > Online & Diagnostics". If the selected archive size is exceeded, the oldest alarm it contains is deleted.

Alarms that must be acknowledged are displayed in bold characters and can be acknowledged with the context menu command "Acknowledge alarm(s)".

The archive is constantly updated and does not need to be saved explicitly.

8.1.7.3 Layout of the alarms in the archive view

In the archive view, all events occurring on the selected CPUs are logged. A new entry is created for each individual event and shown as a further row in the table.

Table structure

All attributes of the alarms can be shown as columns. You can show or hide individual columns as well as modify the width and order of the columns. These settings are saved when the project is closed.

The alarms can be displayed in one or more rows. In the single row display, only the first row of the multiple-row alarm data is displayed.

The alarms either require acknowledgement or do not require acknowledgment. The alarms requiring acknowledgment that have not yet been acknowledged are highlighted in bold print and can be acknowledged either context-sensitive with the button in the toolbar or with the shortcut menu command "Acknowledge alarm(s)".

8.1.7.4 Receiving alarms

To allow alarms to be displayed, you must first set the receipt of alarms for each CPU.

Procedure

Toe receive alarms, follow these steps:

1. Double-click on the "Online & Diagnostics" folder of the relevant CPU in project navigation.
2. Click the "Settings" group in area navigation.
3. Select the option "Receive alarms".

Or:

1. Select the "Online & Diagnostics" folder of the relevant CPU in project navigation.
2. Open the "Online" menu and select "Receive alarms".

Or:

1. Select the relevant CPU in the device or network view.
2. Select the "Receive alarms" command in the context menu.

Or:

1. Select the CPU in project navigation.
2. Select the "Receive alarms" command in the context menu.

8.1.7.5 Export archive

To archive alarms, you can export the archive. Follow these steps:

1. Go to the archive view.
2. Click the "Export archive" button.
3. In the dialog that opens, select the path to export the archive.

Result

The archive is saved as an xml file at the location you selected.

8.1.7.6 Clear archive

The archive is organized as a ring buffer, in other words, when it is full, the oldest alarms are deleted from the archive. With the "Clear archive" button, you can delete the entire archive.

Procedure

To clear the archive, follow these steps:

1. Click the "Clear archive" button in the toolbar of the alarm display.

8.1.7.7 "Active alarms" view

The "Active alarms" view is an image of the alarm acknowledgement memory of the selected CPU(s).

8.1.7.8 Layout of the alarms in the "Active alarms" view

The "Active alarms" view represents an image of the alarm acknowledgement memory of the selected CPUs. One entry is shown in the table per active alarm. Events of an alarm ("incoming", "outgoing" and "acknowledged") are displayed in one row.

Table structure

All attributes of the alarms can be shown as columns. You can show or hide individual columns as well as modify the width and order of the columns. These settings are saved when the project is closed.

The alarms can be displayed in one or more rows. In the single row display, only the first row of the multiple-row alarm data is displayed.

The alarms either require acknowledgement or do not require acknowledgment. The alarms requiring acknowledgment that have not yet been acknowledged are highlighted in bold print and can be acknowledged either context-sensitive with the button in the toolbar or with the shortcut menu command "Acknowledge alarm(s)".

8.1.7.9 Status of the alarms

Depending on whether you are in the "Active alarms" view or the archive view, the displayed alarms may have a different status.

Status of the alarms in the "Active alarms" view

- I: Alarm came
- IA: Alarm came and was acknowledged
- IO: Alarm has gone

If more signal changes occur than can be sent (signal overflow), OV is displayed as the status and the status is shown in red.

Status of the alarms in the archive view

- No information: only with alarms generated by the PG/PC and displayed in the "Archive" tab, for example logon status, connection abort, mode changes
- I: Alarm came
- A: Alarm came and was acknowledged
- O Alarm has gone
- D: The alarm was deleted.

If more signal changes occur than can be sent (signal overflow), OV is displayed as the status and the status is shown in red.

8.1.7.10 Acknowledging alarms

Alarms that must be acknowledged are shown in bold characters.

Procedure

To acknowledge an alarm, follow these steps:

1. Select the required alarm or alarms from the table.
2. Click the "Acknowledge" button.

Note

You can select more than one alarm to acknowledge at the same time. To do this, hold down the <Ctrl> key and then select the alarms you want to acknowledge.

Result

The selected alarm was acknowledged and is then shown in normal characters.

Note

In the "Active alarms" view, acknowledged alarms that have already gone are no longer displayed.

8.1.7.11 Ignoring alarms

Ignoring alarms

To ignore alarms, follow these steps:

1. Click the "Ignore" button.

   The icon is shown on a gray background.

Result

From this point onwards, all alarms will be ignored. A message is created in the archive view indicating that the display of alarms and events is disabled.

Canceling the ignoring of alarms

To cancel the ignoring of alarms, follow these steps:

1. Click the "Ignore" button.

   The icon is shown on a white background.

Result

All alarms, in other words, even the alarms currently pending on the CPU while the "Ignore alarms" function was active, are displayed again from this point onwards. A message is created in the archive view indicating that the display of alarms and events is enabled again.

8.1.7.12 Keyboard commands in the alarm display

Alarm display

Function	Shortcut keys
Select all alarms	Ctrl+A
Acknowledge all selected alarms	Ctrl+Q

8.2 Device and network diagnostics

8.2.1 Hardware diagnostics

8.2.1.1 Overview of hardware diagnostics

Principal methods of hardware diagnostics

Principal methods of hardware diagnostics

Hardware diagnostics can be performed as follows:

- Using the Online and Diagnostics view
- Using the "Online Tools" task card
- Using the "Diagnostics > Device Info" area of the Inspector window
- Using diagnostics icons, for example, in the device view and the project tree

Structure of the Online and Diagnostics view

The Online and Diagnostics view consists of two windows alongside each other:

- The left window shows a tree structure with folders and - when you open the folder - groups.
- The right window contains detailed information on the selected folder or selected group.

The "Online access" group and the "Diagnostics" and "Functions" folders are located here:

- "Online access" group: Displays whether or not there is currently an online connection with the associated target. In addition, you can establish or disconnect the online connection.
- "Diagnostics": Contains several diagnostics groups for the selected module.
- "Functions": Contains several groups, in which you can make settings for the selected module or issue commands to the module.

Function and structure of the "Online Tools" task card

For modules with their own operating mode (such as CPUs), the "Online tools" task card allows you to read current diagnostics information and commands to the module.

If you selected a module without its own operating mode or if you selected several modules before activation of the "Online Tools" task card, the task card relates to the relevant CPU.

The "Online Tools" task card consists of the following panes:

- CPU control panel
- Cycle time
- Memory

Note

A pane is filled with content only if the module controls the associated functions and an online connection exists.

If there is no online connection to the respective module, the display "No online connection" appears in blue. If an existing online connection was disconnected, then "This target is not available" will be displayed.

Structure or the "Diagnostics" tab of the Inspector window

The "Diagnostics" tab of the Inspector window itself consists of several tabs: Of these tabs, the following is relevant for the hardware diagnostics.

- Device information

  This tab relates to all CPUs of the project to which the online connection is established. Alarms are reported here if one or more CPUs are defective or are not in RUN mode.

Determination of which of the devices that are connected online are defective

Overview of the defective devices

In the "Diagnostics > Device Info" area of the Inspector window you will obtain an overview of the defective devices that are or were connected online.

The "Diagnostics> Device Info" area of the Inspector window consists of the following elements:

- Header line with the number of defective devices
- Table with detailed information on each defective device

If you originate the establishment of an online connection to a device which is not reachable or reports one or more faults or is not in RUN mode, it will rank as defective.

Structure of the table with detailed information on the defective devices

The table consists of the following columns:

- Online status: Contains the online status as a diagnostic symbol and in words
- Operating mode: Contains the operating mode as a symbol and in words
- Device / module: Name of the affected device or the affected module
- Message: explains the entry of the previous column
- Details: The link opens the online and diagnostics view for the device, and places it in the foreground. If an online connection does not exist any longer, the link will open the connection establishment dialog.
- Help: The link supplies further information on the defect that has occurred.

See also

Determination of online status and display using symbols (Page 649)

Determination of online status and display using symbols

Determining diagnostics status online and displaying using icons

When the online connection to a device is established, the diagnostics status of the device and, if applicable, its subordinate components will be determined. The operating mode of the device is also determined, where applicable.

The following is a description of the symbols that are displayed in a specific view.

- Device view
  - The associated diagnostics icon is displayed for every hardware component (except the signal board on the CPU).
  - For hardware components with subordinate components, an "Error in subordinate component" diagnostics icon will also be displayed in the hardware component diagnostics icon if an error is present in at least one subordinate component.
  - For hardware components with their own operating mode, the operating mode icon will also be displayed to the left of or above the diagnostics icon.
- Device overview
  - The associated diagnostics icon is displayed for every hardware component.
  - For hardware components with subordinate components, an "Error in subordinate component" diagnostics icon will also be displayed in the bottom right corner of the hardware component diagnostics icon if an error is present in at least one subordinate component.

- Network view
  - The associated diagnostics icon is displayed for every device.
  - If an error is present in at least one subordinate component, then the "Error in subordinate component" diagnostics icon will also be displayed in the bottom right corner of the diagnostics icon.
- Network overview
  - The associated diagnostics icon is displayed for every hardware component.
  - For hardware components with subordinate components, an "Error in subordinate component" diagnostics icon will also be displayed in the bottom right corner of the hardware component diagnostics icon if an error is present in at least one subordinate component.
- Topology view
  - The associated diagnostics icon is displayed for every device.
  - If an error is present in at least one subordinate component, then the "Error in subordinate component" diagnostics icon will also be displayed in the bottom right corner of the diagnostics icon.
  - The associated diagnostics icon is displayed for every port.
  - Each cable between two online ports is assigned the color associated with its diagnostics status.
- Topological overview
  - The associated diagnostics icon is displayed for every hardware component.
  - For hardware components with subordinate components, an "Error in subordinate component" diagnostics icon will also be displayed in the bottom right corner of the hardware component diagnostics icon if an error is present in at least one subordinate component.
- Project tree
  - The associated diagnostics icon is displayed behind every hardware component.
  - For hardware components with subordinate components (e.g., distributed I/O, Slave_1), an "Error in subordinate component" diagnostics icon will also be displayed in the bottom right corner of the diagnostics icon if an error is present in at least one subordinate component.
  - For hardware components with their own operating mode, the operating mode icon is also displayed in the top right corner of the diagnostics icon.
  - If forcing is active on a CPU, then a red F will be displayed at the left margin of the diagnostics icon.

Diagnostics icons for modules and devices

The following table shows the available icons and their respective meaning.

Icon	Meaning
🖧	The connection with a CPU is currently being established.
🖧☒	The CPU is not reachable at the set address.
🖧	The configured CPU and the CPU actually present are of incompatible types.
🔒🖧	On establishment of the online connection to a protected CPU, the password dialog was terminated without specification of the correct password.
✓	No fault
🔧	Maintenance required
🔧	Maintenance demanded
🔧	Error
▯	The module or device is deactivated.
▯☒	The module or the device cannot be reached from the CPU (valid for modules and devices below a CPU).
▯!	Diagnostics data are not available because the current online configuration data differ from the offline configuration data.
▯	The configured module or device and the module or device actually present are incompatible (valid for modules or devices under a CPU).
▯?	The configured module does not support display of the diagnostics status (valid for modules under a CPU).
?	The connection is established, but the state of the module has not yet been determined.
⊘	The configured module does not support display of the diagnostics status.
!	Error in subordinate component: An error is present in at least one subordinate hardware component.

Note

Some modules, for example the FM 450-1, are only indicated as having a problem in the case of an error if you have enabled the diagnostics interrupt when setting the module properties.

Icons for the comparison status

The diagnostics icons can be combined at the bottom right with additional smaller icons that indicate the result of the online/offline comparison. The following table shows the available comparison icons and their meaning.

Icon	Meaning
❗	Folder contains objects whose online and offline versions differ (only in the project tree)
●	Online and offline versions of the object are different
◑	Object only exists online
◐	Object only exists offline
🟢	Online and offline versions of the object are the same

Note

If both a comparison icon and the "Error in subordinate component" diagnostics icon are to be displayed at the bottom right in the device view, the following rule applies: The diagnostics icon for the subordinate hardware component has a higher priority than the comparison icon. This means that a comparison icon is only displayed if the subordinate hardware components have no faults.

Combined diagnostics and comparison icons

The following table shows examples of icons that are displayed in the diagnostics icon.

Icon	Meaning
●	Folder contains objects whose online and offline versions differ (only in the project tree)
◑	Object only exists online

Operating mode icons for CPUs and CPs

The following table shows the available icons and their respective operating states.

Icon	Operating mode
🟩	RUN
🟨	STOP
🟨🟩	STARTUP
⏸	HOLD
🟥 ☒	DEFECTIVE
?	Unknown operating mode
⊘	The configured module does not support display of the operating mode.

Note

If forcing is active on a CPU, a red F will be displayed on a pink background at the bottom right of the operating mode icon.

Color marking of ports and Ethernet cables

The following table shows the available colors and their respective meaning.

Color	Meaning
🟩	No fault or maintenance required
🟨	Maintenance demanded
🟥	Communication error

Start online and diagnostics view

Overview of possible ways of starting the Online and Diagnostics view

You can start the Online and Diagnostics view of a module to be diagnosed at the following locations:

- Overview
- Project tree
- Device view
- Device overview
- Network view
- Network overview
- Topology view

In the following, examples are used to show how to proceed.

Requirement

The project with the module to be diagnosed is open.

Note

This requirement does not apply if you call the online and diagnostics view from the project tree after you have identified the accessible devices.

Procedure

To start the online and diagnostics view of a module, follow these steps:

1. In the project tree, open the respective device folder.
2. Double click on "Online & Diagnostics".

Or:

1. In the project tree, select the respective device folder.
2. Select the "Online & Diagnostics" command in the shortcut menu or the "Online" main menu.

Or:

1. In the project tree, open the "Online access" folder.
2. Open the folder for the interface with which you want to establish the online connection.
3. Double click on "Show/Update accessible devices".
4. Select the module to be diagnosed.
5. Select the "Online & Diagnostics" command in the shortcut menu or the "Online" main menu.

Or:

1. In the project tree, open the "Local modules" folder.
2. Select the respective device or the module that is to be diagnosed.
3. Select the "Online & Diagnostics" command in the shortcut menu or the main menu.

Or:

1. Open the device view in the device configuration.
2. Select the module to be diagnosed.
3. Select the "Online & Diagnostics" command in the shortcut menu or the "Online" main menu.

Or:

1. Open the device view in the device configuration.
2. Establish an online connection to the module to be diagnosed.
3. Double-click on the diagnostics icon above the module.

Or:

1. Open the network view in the device configuration.
2. Select the station with the module to be diagnosed.
3. Select the "Online & Diagnostics" command in the shortcut menu or the "Online" main menu.

Or:

Result

The online and diagnostics view of the module to be diagnosed will be started. If an online connection to the associated CPU had previously been created, the header bar of the Online and Diagnostics view will now have an orange background.

Note

If no online connection exists when the online and diagnostics view is started, no online information is displayed and the display fields remain empty.

Activation of the "Online Tools" task card

Activation of the "Online Tools" task card

You can activate this task card as follows:

1. Start the online and diagnostics view.
2. Click on the "Online Tools" task card.

Or:

1. Start the device view.
2. Click on the "Online Tools" task card.

Or:

1. Start the network view.
2. Click on the "Online Tools" task card.

8.2.1.2 Showing non-editable and current values of configurable module properties

Showing general properties and system-relevant information for a module

Where do I find the information I need?

The general properties and system-relevant information for a module can be found in the "General" group in the "Diagnostics" folder in the online and diagnostics view of the module to be diagnosed.

Structure of the "General" group

The "General" group consists of the following areas:

- Module
- Module information
- Vendor information

"Module" area

This area shows the following data of the module:

- Short designation, for example, CPU 1214C DC/DC/DC
- Order no.
- Hardware
- Firmware
- Racks
- Slot

"Module information" area

This area shows the following data of the module that you configured during hardware configuration:

- Module name
- Installation date (not displayed for all modules)
- Additional information (not displayed for all modules)

"Manufacturer information" area

This area shows the following data of the module:

- Manufacturer
- Serial number
- Profile: Profile ID as hexadecimal number

  Note

  You will find the corresponding profile name in the profile ID table for PROFIBUS International (see "www.profibus.com").

- Profile details: Profile-specific type as hexadecimal number

  ---

  Note

  You will find the corresponding profile-specific type name in the profile-specific type table for PROFIBUS International (see "www.profibus.com").

Display configured cycle times

Where do I find the information I need?

The required information can be found in the following places:

- In the "Cycle time" group of the "Diagnostics" folder in the Online and Diagnostics view of the module to be diagnosed.
- In the "Cycle time" pane of the "Online Tools" task card

Structure of the "Cycle time" group in the "Diagnostics" folder of the Online and Diagnostics view

The "Cycle time" group consists of the following areas:

- Cycle time diagram (graphical display of the assigned and measured cycle times)
- Cycle time configured (display of the assigned cycle times as absolute values)
- Cycle times measured (display of the measured cycle times as absolute values)

Structure of the "Cycle time" pane of the "Online Tools" task card

The "Cycle time" pane displays the cycle time diagram and below it the measured cycle times as absolute values.

Assigned cycle times

The following assigned cycle times are displayed in the cycle time diagram and in the "Cycle time configured" area.

- Minimum cycle time
- Maximum cycle time

In the cycle time diagram, the minimum cycle time and the maximum cycle time correspond to the two markings on the time axis.

In the "Cycle time configured" area, the assigned cycle times are displayed as absolute values.

Show interfaces and interface properties of a module

Where do I find the information I need?

The interfaces and interface properties of a module can be found in the "Diagnostics" folder in the Online and Diagnostics view of the module to be diagnosed in the following group:

- PROFINET interface

"PROFINET interface" group

This group is divided into the following areas:

- "Ethernet address" with the "Network connection" and "IP Parameters" subareas
- "Ports"

"Network connection" subarea of the "Ethernet address" area

This subarea shows the following data of the module:

- MAC Address:

  MAC address of the interface.

  The MAC address consists of two parts. The first part ("Basic MAC address") identifies the manufacturer (Siemens, 3COM, ...). The second part of the MAC address differentiates between the various Ethernet devices. Each Ethernet module is assigned a unique MAC address.

"IP Parameters" subarea of the "Ethernet address" area

This subarea shows the following data for the module:

- IP address:

  Internet protocol address of the device on the bus (TCP/IP)
- Subnet mask:

  The subnet mask shows which part of the IP address determines the membership of a particular sub-network.
- Default router:

  If the subnet is connected via a router to other subnets, the IP address of the default router must be known. This is the only way a datagram can be forwarded with a non-matching subnet address.
- IP settings:

  Identifier for the path by which the device has obtained its IP settings (IP address, subnet mask, default router).

Identifier	Meaning
0	IP address is not initialized
1	By configuration (i.e., by the configuration loaded to the device from the device or network view)
2	Via the "Assign IP address" group of the Online and Diagnostics view
3	Via the DHCP server (i.e., the IP parameters are obtained by a special service from a DHCP server (Dynamic Host Configuration Protocol) and assigned for a limited time)

- IP setting time:

  Time stamp of the last change to the IP address directly through the Ethernet connection of the module

"Ports" area

This area shows the following data for the module:

- Ethernet ports

  Physical properties of the PROFINET interface

Properties of the PROFINET interface	Meaning
Port no.	Port number The short description of interface (X + interface no.) and port (P + port no.) is specified in parentheses. An "R" in the short description of a port means that it is a ring port.
Status	Displays the status of the port LINK LED. • Status "OK" means another device (such as a switch) is connected to the port and the physical connection is available. • Status "disconnected" means no other device is connected to the port. • Status "deactivated" means that access to the port is blocked.
Customize	Individual network settings of the device (automatic or manual)
Mode	Network settings for the speed and the transmission process

If you select a line in the port table, additional help information will be provided for the corresponding port.

8.2.1.3 Showing the current values of dynamic modules properties

Display measured cycle times

Where do I find the information I need?

The measured cycle times can be found at each of the following places:

- In the "Cycle time" group of the "Diagnostics" folder in the Online and Diagnostics view of the module to be diagnosed.
- In the "Cycle time" pane of the "Online Tools" task card

Structure of the "Cycle time" group in the "Diagnostics" folder of the Online and Diagnostics view

The "Cycle time" group consists of the following areas:

- Cycle time diagram (graphical display of the assigned and measured cycle times)
- Cycle time configured (display of the assigned cycle times as absolute values)
- Cycle times measured (display of the measured cycle times as absolute values)

Structure of the "Cycle time" pane of the "Online Tools" task card

The "Cycle time" pane displays the cycle time diagram and below it the measured cycle times as absolute values.

Graphical display of the measured cycle times

The following measured cycle times are displayed in the cycle time diagram:

- Shortest cycle time: Duration of the shortest cycle since the last transition from STOP to RUN

  This corresponds to the dashed gray arrow on the left in the diagram.
- Current / last cycle time: Duration of the last cycle

  This corresponds to the green arrow in the diagram. If the current / last cycle time exceeds the maximum cycle time, the arrow will turn red.

Note

If the duration of the last cycle comes close to the maximum cycle time, it may be possible that it will be exceeded. Depending on the CPU type, parameter assignment and your user program, the CPU can switch to STOP mode. If for instance you are monitoring the tags in your program, this will increase the cycle time.

If the cycle lasts longer than double the maximum cycle time, and you do not restart the maximum cycle time in the user program (by calling the extended RE_TRIGR) instruction, the CPU will switch to STOP mode.

- Longest cycle time: Duration of the longest cycle since the last transition from STOP to RUN.

  This corresponds to the dashed blue arrow on the right in the diagram.

A blue band extends between the two dashed lines; this band corresponds to the entire range of the measured cycle times. If a measured cycle time is greater than the maximum cycle time, the portion of the band that lies outside the assigned limits will be colored red.

Display of the measured cycle times as absolute values

The following measured times are displayed in the "Cycle times measured" area and in the "Cycle time" pane.

- Shortest cycle time since the last transition from STOP to RUN.
- Current/last cycle time:
- Longest cycle time since the last transition from STOP to RUN.

Showing the current status of the LEDs of a CPU

Where do I find the information I need?

The current status of the LEDs of a CPU can be found in the display area of the "CPU control panel" pane of the "Online tools" task card.

Display area of the "CPU control panel" pane of the "Online Tools" task card

This area contains the following displays:

- Station name and CPU type (short designation)
- RUN / STOP (corresponds to the "RUN / STOP" LED of the CPU)
- ERROR (corresponds to the "ERROR" LED on the CPU)
- MAINT (corresponds to the "MAINT" LED on the CPU)

Showing fill levels of all types of memory on a CPU

Where do I find the information I need?

The fill levels of all types of memory on a CPU can be found on the following two pages:

- In the display area of the "Memory" group in the "Diagnostics" folder in the online and diagnostics view of the module to be diagnosed.
- In the "Memory" pane display area of the "Online Tools" task card

Display area of the "Memory" group in the "Diagnostics" folder of the online and diagnostics view

This area contains the current memory utilization of the respective module and details of the individual memory areas.

The memory utilization is shown both as a bar diagram and as a numerical value (percentage).

The following memory utilizations are shown:

- Load memory

  If no memory card is inserted, the internal load memory is displayed.

  If a memory card is inserted, the operating system only uses the inserted load memory as the load memory. This is displayed here.
- Work memory
- Retentive memory

Display area of the "Memory" pane of the "Online Tools" task card

This area contains the current memory utilization of the module. The available memory is shown both as a bar diagram and as a numerical value (percentage). The numerical value is rounded to an integer value.

Note

If a memory area is utilized to less than 1%, the available portion of this memory area is shown as "99%".

The following memory utilizations are shown:

- Load memory

  If no memory card is inserted, the internal load memory is displayed.

  If a memory card is inserted, the operating system only uses the inserted load memory as the load memory. This is displayed here.
- Work memory
- Retentive memory

See also

Load memory (Page 535)

Work memory (Page 535)

Retentive memory areas (Page 537)

8.2.1.4 Checking a module for defects

Determining the diagnostic status of a module

Where is the diagnostics status of a module displayed?

The diagnostic status of a module is displayed in the "Diagnostic status" group in the "Diagnostics" folder in the online and diagnostics view of the module to be diagnosed.

The "Diagnostics status" group consists of the following areas:

- Status
- Standard diagnostics (for S7-300 and S7-400 only for non-CPU modules)

"Status" area

The following status information is displayed in this area:

- Status of the module as viewed by the CPU, for example:
  - Module available and OK.
  - Module defective.

    If the module experiences a fault and you have enabled the diagnostic error interrupt during configuration, the "Module defective" status is displayed.
  - Module configured, but not available.
- Detected differences between the configured and the inserted module. Provided it can be ascertained, the order number will be displayed for the set and actual type.

The scope of the displayed information depends on the selected module.

"Standard diagnostics" area

The following diagnostics information for non-CPU modules is displayed in this area:

- Internal and external faults that relate to the overall module
- Associated diagnostics events

Examples of such diagnostics information are:

- Entire backup failed
- Module defective

Note

Diagnostic interrupts

A diagnostic interrupt can be reported to the CPU only if the module has diagnostic interrupt capability and the diagnostic interrupt has been enabled.

The display of the diagnostic interrupt is a snapshot. Sporadic module defects can be identified in the diagnostics buffer of the respective CPU.

Reading out the diagnostics buffer of a CPU

Where do you read out the diagnostics buffer of a CPU?

You read out the diagnostics buffer of a CPU in the "Diagnostics buffer" group in the "Diagnostics" folder in the Online and Diagnostics view.

Structure of the "Diagnostics buffer" group

The "Diagnostics buffer" group consists of the following areas:

- "Events"
- "Settings"

Diagnostics buffer

The diagnostics buffer is used as a log file for the diagnostics events that occurred on the CPU and the modules assigned to it. These are entered in the order of their occurrence, with the latest event shown at the top.

"Events" area

The "Events" area consists of the following elements:

- Check box "CPU time stamp takes into account local PG/PC time"
- Event table
- "Freeze display" or "Cancel freeze" button
- Details of the event: Event no., event ID, description, time stamp, incoming/outgoing information
- "Help on event", "Open block", "Save as ..." buttons

Check box "CPU time stamp takes into account local PG/PC time"

If you have not activated the check box, the diagnostics buffer entries are shown with the module time.

If you have activated the check box, the diagnostics buffer entries are shown with the time given by the following formula:

Displayed time = module time + time zone offset on your programming device / PC

This requires the module time to be identical to UTC.

You should use this setting if you wish to see the times of the diagnostics buffer entries for the module expressed in the local time of your programming device / PC.

Selecting or clearing the check box immediately changes the times displayed for the diagnostics buffer entries.

Note

If you use the "WR_SYS_T" instruction in your program or if you set the real-time clock of the CPU using an HMI device instead of using UTC, we recommend that you clear the "CPU time stamp takes into account local PG/PC time" check box. In this case, the module time is the sole time of concern.

Event table

The following information is displayed in the table for each diagnostics event:

- Sequential number of the entry

  The first entry contains the latest event.
- Date and time of the diagnostics event

  If no date and time are shown, the module has no integral clock.
- Short name of the event and, if applicable, the reaction of the CPU

  ### Note

  If an individual parameter of a text cannot be determined, the character string "###" is shown in its place.

  If no display text is yet available for new modules or new events, the numbers of the events and the individual parameters are stated as hexadecimal values.
- Icon for information related to incoming/outgoing status

  The following table shows the available icons and their respective meaning.

Icon	Meaning
✉←	Incoming event
✉→	Outgoing event
i	Incoming event to which there is no independent outgoing event
✉	User-defined diagnostics event

- For S7-1200 CPUs only: Icon for the severity of the event

  The following table shows the available icons and their respective meaning.

Icon	Meaning
✓	No maintenance and/or no fault
🔧	Maintenance required
🔧	Maintenance demanded
🔧	Error

You can change the order of the columns, adjust the column widths, and remove and add individual columns in the event table. Sorting is possible, but only by the sequential numbers.

"Freeze display" or "Cancel freeze" button

The "Freeze display" or "Cancel freeze" button is only enabled when there is an online connection to the CPU.

The default setting is "Freeze display".

The following happens when you click the "Freeze display" button:

- The current display of the diagnostics buffer entries is frozen.
- The labeling of the button changes to "Cancel freeze".

If an error has occurred in your system, diagnostics events can occur very quickly in succession. This produces a high update rate on the display. Freezing the display allows you to calmly examine the situation in more detail.

If the display is frozen and you click the "Cancel freeze" button, the following happens:

- The display of the diagnostics buffer entries is updated again.
- The labeling of the button changes to "Freeze display".

Note

If you freeze the diagnostics buffer display, the CPU continues to enter events in the diagnostics buffer.

Details of the event

If you select a line in the list of events, you will obtain detailed information on the respective event:

- Sequential number of the event in the diagnostics buffer.
- Event ID
- Description of the event with event-dependent additional information. Examples of this additional information:
  - Command that caused the event
  - Operating mode switch caused by the diagnostics event
- Time stamp
- For S7-1200 CPUs only: Associated I&M data (module, rack/slot, plant designation, location designation)
- Priority of the event
- Information on whether the event is an incoming or outgoing event

"Help on event" button

If you click on this button, the selected event is explained in more detail and any remedies given.

Note

If the selected event is not a CPU event, the "Help on event" button is unavailable.

"Open block" button

The following table shows if the "Open block" button is active and which function it conceals.

When is the "Open block" button active?	What happens when you click this button?
If the diagnostics event references the relative address of a block. This is the address of the command that caused the event.	The "Open block" function opens the referenced block in the offline view at the programming instruction that caused the error. This allows you to check and, if necessary, change the source code of the block at the specified place and then download it again to the CPU.
If the diagnostics event was triggered by a module.	The "Open block" function opens the Device view of the module involved.

"Save as ..." button

If you click this button, the content of the diagnostics buffer is saved in a text file. "Diagnostics", depending on the language, with the extension ".txt" is suggested as the file name. You can however change this name.

"Settings" area

The "Settings" area consists of the following elements:

- "Display events" list
- "Apply settings as default" button
- "Output event information in hexadecimal format" check box

"Display events:" list

There is an check box in this list for every event class (default setting: all check boxes are selected). If you clear a check box, the events of that event class will no longer be displayed in the "Events" area. Reselecting the check box will display the associated events once again.

"Apply settings as default" button

If you click this button, the settings will also apply to future occasions when the "Events" tab is opened.

"Output event information in hexadecimal format" check box

If you select the check box, the event IDs in the Events list of the "Events" area will be displayed in hexadecimal format. If you clear the check box, the event information is given in text form.

Basic information on the diagnostics buffer (Page 678)

8.2.1.5 Changing the properties of a module or the programming device / PC

Changing the mode of a CPU

Requirement

There is an online connection to the CPU whose mode you want to change.

Procedure

To change the mode of the CPU, follow these steps:

1. Enable the "Online tools" task card of the CPU.
2. Click the "RUN" button in the "CPU control panel" pane if you want to change the CPU to RUN mode or the "STOP" button if you want to change the CPU to STOP mode.

   Note

   The only button active is the one that can be selected in the current operating mode of the CPU.

3. Acknowledge the confirmation prompt with "OK".

Or:

1. Open the "Online" menu.
2. Choose the "Start CPU" menu command if you want to set the CPU to RUN mode and "Stop CPU" if you want to set the CPU to STOP mode.

   Note

   The only button that is active is the one that can be chosen in the current operating mode of the CPU.

3. Acknowledge the confirmation prompt with "OK".

Or:

1. Click the "Start CPU" button in the toolbar if you want to set the CPU to RUN mode and the "Stop CPU" button if you want to set the CPU to STOP mode.

   Note

   The only button that is active is the one that can be chosen in the current operating mode of the CPU.

2. Acknowledge the confirmation prompt with "OK".

Result

The CPU will be switched to the required operating mode.

Performing a memory reset

Requirement

- There is an online connection to the CPU on which the memory reset is to be performed.
- The CPU is in STOP mode.

Note

If the CPU is still in RUN mode and you start the memory reset, you can place it in STOP mode after acknowledging a confirmation prompt.

Procedure

To perform a memory reset on a CPU, follow these steps:

1. Enable the "Online Tools" task card of the CPU.
2. Click the "MRES" button in the "CPU control panel" pane.
3. Acknowledge the confirmation prompt with "OK".

Result

The CPU is switched to STOP mode, if necessary, and the memory reset is performed on the CPU.

See also

Basics of a memory reset (Page 532)

Determining and setting the time of day on a CPU

Where do I find the functions I need?

You determine and change the time of day on a CPU in the "Set time of day" group in the "Functions" folder of the Online and Diagnostics view. This requires an online connection.

Structure of the "Set time of day" group

The "Set time of day" group consists of the following areas:

- Area for reading out and setting the time of day
- Time system (This area does not exist for S7-1200 and will not be examined here.)

Structure of the area for reading out and setting the time of day

This area consists of the following parts:

- Programming device / PC time

  Here the time zone setting, the current date and the current time setting of your programming device / PC are displayed.
- Module time

  Here the date and time values currently read from the module (for example the CPU), are converted to local time and date and displayed.

  If the "Take from PG/PC" check box is selected, when you click the "Apply" button, the date and the PG/PC time converted to UTC are transferred to the module.

  If the "Take from PG/PC" check box is not selected, you can assign the date and time for the integrated clock of the module. After clicking the "Apply" button, the date and the time recalculated to UTC time are transferred to the module.

Assigning an IP address to a PROFINET IO device

Overview

All PROFINET IO devices work with the TCP/IP protocol and therefore require an IP address for operation on Industrial Ethernet. Once an IO device has been assigned an IP address, it can be accessed via this address. This step lets you download configuration data or perform diagnostics, for example.

You have two basic options for choosing an IP address:

- You assign the IP address yourself.
- You obtain the IP address from a DHCP server. (This is not possible for some IO devices.) In this case, the client ID, the MAC address, or the device name of the IO device is communicated to the DHCP server, depending on the option selected.

Both options are described below.

Requirement

- The Ethernet LAN connection must already be established.
- The Ethernet interface of your programming device or PC must be accessible.
- The IO device that is to be assigned an IP address must be in the same IP band as the programming device or PC.

Procedure for specifying the IP address yourself

To assign the IP address you have specified yourself to the IO device, proceed as follows:

1. Open the Online and Diagnostics view of the IO device.
2. Select the "Assign IP address" group from the "Functions" folder.
3. Select the "Use IP parameters" option.
4. Click the "Accessible devices" button to identify the devices that can be accessed via MAC addresses. After the search is complete, select the IO device with the MAC address known to you. The "IP address" entry field now contains the value configured for this IO device.
5. Check this value and correct it, if necessary.
6. Enter the subnet mask.
7. If a router is to be used, select the "Use router" check box and enter its IP address.
8. Click "Assign IP address".

Procedure for obtaining the IP address from from a DHCP server.

To assign an IP address specified by a DHCP server to the IO device, proceed as follows:

1. Open the Online and Diagnostics view of the IO device.
2. Select the "Assign IP address" group from the "Functions" folder.
3. Select the "Obtain IP address from a DHCP server" option.
4. If the DHCP server is to identify the target device using its client ID, choose the "Client ID" option. Enter the client ID in the entry field of the same name.

   Note

   The client ID is a string with a maximum of 63 characters. Only the following characters are permitted: a-z, A-Z, 0-9 and - (dash)

5. Alternatively: If the DHCP server is to identify the target device using its MAC address, choose the "MAC address" option. The "Accessible devices" button now becomes active, and you select the target device as described in section "Procedure for specifying the IP address yourself".

6. Alternatively: If the DHCP server is to identify the target device using its device name, choose the "Device name" option.

   Note

   If you specify that the DHCP server is to identify the target device using its device name, you must have assigned a device name to the target device beforehand.

   ---

7. Click "Assign IP address".

Result

The IP address will be assigned to the IO device.

Resetting a CPU to the factory settings

Requirement

- There is no memory card inserted in the CPU.
- There is an online connection to the CPU that you want to reset to the factory settings.
- The CPU is in STOP mode.

Note

If the CPU is still in RUN mode and you start the reset operation, you can place it in STOP mode after acknowledging a confirmation prompt.

Procedure

To reset a CPU to the factory settings, follow these steps:

1. Open the Online and Diagnostics view of the CPU.
2. Select the "Reset to factory settings" group from the "Functions" folder.

   Note

   The MAC address is not displayed for S7-1200 CPUs.

   ---

3. Select the "Retain IP address" check box if you want to retain the IP address or the "Delete IP address" if you want to delete the IP address.

   Note

   The two check boxes mentioned are only available if the module to be reset is able to choose whether to retain or delete the IP address.

   ---

4. Click the "Reset" button.
5. Acknowledge the confirmation prompt with "OK".

Result

The module is switched to STOP mode, if necessary, and the factory settings are then reset. This means:

- The work memory and the internal load memory and all operand areas are deleted.
- All parameters are reset to their defaults.
- The diagnostics buffer is cleared.
- The time of day is reset.
- The IP address is retained or deleted depending on the setting you make.

Assigning a PROFINET device name

Basic information on assigning a name to a PROFINET IO device

Device name

Before an IO device can be addressed by an IO controller, it must have a device name. This procedure was chosen for PROFINET because names are easier to handle than complex IP addresses.

Assigning a device name to a PROFINET IO device is comparable to setting the PROFIBUS address for a DP slave.

An IO device has no device name in its delivery state. For an IO controller to address an IO device, it must first be assigned a device name using the programming device or PC. It is now ready to transfer the configuration information including the IP address during startup or exchange user data in cyclic operation.

Rules for the device name

The device name is subject to the following limitations:

- Restricted to a total of 240 characters (lower case letters, numbers, dash, or dot)
- A name component within the device name, which is a character string between two dots, must not exceed 63 characters.
- No special characters such as umlauts, brackets, underscore, slash, blank space, etc. The only special character permitted is the dash.
- The device name must not begin or end with the "-" character.
- The device name must not begin with a number.
- The device name form n.n.n.n (n = 0, ... 999) is not permitted.
- The device name must not begin with the string "port-xyz" or "port-xyz-abcde" (a, b, c, d, e, x, y, z = 0, ... 9).

Where do I find the function I am seeking?

To assign a name to a PROFINET IO device, go to the "Assign name" group in the "Functions" folder of the Online and Diagnostics view for the device. The user interface for this group differs depending on how you open the Online and Diagnostics view:

- Call from project navigation (using "Update accessible devices") or via the "Online" menu
- Call from within the project context

See also

Calling the name assignment function from the project tree or via the "Online" menu (Page 676)

Calling the name assignment function from within the project context (Page 677)

Calling the name assignment function from the project tree or via the "Online" menu

Requirement

- You have opened the Online and Diagnostics view of the PROFINET IO device from the project tree or with the "Online" menu.

Procedure

1. Open the "Functions" folder and the "Assign name" group inside this folder. The "Type" field displays the module type of the PROFINET IO device.
2. Enter the required device name in the "PROFINET device name" input box.
3. Optional: Click the "Flash LED" button on the left of the graphic to run an LED flash test for the PROFINET IO device. In this way you verify that you are naming the desired IO device.

Note

The LED flash test is not supported by all PROFINET IO devices.

4. Click "Assign name".

Result

The entered name is assigned to the PROFINET IO device.

Calling the name assignment function from within the project context

Requirement

- An online connection to the PROFINET IO device is not required.
- You have opened the Online and Diagnostics view of the PROFINET IO device from within the project context.
- The PROFINET IO device can be accessed using at least one PG/PC.

Procedure

1. Open the "Functions" folder and the "Assign name" group inside this folder. The "PROFINET device name" drop-down list displays the current name in the offline project, and the "Type" box shows the module type of the PROFINET IO device.
2. Choose a different name from the drop-down list, if necessary.

Note

In steps 3 to 5, you determine the IO devices that are present in the PROFINET subnet.

3. In the "PG/PC interface for assignment" drop-down list, select the PG/PC interface you want to use to establish the online connection.
4. Optional: Use the three check boxes to make a selection from all IO devices available online.
5. Click the icon for determining the IO devices present in the PROFINET subnet. The table is then updated.
6. Select the desired IO device in the table.
7. Optional: Click the "Flash LED" button to run an LED flash test for the PROFINET IO device. In this way you verify that you are naming the desired IO device.

Note

The LED flash test is not supported by all PROFINET IO devices.

8. Click "Assign name".

Result

The selected name is assigned to the PROFINET IO device.

8.2.1.6 Diagnostics in STOP mode

Basic information on the diagnostics buffer

Function

The operating system of the CPU enters the errors detected by the CPU and the diagnostics-capable modules into the diagnostics buffer in the order in which they occurred. This includes the following events:

- Every mode change of the CPU (POWER UP, change to STOP mode, change to RUN mode)
- Every hardware and diagnostic error interrupt

The top entry contains the most recent event. The entries in the diagnostics buffer are stored permanently. They are retained even if the power supply fails and can only be deleted by resetting the CPU to factory settings.

A diagnostics buffer entry contains the following elements:

- Time stamp
- Error ID
- Additional information specific to the error ID

Advantages of the diagnostics buffer

The diagnostics buffer offers the following advantages:

- After the CPU has changed to STOP mode, you can evaluate the last events prior to the STOP so that you can locate and identify the cause of the STOP.
- You can detect and eliminate the causes of errors more quickly and thus increase the availability of the system.
- You can evaluate and optimize the dynamic system response.

Organization of the diagnostics buffer

The diagnostics buffer is a ring buffer. The maximum number of entries for the S7-1200 CPUs is 50. When the diagnostics buffer is full and a further entry needs to be made, all existing entries are shifted by one position (which means that the oldest entry is deleted) and the new entry is made at the top position that is now free (FIFO principle: first in, first out).

Evaluation of the diagnostics buffer

The contents of the diagnostics buffer can be accessed as follows:

- Using the Online and Diagnostics view

The evaluation of events occurring prior to the error event (e.g., transition to STOP mode) allows you to obtain a picture of the possible causes or to zero in more closely or specify in more detail the possible causes (depending on the error type).

Read the detailed information about the events carefully and use the "Help on event" button to obtain additional information and possible causes of individual entries.

Note

To make the best use of the time stamp information on the diagnostics buffer entries in time-critical systems, it is advisable to check and correct the date and time of day on the CPU occasionally.

Alternatively, it is possible to perform a time-of-day synchronization using an NTP time server.

Resetting a CPU to the factory settings (Page 674)

Determining the cause of a STOP of a CPU (Page 679)

Determining and setting the time of day on a CPU (Page 672)

Parameterizing the clock (Page 555)

Determining the cause of a STOP of a CPU

Requirement

The CPU you want to analyze is in STOP mode.

Procedure

To find out the reason why a CPU changed to STOP, follow these steps:

1. Open the online and diagnostics view of the CPU.
2. Select the "Diagnostics buffer" group from the "Diagnostics" folder.
3. Evaluate the events occurring prior to the transition to STOP mode. Use this to obtain a picture of the possible causes or to zero in on or specify in more detail the possible causes (depending on the error type).

   Read the detailed information about the events carefully and use the "Help on event" button to obtain additional information and possible causes of individual entries.

Result

You were able to zero in on or determine in more detail the cause of the CPU STOP.

Note

If the analysis does not enable you to overcome the problem, contact Customer Support. In this case, use the "Save as" button to back up the content of the diagnostics data to a text file and submit it to Customer Support.

Reading out the diagnostics buffer of a CPU (Page 665)

8.2.1.7 Online accesses in the Online and Diagnostics view

Displaying status of the online connection

Requirement

- The associated device can be accessed using at least one PG/PC interface.

Procedure

1. Open the Online and Diagnostics view for the device whose online connection status you want to display.
2. Select the "Online access" group.

Note

The "Online access" group exists only for CPUs. However, if you have opened the Online and Diagnostics view using the "Show/update accessible devices" function, it will not be displayed.

Result

The status of the online connection is displayed in the "Status" area both graphically and in text form.

Specifying a PG/PC interface, going online

Requirement

- The associated device can be accessed using at least one PG/PC interface.
- There is currently no online connection to the relevant device.

Procedure

1. Open the Online and Diagnostics view of the device to which you want to establish an online connection.
2. Choose the "Online access" group and the "Online access" area within this group.

Note

The "Online access" group exists only for CPUs. However, if you have opened the Online and Diagnostics view using the "Show/update accessible devices" function, it will not be displayed.

3. If an online connection was established previously for the device, the associated data for this online connection will be preset in the drop-down lists. In this case, you can skip directly to the last step of this operating instruction.
4. Choose the interface type in the "Type of PG/PC interface" drop-down list.

   The "PG/PC interface for online access" drop-down list then shows only the interfaces of the programming device or PC that match the selected interface type.
5. In the "PG/PC interface for online access" drop-down list, select the programming device or PC interface via which you want to establish the online connection.
6. Optional: Click the "Properties" button to change the properties of the associated CP.
7. In the "Connection to subnet" drop-down list, select the subnet via which the device is connected to the PG/PC interface. If the device is connected directly to the PG/PC interface, select the "Local" setting.
8. If the device is accessible via a gateway, select the gateway that connects the two subnets involved in the "1st gateway" drop-down list.
9. In the "Device address" entry field, enter the IP address of the device to which you want to establish an online connection.
10. Alternatively: Click the "Show accessible devices" button and choose the device from the list of accessible devices to which you want to establish an online connection.
11. Click the "Go online" button.

Result

The online connection to the desired device will be established.

Going offline

Requirement

- There is currently an online connection to the relevant device.

Procedure

1. Open the Online and Diagnostics view of the device for which you want to disconnect the online connection.
2. Choose the "Online access" group and the "Online access" area within this group.

   Note

   The "Online access" group exists only for CPUs. However, if you have opened the Online and Diagnostics view using the "Show/update accessible devices" function, it will not be displayed.

3. Click the "Go offline" button.

Result

The online connection to the desired device will be disconnected.

Performing the flash test for a device with an online connection

Requirement

- There is currently an online connection to the relevant device.

Procedure

1. Open the Online and Diagnostics view of the device for which you want to perform a flash test.
2. Choose the "Online access" group and the "Status" area within this group.

   Note

   The "Online access" group exists only for CPUs. However, if you have opened the Online and Diagnostics view using the "Show/update accessible devices" function, it will not be displayed.

3. Click the "LED Flash test" button.

Result

- On an S7-1200 CPU, the RUN/STOP, ERROR and MAINT LEDs flash.
- On an S7-300 or S7-400 CPU, the FRCE LED flashes.

Note

The flash test cannot be performed when the FORCE function is active.

8.2.1.8 Checking PROFIBUS DP subnets for faults

Basic information on the diagnostic repeater

What is the diagnostic repeater?

The diagnostic repeater is a repeater that can monitor a segment of an RS 485 PROFIBUS subnet (copper cable) during operation and signal line errors to the DP master via a diagnostics message frame.

The diagnostic repeater detects, localizes and visualizes line errors during operation at an early stage. As a result, problems in the system are identified early and production downtimes will be minimized.

Function of the diagnostic repeater

The diagnostic repeater can perform line diagnostics on the DP2 and DP3 segments because it has a measuring circuit for these segments.

The line diagnostics run in two steps:

- Step 1: Topology determination

  You start the topology determination by calling the "DP_TOPOL" instruction in your program.

  The diagnostic repeater then determines the PROFIBUS addresses and the distance of the devices and creates a topology table.

- Step 2: Error localization

  The diagnostic repeater checks the lines during operation. It determines the distance to the point of the error and the reason for the error; it then issues a diagnostics alarm with relative information on the error location.

Display of detailed information on the determined error location

You receive detailed information on the determined error location in the Online and Diagnostics view of the diagnostic repeater.

- By means of icons
- By means of a display with graphics and text

See also

Displaying the status of the segment diagnostics using icons (Page 684)

Displaying the status of the segment diagnostics using graphics and text (Page 684)

Displaying the status of the segment diagnostics using icons

Where do I find the information I need?

The icons for the status of the segment diagnostics are available:

- In the expanded "Segment diagnostics" folder in the navigation pane of the Online and Diagnostics view of the relevant diagnostic repeater.

The diagnostics icon associated with the segment will be displayed behind the segment designation. It must be noted here that line errors will be displayed for the DP2 and DP3 segments only. The DP1 and programming device segments do not display errors in the form of a diagnostics icon; rather, they signal only a few bus errors.

Diagnostics icons

The following table shows the available icons and their meaning.

Icon	Meaning
✅	Segment is error-free
🔧	Segment contains errors
⊽	Segment is deactivated

Displaying the status of the segment diagnostics using graphics and text

Where is the status of the segment diagnostics displayed with graphics and text?

The status of the segment diagnostics will be displayed using graphics and text in the "DP1", "DP2", "DP3", and "PG" groups of the "Segment diagnostics" folder in the Online and Diagnostics view of the relevant diagnostic repeater.

Structure of the "DP1", "DP2" "DP3", and "PG" groups

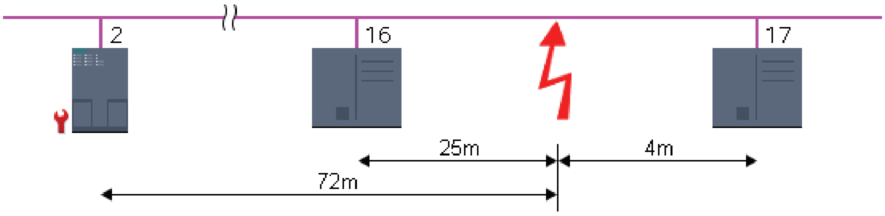
The "DP1", "DP2", "DP3", and "PG" groups consist of the following elements:

- "Error location" field
- "Error" field
- "Resolution" field
- "Help on event" button
- "Freeze display" or "Cancel freeze" button

"Error location" field

This field displays the error location graphically, provided the diagnostic repeater can determine the location.

The following picture shows an example for a line error occurring in the DP2 segment.



In this example, the diagnostic repeater has the PROFIBUS address 2, and a line error has occurred between the devices with PROFIBUS addresses 16 and 17. This line error is located 25 m from device 16, 4 m from device 17, and 72 m from the diagnostic repeater.

"Error" field

The error is explained in plain text in this field.

"Resolution" field

Here, you will find actions for resolving the error.

"Help on event" button

Click this button to obtain a more detailed explanation of the error and additional details on resolving the error, if applicable.

"Freeze display" or "Cancel freeze" button

The "Freeze display" or "Cancel freeze" button is only enabled when there is an online connection to the diagnostic repeater.

The default setting is "Freeze display".

The following happens when you click the "Freeze display" button:

- The current display of the segment diagnostics is frozen.
- The labeling of the button changes to "Cancel freeze".

If the display is frozen and you click the "Cancel freeze" button, the following happens:

- The display of the segment diagnostics is updated again.
- The labeling of the button changes to "Freeze display".

8.2.2 Connection diagnostics

8.2.2.1 Overview of connection diagnostics

Basics

Connection diagnostics, as described below, refers to the diagnostics of communication connections.

The connection diagnostics is started each time an online connection is established to a module (CPU or CP) that participates in one or more communication services. The connection status is updated automatically in the background.

In the case of one-way connections, an online connection must exist to the communication partner that has established the communication connection.

On connections configured at both ends, a distinction between the following two situations must be made:

- If there is an online connection to only one connection endpoint, only the part of the connection belonging to this connection endpoint can be diagnosed.
- If there is an online connection to both connection endpoints, both parts of the connection (and therefore the entire connection) can be diagnosed.

Basic connections diagnostics options

Connection diagnostics can be performed as follows:

- Using icons on the connection status display

  This display is generated in the connection table.
- Through detailed connection diagnostics

  This step is available in the "Diagnostics > Connection information" area of the Inspector window.

Requirement for the connection diagnostics described below

You can display the details of either all the communication connections created in the project (default) or selected communication connections in the connection table.

The connection diagnostics described in the following assume that you display the details of selected communication connections. To do this, clear the "Show all connections" option in the shortcut menu.

8.2.2.2 Displaying the connection status using icons

Content of connection table without an online connection

For a CPU or CP, the connection table lists the communication connections (including properties) configured offline, if an online connection is not established. For S7-1200, the following connections are listed:

- Configured S7 connections (for S7-1200 these are configured only with the PUT and GET instructions)
- HMI connections

Content of connection table with an online connection

After the online connection has been established, the properties of the communication connections listed offline will be expanded to include diagnostics icons for the connection status ("Online status" column).

In addition, entries for all communication connections that exist online only (e.g., connections configured using open user communication instructions, PG and OP connections) will now be added to the connection table.

For connections that exist online or offline only, the diagnostics icon at the bottom right is combined with a smaller additional comparison status icon.

Diagnostics icons for communication connections

The following table shows the diagnostics icons for communication connections.

Icon	Meaning
✅	Connection setup
🔧	Connection not setup / is being setup
❔	Connection not available

Diagnostics icons for the comparison status

The diagnostics icons for communication connections can be combined at the bottom left with additional smaller icons that indicate the result of the online/offline comparison. The following table shows the available comparison icons and their meaning.

Icon	Meaning
◑	Connection exists online only
◐	Connection exists offline only

8.2.2.3 Detailed connection diagnostics

Detailed connection diagnostics - overview

Where do I perform detailed connection diagnostics?

To perform detailed connection diagnostics, go to the "Diagnostics > Connection" information of the Inspector window.

How do I open the "Diagnostics > Connection information" area of the Inspector window?

The following options are available for opening the "Connection information" tab of the Inspector window.

- Select the line of the relevant connection in the connection table. Click the "Diagnostics" and "Connection information" tabs one after the other in the Inspector window.
- Double-click the diagnostics icon of the relevant connection in the connection table.
- This step takes you to the programming editor for a S7 communication instruction or open user communication instruction. Double-click the diagnostics icon of the instruction (3 squares back-to-back at an angle in green, yellow, red).

Structure or the "Diagnostics > Connection information" area of the Inspector window

Requirements: the content of the "Connection information" tab has been filled, and an online connection to at least one end point of the relevant connection has been established.

If a module has been selected (network view), the tab will contain the following group:

- Connection resources (for S7-1200 only)

If a connection has been selected (connection table), it will contain the following groups:

- Connection details
- Address details of the connection (for S7-1200 only)

Determining connection resources

Where do I determine connection resources?

The connection resources are obtained in the "Connection resources" group. This group is located in the "Diagnostics > Connection information" area of the Inspector window. It is displayed only if you have selected a module in the Network view.

Number of connection resources

- Maximum number: Specifies the maximum number of available connection resources of the module.
- Not assigned: Indicates how many connection resources are not yet assigned. If connection resources are already reserved for certain types of communication, then the unreserved connection resources cannot always be used for the various connection types.

Reserved and currently assigned connection resources

For the communication types indicated below, the connection resources that are reserved and currently assigned by the module will be displayed.

Communication type	Meaning
PG communication	Resources for connections between the module and programming devices (for example, for the establishment of a connection from the project tree, for online diagnostics, etc.)
HMI communication	Resources for connections between the module and HMI devices
Open user communication	Resources for connection of open user communication instructions
S7 communication	Resources for configured S7 connections, through which data can be exchanged by calling instructions in the user program.
Other communication	Specifies other assigned connection resources for which connection resources are not reserved.

Determining connection details

Where do I determine the connection details?

The connection details are obtained in the "Connection details" group. This group is located in the "Diagnostics > Connection information" area of the Inspector window.

When is the "Connection details" group filled in?

The following requirements must be met to fill in the "Connection details" group on the "Connection information" tab:

- An online connection to the end point of the relevant connection must exist.
- You have selected a line in the connection table.

Structure of the "Connection details" group

The "Connection details" group consists of the following elements:

- Local ID (hex)
- Connection type (for S7-1200 only)
- Protocol
- Connection status: icon and description
- Details
- Last status change (for S7-300 and S7-400 only)

Determining the address details of a connection

Where do I determine the address details of a connection?

The address details of a connection are obtained in the "Address details for connection" group. This group is located in the "Diagnostics > Connection information" area of the Inspector window.

For which CPUs is the "Address details for connection" group available?

The "Address details for connection" group of the "Connection information" tab is available for S7-1200 CPUs only.

When is the "Address details for connection" group filled in?

The following requirements must be met to fill in the "Address details for connection" group on the "Connection information" tab:

- An online connection to the end points of the relevant connection must exist.
- You have selected a line in the connection table.

Structure of the "Address details of connection" group

The following information is specified for the two communication partners:

- Endpoint
- Interface (not for remote partner)
- Subnetwork (not for remote partner)
- Address
- TSAP
- Protocol
- Active connection setup: Yes/no

Programming a PLC 9

9.1 Creating a user program

9.1.1 Programming basics

9.1.1.1 Operating system and user program

Operating system

Function

Every CPU comes with an integrated operating system that organizes all CPU functions and sequences not associated with a specific control task.

The tasks of the operating system, for example, include the following:

- Handling Warm restart (Page 528)
- Updating the process image of the inputs and outputs
- Calling the user program
- Detecting interrupts and calling interrupt OBs
- Detecting and handling errors
- Managing memory areas

The operating system is a component of the CPU and is already installed there upon delivery.

See also

User program (Page 694)

User program

Function

The user program contains all functions that are necessary for processing your specific automation task.

The tasks of the user program include:

- Checking the requirements for a (warm) restart using startup OBs, for example, limit switch in correct position or safety relay active.
- Processing process data, e.g. linking binary signals, reading in and evaluating analog values, defining binary signals for output, and outputting analog values
- Reaction to interrupts, for example, diagnostic error interrupt if the limit value of an analog expansion module is overshot.
- Error handling in normal program execution

You write the user program and load it into the CPU.

See also

Operating system (Page 693)

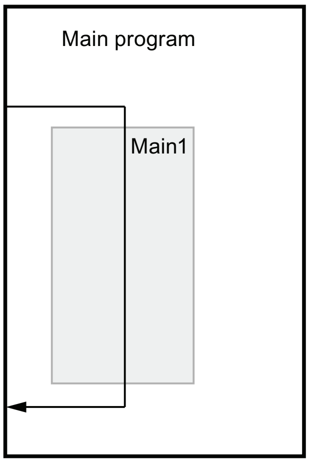
9.1.1.2 Blocks in the user program

Linear and structured programming

Linear programming

Solutions for small automation tasks can be programmed linearly in a program cycle OB. This is only recommended for simple programs.

The following figure shows a linear program schematically: The "Main1" program cycle OB contains the complete user program.



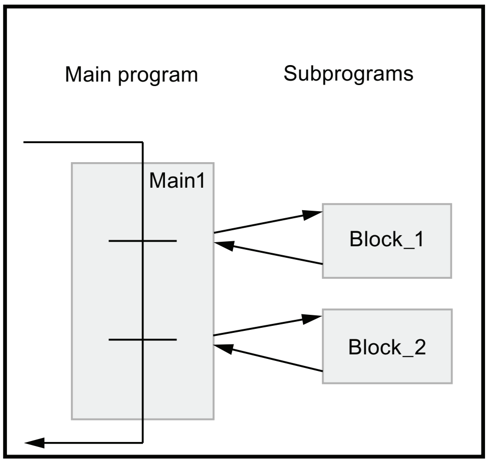
Structured programming

Complex automation tasks can be more easily handled and managed by dividing them into smaller sub-tasks that correspond to the technological functions of the process or that can be reused. These sub-tasks are represented in the user program by blocks. Each block is then an independent section of the user program.

Structuring the program offers the following advantages:

- Extensive programs are easier to program through the structure.
- Individual program sections can be standardized and used repeatedly with changing parameters.
- Program organization is simplified.
- Changes to the program can be made more easily.
- Debugging is simplified since separate sections can be tested.
- Commissioning is simplified.

The following figure shows a structured program schematically: The "Main1" program cycle OB calls subprograms one after the other that execute defined subtasks.



Overview of the block types

Block types

Different BLOCK types are available to perform tasks within an automation system. The following table shows the available block types:

Block type	Brief description
Organization blocks (Page 696) (OB)	Organization blocks define the structure of the user program.
Functions (Page 697) (FC)	Functions contain program routines for recurring tasks. They have no "memory".
Function blocks (Page 697) (FB)	Function blocks are code blocks that store their values permanently in instance data blocks, so that they remain available even after the block has been executed.
Instance data blocks (Page 699)	Instance data blocks are assigned to a function block when it is is called for the purpose of storing program data.
Global data blocks (Page 698)	Global data blocks are data areas for storing data that can be used by any blocks.

Organization blocks (OB)

Definition

Organization blocks (OBs) form the interface between the operating system and the user program. They are called by the operating system and control, for example, the following operations:

- Startup characteristics of the automation system
- Cyclic program processing
- Interrupt-driven program execution
- Error handling

You can program the organization blocks and at the same time determine the behavior of the CPU. Various organization blocks are available to you depending on the CPU used.

For more information on organization blocks, refer to the descriptions of the mode of operation of the CPUs in the References section of "Configuring Hardware and Networks".

Start information of organization blocks

At the start of many organization blocks the operating system outputs information that can be evaluated in the user program. The descriptions of the organization blocks contain information on whether information is output and on which information is output.

See also

Creating organization blocks (Page 844)

Functions (FCs)

Definition

Functions (FCs) are logic blocks without memory. After the function has been executed, the data in the temporary variables is therefore lost. Functions can use global data blocks to store data permanently.

Application

A function contains a program that is executed when the function is called by another logic block. Functions can be used, for example, for the following purposes:

- To return function values to the calling block, e.g. for mathematical functions
- To execute technological functions, e.g. individual controls using bit logic operations

A function can also be called several times at different points in a program. As a result, they simplify programming of frequently recurring functions.

See also

Creating functions and function blocks (Page 845)

Function blocks (FB)

Definition

Function blocks are logic blocks that store their input, output and in-out parameters permanently in instance data blocks, so that they remain available even after the block has been executed. Therefore they are also referred to as blocks "with memory".

Function blocks can also operate with temporary tags. Temporary tags are will not be stored in the instance DB, but are available for one cycle only.

Application

Function blocks contain subroutines that are always executed when a function block is called by another logic block. A function block can also be called several times at different points in a program. As a result, they simplify programming of frequently recurring functions.

Instances of function blocks

A call of a function block is referred to as an instance. The instance data is assigned to each instance of a function block with which the function block operates. The instance data can be declared in a data block (instance data block) or in the data of the calling block.

Access modes

S7-1200 offers to different access options for the instance data blocks, which can be assigned to a function block when this is called:

- Data blocks with optimized access

  Data blocks with optimized access have no fixed defined structure. The declaration elements contain only one symbolic name in the declaration, no fixed addressing within the block.

- Data blocks with standard access (compatible with S7-300/400)

  Data blocks with standard access have a fixed structure. The declaration elements contain both a symbolic name in the declaration and a fixed address within the block.

Note

To avoid errors when working with function blocks, refer to the section "Parameter transfer at block call (Page 707)".

See also

Creating functions and function blocks (Page 845)

Multi-instances (Page 706)

Instance data blocks (Page 699)

Basics of block access (Page 700)

Global data blocks (DB)

Definition

Data blocks are used to store program data. Data blocks thus contain variable data that is used by the user program. Global data blocks store data that can be used by all other blocks.

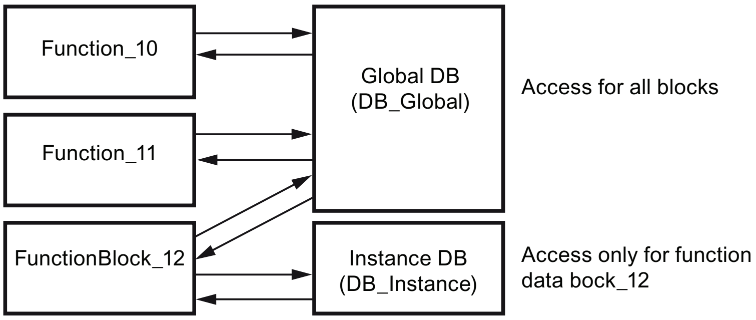
The maximum size of data blocks varies depending on the CPU. You can define the structure of global data blocks anyway you please.

You also have the option of using PLC data types (UDT) as a template for creating global data blocks.

Global data blocks in the user program

Every function block, function, or organization block can read the data from a global data block or can itself write data to a global data block. This data remains in the data block even after the data block is exited. A global data block and an instance data block can be open at the same time.

The following figure shows the different accesses to data blocks:



Access modes

S7-1200 offer two different access options for global data blocks:

- Data blocks with optimized access

  Data blocks with optimized access have no fixed defined structure. The declaration elements contain only one symbolic name in the declaration, no fixed addressing within the block.
- Data blocks with standard access

  Data blocks with standard access have a fixed structure. The declaration elements contain both a symbolic name in the declaration and a fixed address within the block.

See also

Creating data blocks (Page 846)

Basics of block access (Page 700)

Instance data blocks

Definition

The call of a function block is referred to as an instance. The data with which the instance works is stored in an instance data block.

The maximum size of instance data blocks varies depending on the CPU. The variables declared in the function block determine the structure of the instance data block.

Access modes

S7-1200 offers to different access options for the instance data blocks, which can be assigned to a function block when this is called:

- Data blocks with optimized access

  Data blocks with optimized access have no fixed defined structure. The declaration elements contain only one symbolic name in the declaration, no fixed addressing within the block.

- Data blocks with standard access

  Data blocks with standard access have a fixed structure. The declaration elements contain both a symbolic name in the declaration and a fixed address within the block.

See also: Call function blocks as single or multi-instances (Page 704)

See also

Creating data blocks (Page 846)

Basics of block access (Page 700)

Blocks with optimized access

Basics of block access

Introduction

S7-1200 provides data blocks with different access options:

- Data blocks with optimized access
- Data blocks with standard access

When you create a global data block or a function block, you can define the type of access of the global data block or the instance data block that will be assigned to the FB.

Within one program you can randomly combine the two types of blocks. You define the access type bindingly when you create the block. It is not possible to subsequently change the access type.

Data blocks with optimized access

Data blocks with optimized access have no fixed defined structure. The declaration elements contain only one symbolic name in the declaration, no fixed addressing within the block. The elements are saved automatically in the available memory area in such a way as to make optimal use of this area's capacity.

Variables in these data blocks can only be addressed in symbolic form. For example, you access the "Fill Level" variable in the "Data" DB as follows:

```
"Data".Fill Level
```

The optimized access offers the following advantages:

- The data are structured and stored in a way that is optimal for the CPU used. This allows you to increase the performance of the CPU.
- Access errors, from the HMI for example, are not possible.
- You can define specific individual variables as retentive.

Data blocks with standard access

Data blocks with standard access have a fixed structure. The declaration elements contain both a symbolic name in the declaration and a fixed address within the block. The address is shown in the "Offset" column.

Variables in these data blocks can be addressed in both symbolic and absolute form.

```
"Data".Fill Level
DB1.DBW2
```

Retentivity for optimized block access

In data blocks with optimized access you can define the retentive behavior of individual tags.

For structured data type tags, the retentivity setting always applies to the entire structure. You cannot make any individual retentivity setting for separate elements within the data type.

If a variable or structure is defined as retentive it is automatically stored in the retentive memory area of the data block.

Retentivity for Standard Access

In data blocks with standard access, you cannot set the retentive behavior of individual tags. The retentivity setting is valid for all variables of the data block.

9.1.1.3 Block calls

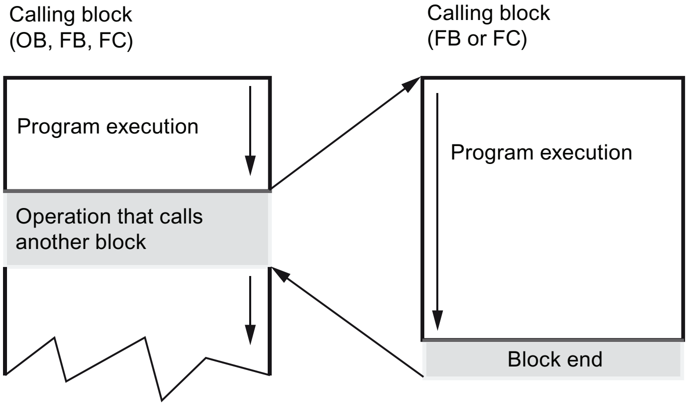
Principles of block calls

Function of block calls

For your blocks to be executed in the user program, they need to be called from another block.

When one block calls another block, the instructions of the called block are executed. Only when execution of the called block has been completed does execution of the calling block resume. The execution is continued with the instruction that follows on the block call.

The following figure shows the sequence of a block call within a user program:



Parameter transfer

When a block is called, you must assign values to the parameters in the block interface. By providing input parameters you specify the data with which the block is executed. By providing the output parameters you specify where the execution results are saved.

See also

Call hierarchy (Page 703)

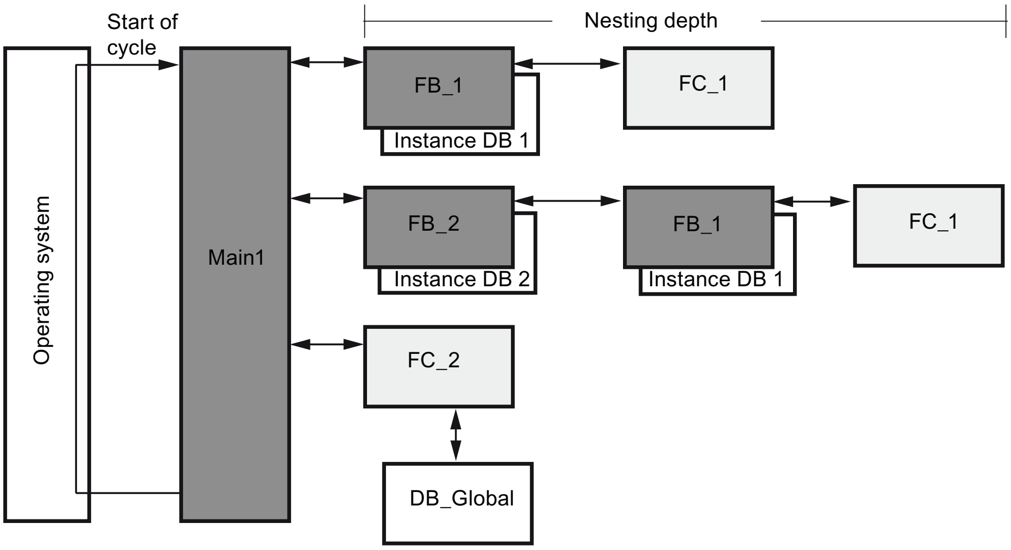
Principles for single instances and multi-instances (Page 704)

Call hierarchy

Definition

The order and nesting of block calls is referred to as the call hierarchy. The permissible nesting depth depends on the CPU.

The following figure shows an example of the order and nesting of block calls within an execution cycle:



See also

Principles for single instances and multi-instances (Page 704)

Principles of block calls (Page 702)

Call function blocks as single or multi-instances

Principles for single instances and multi-instances

Use of single instances and multi-instances

Function blocks (FBs) store their data in instance data blocks. Instance data blocks store the values of the block parameters and the static local data of the function blocks.

You can assign instance data blocks as follows:

- Single instance:

  One instance data block for each instance of a function block
- Multi-instance:
  - One instance data block for multi-instances of a function block
  - One instance data block for several instances of different function blocks

See also

Principles of block calls (Page 702)

Multi-instances (Page 706)

Single instances (Page 704)

Call hierarchy (Page 703)

Single instances

Definition

The call of a function block, which is assigned its own instance data block, is called a single instance data block.

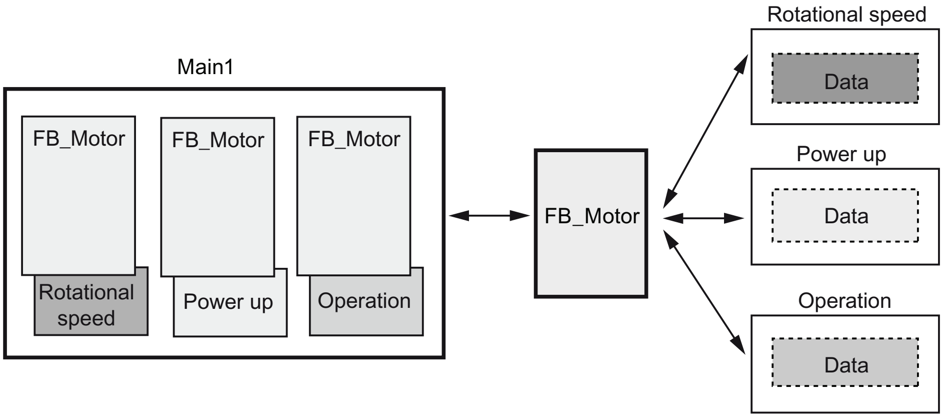
By assignment of the instance data block, you specify where the instance data of the FB is to be stored. By assigning a different instance data block to each call, you can use the same FBs several times with different instance data in each case.

Example of a single instance

You can control several motors using one function block. For this purpose, you assign a different instance data block for each function block call for motor control.

The different data for the various motors, such as speed, ramp-up time, total operating time, are saved in the different instance data blocks. A different motor will be controlled, depending on the instance data block assigned.

The following figure shows the control of three motors using one function block and three different data blocks:



See also

Principles for single instances and multi-instances (Page 704)

Multi-instances (Page 706)

Multi-instances

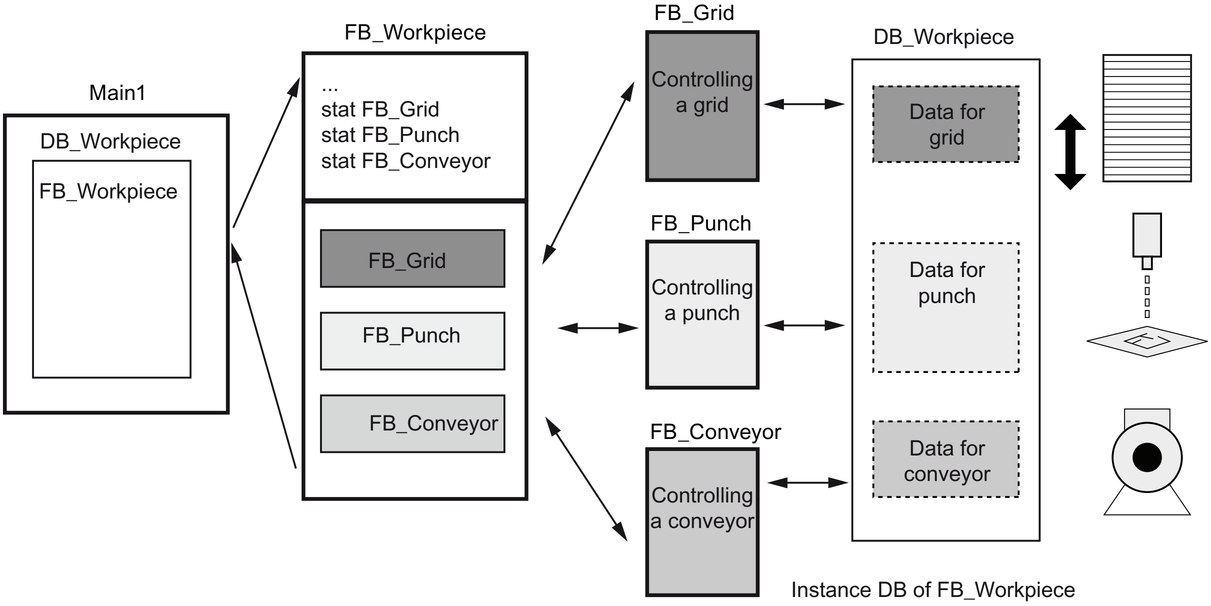
Definition

Multi-instances enable a called function block to store its data in the instance data block of the calling function block.

This allows you to concentrate the instance data in one instance data block and thus make better use of the number of instance data blocks available.

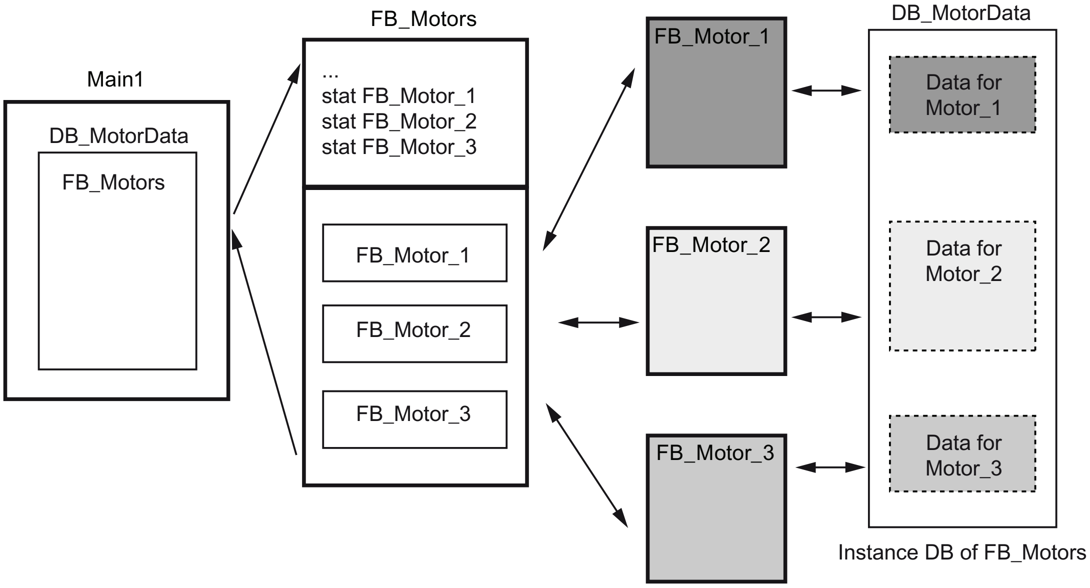
One instance data block for the instances of different function blocks

The following figure shows how multiple different function blocks store their data in a calling block. The FB_Workpiece calls the following on after the other: FB_Grid, FB_Punch and FB_Conveyor. The called blocks store their data in the DB_Workpiece, the instance data block of the calling block.



One instance data block for multi-instances of a function block

The following figure shows how a function block that is called in multi-instances stores the data for all the instances in one instance data block.



The function block FB_Motors calls three instances of the FB_Motor. The instances are "Motor_1", "Motor_2" and "Motor_3". Each call uses different instance data. However, all instance data are located in a single instance data block, DB_MotorData.

See also

Principles for single instances and multi-instances (Page 704)

Single instances (Page 704)

Parameter transfer at block call

Block parameters

Introduction

The calling block gives the called block the values with which it is to work. These values are referred to as block parameters. The input parameters provide the called block with the values that it has to process. The block returns the results via the output parameters.

Block parameters are therefore the interface between the calling and the call block.

You use input parameters when you want to only query or read values, and output parameters when you want to set or write these values. If block parameters are read and written you have to create these as in-out parameters.

Formal and actual parameters

The block parameters are defined in the interface of the called block. These parameters are referred to as formal parameters. They are placeholders for the parameters that are transferred to the block when it is called. The parameters transferred to the block when it is called are referred to as actual parameters.

See also

Parameter assignment to function blocks (Page 710)

Parameter assignment to functions (Page 709)

General rules for assigning parameters (Page 708)

General rules for assigning parameters

Rules for supplying block parameters with values

When you call a block with block parameters, assign actual parameters to its formal parameters. The following rules apply:

- Either a variable or a constant can be specified as an actual parameter.
- The actual parameter must be of the same data type as the formal parameter.
  - You can transfer structures as parameters. If a block has an input parameter of the STRUCT type, you must transfer as actual parameter a STRUCT with identical structure. You can also transfer individual elements of an STRUCT as actual parameter if the element corresponds to the data type of the formal parameter.
  - You can transfer ARRAYs as parameters. If a block has an input parameter of ARRAY type, you must transfer as actual parameter an ARRAY with identical structure. You can also transfer individual elements of an ARRAY as actual parameter if the element corresponds to the data type of the formal parameter.
  - You can transfer variables that have a PLC data type as parameters. If the parameter is declared as the PLC data type in the variable declaration, you must transfer a data type that has the same data element structure. However, an element of a PLC data type can be assigned to a parameter when a block is called, provided that the element of the PLC data type matches the data type of the parameter.

Parameter assignment to function blocks (Page 710)

Parameter assignment to functions (Page 709)

Block parameters (Page 707)

Parameter assignment to functions

Supplying parameters of functions (FC)

Functions have no data memory in which values of block parameters can be stored. Therefore, when a function is called, all formal parameters must be assigned actual parameters.

Function Value

Functions normally calculate a function value. This function value can be returned to the calling block via the RET_VAL output parameter. For this, the RET_VAL output parameter must be declared in the interface of the function. RET_VAL is always the first output parameter of a function. All data types are permitted for the RET_VAL parameter except ARRAY and STRUCT, as well as parameter types TIMER and COUNTER.

In the SCL programming language functions can be call directly in an expression. The result of the expression is then formed with the calculated function value. Therefore, the data type ANY is also not permitted in SCL for the function value.

Parameter assignment to function blocks (Page 710)

Block parameters (Page 707)

General rules for assigning parameters (Page 708)

Calling functions (Page 997)

Examples for calling functions in SCL (Page 999)

Parameter assignment to function blocks

Supplying parameters of function blocks (FB)

In the case of function blocks the parameter values will be stored in the instance data.

If the input, output, or in-out parameters of a function block were not assigned with values, the stored values are used. In some cases, you must assign parameters.

The following table shows which parameters of a function block must be assigned actual parameters:

Parameter	Elementary data type	Structured data type	Parameter type
Input (Input)	optional	optional	required
Output (Output)	optional	optional	required
In-out (InOut)	optional	required	Permitted with S7-1200 only, parameter assignment required

Assigning default values to formal parameters

You can assign default values to formal parameters in the function block interface. These values are transferred to the associated instance data.

If you do not assign actual parameters to the formal parameters in the call instruction, the values currently stored in the instance data block will be used.

The following table shows which variables can be assigned a default value:

Variables	Elementary data type	Structured data type	Parameter type
Input (Input)	optional	optional	not possible
Output (Output)	optional	optional	not possible
In-out (InOut)	optional	not possible	not possible
Static (Static)	optional	optional	not possible
Temporary (Temp)	not possible	not possible	not possible

Forwarding of block parameters

Basic information on forwarding block parameters

Introduction

The "Forwarding" of block parameters is a special type of parameter assignment. In this case the block parameters of the calling block are forwarded to the parameters of the called block. The called block uses the values that are currently present at the block parameters of the calling block as the actual parameters.

The following general rules apply to this:

- Both block parameters must be of the same data type.
- Input parameters can only be forwarded at the input parameter.
- Output parameters can only be forwarded at output parameters.
- In-out parameters can be forwarded at all parameter types.

Detailed rules are described in the following sections.

9.1.1.4 Operands in instructions

Basic information about operands

Introduction

When you program instructions you must specify which data values the instruction should process. These values are referred to as operands. You can, for example, use the following elements as operands:

- PLC variables
- Constants
- Variables in instance data blocks
- Variables in global data blocks

Absolute address and symbolic name

Operands are identified by means of an absolute address and a symbolic name. You define the names and addresses in the PLC variable table or in the variable declaration of the blocks.

Data blocks with optimized access (S7-1200)

Data elements in data blocks with optimized access only receive a symbolic name and no absolute address in the declaration. For more information on this, refer to "See also".

See also

Displaying symbolic and absolute addresses (Page 896)

Basics of block access (Page 700)

Using tags within the program

Definition

A variable is a placeholder for a data value that can be changed in the program. The format of the data value is defined. The use of variables makes your program more flexible. For example, you can assign different values to variables that you have declared in the block interface for each block call. As a result, you can reuse a block you have already programmed for various purposes.

A variable consists of the following elements:

- Name
- Data type
- Absolute address
  - PLC tags and DB tags in blocks with standard access have an absolute address.
  - DB variables in blocks with optimized access have no absolute address.
- Value (optional)

Declaring Variables

You can define variables with different scopes for your program:

- PLC tags that apply in all areas of the CPU
- DB variables in global data block that can be used by all blocks throughout the CPU.
- DB tags in instance data blocks that are predominantly used within the block in which they are declared.

The following table shows the difference between the variable types:

	PLC tags	Variables in instance DBs	Variables in global DBs
Range of application	• Are valid throughout the entire CPU. • Can be used by all blocks on the CPU. • The name is unique within the CPU.	• Are predominantly used in the block in which they are defined. • The name is unique within the instance DB.	• Can be used by all blocks on the CPU. • The name is unique within the global DB.
Permissible characters	• Letters, numbers, special characters • Quotation marks are not permitted. • Reserved keywords are not permitted.	• Letters, numbers, special characters • Reserved keywords are not permitted.	• Letters, numbers, special characters • Reserved keywords are not permitted.

	PLC tags	Variables in instance DBs	Variables in global DBs
Use	• I/O signals (I, IB, IW, ID, Q, QB, QW, QD) • Bit memory (M, MB, MW, MD)	• Block parameters (input, output and in-out parameters), • Static data of a block • Temporary local data of a block	• Static data
Location of definition	PLC tag table	Block interface	Declaration table of the global DB

Constants

Definition

A constant defines an unchangeable data value. Constants can be read by various program elements during the execution of the program but cannot be overwritten. A change of the constant value during the program's execution can lead to syntax or runtime errors.

Symbolic constants (S7-1200)

In S7-1200 you have the option of declaring symbolic names for constants and thus making static values available under a name in the program. The symbolic constants are valid throughout the CPU. Constants are declared in the "Constants" tab of the PLC variable table.

Elements of Constants

A constant consists of the following elements:

- Name (in the case of symbolic constants)

  Valid characters in the constant name are letters, number and special characters; invalid characters are quotation marks and reserved keywords.
- Data type
- Constant value

  The input format and the value range of the constant depend on the data type of the constant.

More information

For more information on data types of constants and their input formats and value ranges, refer to the "Data types" section under "See also".

Rules for symbolic constants (Page 835)

Enter constants (Page 739)

Declaring constants (Page 835)

Reserved key words

SIMATIC recognizes a range of key words whose definitions are fixed and which have a certain meaning in the program. You should not use these keywords as names for tags or constants.

If it necessary to use a keyword as a tag name, enclose it in quotation marks or append an # character in front of it.

Table of reserved key words

The following table shows all the reserved key words.

Keywords German mnemonics	Keywords English mnemonics	Description
A	Q	Output, bit
A1	CC1	Condition code bit
A0	CC0	Condition code bit
AB	QB	Output, byte
AD	QD	Output, double word
ANY	ANY	Designation for ANY data type
AR1	AR1	Address Register 1
AR2	AR2	Address Register 2

Keywords German mnemonics	Keywords English mnemonics	Description
ARRAY	ARRAY	Introduces the specification of an array and is followed by the index list between "[" and "]"
AUTHOR	AUTHOR	Name of the author, company name, department name, or other name (max. 8 characters, no spaces)
AW	QW	Output, word
AX	QX	Output, bit
B	B	Byte
BEGIN	BEGIN	Introduces the instruction part for logic blocks or initialization part for a data block
BIE	BR	Binary result
BOOL	BOOL	Elementary data type for binary data
BY	BY	Increment of the FOR loop
BYTE	BYTE	Elementary data type
CALL	CALL	Call
CASE	CASE	Introduction to the CASE statement
CHAR	CHAR	Elementary data type
CODE_VERSION1	CODE_VERSION1	Label, whether an FB is multi-instance capable or not. If you want to declare multi-instances, the FB must not have this characteristic.
CONST	CONST	Start of the constant declaration
CONTINUE	CONTINUE	Instruction to exit a loop in SCL
DATA_BLOCK	DATA_BLOCK	Introduces the data block
DATE	DATE	Elementary data type for date
DATE_AND_TIME	DATE_AND_TIME	Complex data type for date and time of day
DB	DB	Data block
DBB	DBB	Data block, data byte
DBD	DBD	Data block, data double word
DBLG	DBLG	Data block length
DBNO	DBNO	Data block number
DBW	DBW	Data block, data word
DBX	DBX	Data block, data bit
DI	DI	Instance data block
DIB	DIB	Instance data block, data byte
DID	DID	Instance data block, data double word
DILG	DILG	Instance data block length

Keywords German mnemonics	Keywords English mnemonics	Description
DINO	DINO	Instance data block number
DINT	DINT	Elementary data type for whole numbers (integers) double precision
DIW	DIW	Instance data block, data word
DIX	DIX	Instance data block, data bit
DO	DO	Introduction of the instruction part in FOR and WHILE instruction
DT	DT	Elementary data type for date and time
DWORD	DWORD	Elementary data type for double word
E	I	Input (via process image), bit
EB	IB	Input (via process image), byte
ED	ID	Input (via process image), double word
ELSE	ELSE	Alternative branch in IF and CASE statement
ELSIF	ELSIF	Alternative condition of the IF instruction
EN	EN	System operand of the EN/ENO mechanism
ENO	ENO	System operand of the EN/ENO mechanism
END_CASE	END_CASE	End of the CASE statement
END_DATA_BLOCK	END_DATA_BLOCK	Ends the data block
END_FOR	END_FOR	End of the FOR statement
END_FUNCTION	END_FUNCTION	Ends the function
END_FUNCTION_BLOCK	END_FUNCTION_BLOCK	Ends the function block
END_IF	END_IF	End of the IF instruction
END_ORGANIZATION_BLOCK	END_ORGANIZATION_BLOCK	Ends the organization block
END_REPEAT	END_REPEAT	End of the REPEAT statement
END_STRUCT	END_STRUCT	Ends the specification of a structure
END_SYSTEM_FUNCTION	END_SYSTEM_FUNCTION	Ends the system function
END_SYSTEM_FUNCTION_BLOCK	END_SYSTEM_FUNCTION_BLOCK	Ends the system function block
END_TYPE	END_TYPE	Ends the UDT
END_VAR	END_VAR	Ends a declaration block
END_WHILE	END_WHILE	End of the WHILE instruction
EW	IW	Input (via process image), word
EXIT	EXIT	Instruction to exit a loop in SCL

Keywords German mnemonics	Keywords English mnemonics	Description
FALSE	FALSE	Predefined Boolean constant: Logical condition false, value equal to 0
FAMILY	FAMILY	Block family name: for example, closed-loop controller (max. 8 characters, no spaces)
FB	FB	Function block
FC	FC	Function
FOR	FOR	Introduction of the FOR statement
FUNCTION	FUNCTION	Introduces the function
FUNCTION_BLOCK	FUNCTION_BLOCK	Introduces the function block
GOTO	GOTO	Introduction of the GOTO statement
IF	IF	Introduction of the IF instruction
INT	INT	Elementary data type for whole numbers (integers) single precision
KNOW_HOW_PROTECT	KNOW_HOW_PROTECT	Block protection; a block compiled with this option permits no view of the instruction part.
L	L	Local data bit
LB	LB	Local data byte
LD	LD	Local data double word
LW	LW	Local data word
M	M	Memory bit
MB	MB	Memory byte
MD	MD	Memory double word
MOD	MOD	Modulo operator
MW	MW	Memory word
NAME	NAME	Block name (max. 8 characters)
NETWORK	NETWORK	Network
NOT	NOT	Logic inversion
OB	OB	Organization block
OF	OF	Introduction of the data type specification / Introduction of the instruction part of the CASE statement
OR	OR	Or logical operation of logical expressions
ORGANIZATION_BLOCK	ORGANIZATION_BLOCK	Introduces the organization block
OS	OS	Save overflow
OV	OV	Overflow

Keywords German mnemonics	Keywords English mnemonics	Description
PA	PQ	Output (direct peripherals), bit
PAB	PQB	Output (direct peripherals), byte
PAD	PQD	Output (direct peripherals), double word
PAW	PQW	Output (direct peripherals), word
PE	PI	Input (direct peripherals), bit
PEB	PIB	Input (direct peripherals), byte
PED	PID	Input (direct peripherals), double word
PEW	PIW	Input (direct peripherals), word
POINTER	POINTER	Pointer data type, only permitted in parameter declaration in the parameter block
READ_ONLY	READ_ONLY	Write protection for data blocks; their data can be read, but not changed.
REAL	REAL	Elementary data type
REPEAT	REPEAT	Introduction of the REPEAT statement
RET_VAL	RET_VAL	Return value
RETURN	RETURN	RETURN statement in SCL
S5T	S5T	Syntax for S5 data type
S5TIME	S5TIME	Elementary data type for time information, special S5 format
S7_	S7_	Keywords for system attributes
SDB	SDB	System data block
SFB	SFB	System function block
SFC	SFC	System function
STRING	STRING	Data type for character string
STRUCT	STRUCT	Introduces the specification of a structure and is followed by a list of components
STW	STW	Status word
SYSTEM_FUNCTION	SYSTEM_FUNCTION	System function
SYSTEM_FUNCTION_BLOCK	SYSTEM_FUNCTION_BLOCK	System function block
T	T	Time element (timer)
THEN	THEN	Introduction of the instruction part of an IF instruction
TIME	TIME	Elementary data type for time information
TIME_OF_DAY	TIME_OF_DAY	Elementary data type for time of day
TITLE	TITLE	Optional block title or network title

Keywords German mnemonics	Keywords English mnemonics	Description
TO	TO	Definition of the full-scale value of a FOR statement
TOD	TOD	Elementary data type for time of day
TRUE	TRUE	Predefined Boolean constant: Logical condition true, value not equal to 0
TYPE	TYPE	Introduces UDT
UDT	UDT	Global or PLC data type
UNLINKED	UNLINKED	Marking 'non runtime-related'
UNTIL	UNTIL	End of the instruction part of a REPEAT statement
UO	AO	Query after (Q1=1) AND (Q0=1)
VAR	VAR	Introduces a declaration block
VAR_IN_OUT	VAR_IN_OUT	Introduces a declaration block
VAR_INPUT	VAR_INPUT	Introduces a declaration block
VAR_OUTPUT	VAR_OUTPUT	Introduces a declaration block
VAR_TEMP	VAR_TEMP	Introduces a declaration block
VERSION	VERSION	Version number of the block
VOID	VOID	Function has no return value
WHILE	WHILE	Introduction of a WHILE instruction
WORD	WORD	Elementary data type for word
XOR	XOR	Logic operation
Z	C	Counter
$_<any character>	$_	Alignment symbol

Addressing operands

Addressing global variables

Addressing global variables

To address a global PLC variable, you can use the absolute address or the symbolic name.

Addressing global variables in symbolic form

When you use addressing in symbolic form, you enter the variable name from the PLC variable table. The symbolic name of global variables are automatically enclosed in quotation marks.

Addressing global variables in absolute form

When you use addressing in absolute form, you enter the address of the variables from the PLC variable table. The absolute address uses numerical addresses starting with zero for each operand range.

Examples

The following examples show applications of symbolic and absolute addressing:

Addressing	Explanation
Q1.0	Absolute address: Output 1.0
I16.4	Absolute address: Input 16.4
IW4	Absolute address: Input word 4
"Motor"	Symbolic address "Motor"
"Value"	Symbolic address "Value"

See also: Permissible addresses and data types of PLC tags (Page 829)

See also

Displaying symbolic and absolute addresses (Page 896)

Accessing I/O devices (Page 725)

Accessing I/O devices

Description

The process image of the CPU is updated once in a cycle. In time-critical applications, however, it can be that the current state of a digital input or output has to be read or transferred more often than once per cycle. For this purpose you can use a suffix for I/O access identifiers on the operand to directly access the I/O.

If you want to read the input directly from the peripherals, use the peripheral inputs memory area (PI) instead of the process input image (I). The peripherals memory area can be read as a bit, byte, word, or double word.

If you want to write directly to the output, use the peripheral output (PQ) memory area instead of the process output image (Q). The peripheral output memory area can be written as a bit, byte, word, or double word.

To read or write a signal directly from a peripheral input, you can add the suffix for I/O access ":P", to the operand.

⚠ WARNING

Immediate writing to the I/O can lead to hazardous states, for example when writing multiple times to an output in one program cycle.

Syntax

```
<Operand>:P
```

Example

The following example shows applications of I/O access identifiers:

Addressing	**Description**
"Motor"	//Addresses the variable "Motor" in the process input image.
"Motor":P	//Addresses the variable "Motor" in the memory area of the peripheral inputs (PI).
"Switch"	//Addresses the variable "Switch" in the process output image.
"Switch":P	//Addresses the variable "Switch" in the memory area of the peripheral outputs (PQ).

See also

Addressing global variables (Page 724)

Addressing variables in data blocks

Addressing variables in global data blocks

Description

Variables in global data blocks can be addressed in symbolic or absolute form. For symbolic addressing, you use the name of the data block and the name of the variable, separated by a dot. The name of the data block is enclosed in quotation marks.

For absolute addressing, you use the number of the data block and the absolute address of the variables in the data block, separated by a dot.

Note

Variables in blocks with optimized access can only be addressed in symbolic form.

Syntax

```
"<DBname>".VariableName
<DBnummer>.absoluteAddress
```

The following table show the possible absolute addresses of variables in data blocks:

Data type	Absolute address	Example	Description
BOOL	DBn.DBXx.y	DB1.DBX1.0	Data bit 1.0 in DB1
BYTE, CHAR, SINT, USINT	DBn.DBBy	DB1.DBB1	Data bit 1 in DB1
WORD, INT, UINT	DBn. DBWy	DB1.DBW1	Data word 1 in DB1
DWORD, DINT, UDINT, REAL, TIME	DBn.DBDy	DB1.DBD1	Data double word 1 in DB1

Example

The following examples show the addressing of variables in global data blocks:

Addressing	Description
"Motor".Value	Symbolic addressing of the "Value" variable in the "Motor" global data block.
DB1.DBX1.0	Absolute addressing of the "DBX1.0" tags in the "DB1" global data block.

Addressing structured variables (Page 729)

Addressing individual bits of a variable (Page 730)

Basics of indirect addressing (Page 732)

Addressing instance data (Page 728)

Addressing instance data

Description

You can address data elements from the interface of the current block. These variables are stored in the instance data block. It is not possible to address variables from external instance data blocks.

Note

Variables in blocks with optimized access can only be addressed in symbolic form.

To address a variable from the interface of the current block, enter the character # followed by the symbolic variable name.

You can also access the variables of a multi-instance block. Within the multi-instance block, also use the character # followed by the variable name to address the data. You access the data of the multi-instance block from the calling block using "Multi-instanceName.VariableName".

Syntax

Use the following syntax for addressing variables in instance data blocks:

```
#<VariableName>
#<Multi-instanceName.VariableName>
```

Examples

The following examples show the addressing of variables in instance data blocks:

Addressing	Description
#Value	Addressing the "Value" variable in the instance data block.
#On	Addressing the "On" variable within the multi-instance block
#Multi.On	Addressing the "On" variable of the multi-instance block from the calling block

Structures (Page 768)

Addressing data elements of an PLC data type

The syntax `PLCDataTypeName.ElementName` is used to access PLC data types in the program.

See also:

PLC data types (Page 775)

Example:

The following examples show the addressing of structured data type variables:

Addressing	Description
Motor.Value_1x3[2]	Addressing of a one-dimensional array
Motor.Value_2x4[2,4]	Addressing of a two-dimensional array
Motor.Value_4x7[2,4,1,3]	Addressing of a four-dimensional array
Batch_1.Temperature	Addressing of the element "Temperature" in the structure "Batch_1"
Values.Temperature	Addressing of the element "Temperature" in the PLC data type "Values"

See also

Basics of indirect addressing (Page 732)

Addressing individual bits of a variable

Description

You have the option to specifically address areas within declared tags. You can access width areas 1 bit, 8 bit or 16 bit.

Syntax

The following syntax is used for addressing:

```
<Tag>.X<Bit number>
<Tag>.B<Byte number>
<Tag>.W<Word number>
```

The syntax has the following components:

Part	Description
<Tag>	Tag that you access. The tag must be of the "Bit string" data type. In the case of activated IEC check, the access to tags of the "Integer" data type is also possible.
X B W	ID for the access width "Bit (1Bit)" ID for the access width "Byte (8 Bit)" ID for the access width "Word (16 Bit)"
<Bit number>	Bit number within <tag> that is accessed. The number 0 accesses the lowest bit.
<Byte number>	Byte number within <tag> that is accessed. The number 0 accesses the lowest byte.
<Word number>	Word number within <tag> that is accessed. The number 0 accesses the lowest word.

Examples

The following examples show the addressing of individual bits:

Addressing	**Description**

`"Engine".Motor.X0`
`"Engine".Motor.X7`
	`"Motor" is a tag of the BYTE data type in the global data block "Engine".`
	`X0 addresses the first bit, X7 the eighth bit within "Motor".`

`"Engine".Speed.B0`
`"Engine".Speed.B1`
	`"Speed" is a tag of the WORD data type in the global data block "Engine".`
	`B0 addresses the first bit, B1 the second byte within "Speed".`

`"Engine".Fuel.W0`
`"Engine".Fuel.W1`
	`"FUEL" is a tag of the DWORD data type in the global data block "Engine".`
	`W0 addresses the first word, W1 the second word within "Fuel".`

Overlaying tags with AT

Description

To access data areas within a declared tag, you can overlay the declared tags with an additional declaration. This provides you with the option of addressing an already declared tag with a different data type. You can, for example, address the individual bits of a tag of WORD data type with an ARRAY of BOOL.

Rules

The following rules apply to the overlaying of tags:

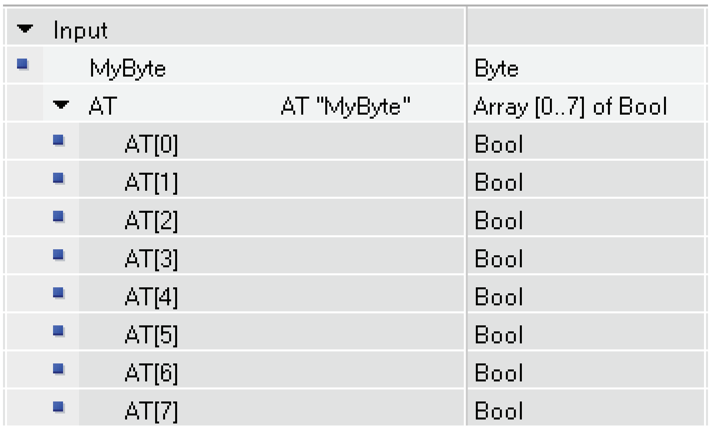
- Overlaying is only possible in S7-1200. The only exception is SCL. In this case overlaying is permitted in all CPU families.
- The overlaying of tags is only possible in the interface of code blocks with standard access.
- Tags from all code block types and all declaration sections (Input, Output, InOut, Static, Temp) can be overlaid.
- An overlaying tag can be used like any other tag in the block.
- It is not possible to overlay tags of data type VARIANT.
- The overlaying tag must be equal to or smaller than the tag that is overlaid.
- The declaration of an overlaying tag must take place immediately after the declaration of the tag to which it is to point and in the same declaration section.

Declaration

To overlay a tag, declare an additional tag directly after the tag that is to be overlaid and identify it with the keyword "AT".

Example

The following figure shows the declaration of an overlaid tag:



▼ Input		
MyByte		Byte
▼ AT	AT "MyByte"	Array [0..7] of Bool
AT[0]		Bool
AT[1]		Bool
AT[2]		Bool
AT[3]		Bool
AT[4]		Bool
AT[5]		Bool
AT[6]		Bool
AT[7]		Bool

When a block is called with the shown tag declaration, the "MyByte" tag is assigned. Within the block there are now two options for interpreting the data:

- as a byte
- As one-dimensional ARRAY of BOOL

Addressing operands indirectly

Basics of indirect addressing

Introduction

In the case of indirect addressing, you calculate the used operands in runtime. With indirect addressing you can also execute program sections several times and use a different operand during each run.

The following general options of indirect addressing are permitted in all programming languages:

- Indirect addressing via pointer
- Indirect indexing of ARRAY components

Additional language-specific options are described in the following sections.

> ⚠ **CAUTION**
>
> Since the operands are only calculated in runtime in the case of indirect addressing, memory areas can be accidentally overwritten. Therefore, use indirect addressing only with caution.

See also

Indirect addressing in SCL (Page 735)

Indirect addressing in STL (Page 737)

Indirect addressing via pointer (Page 733)

Indirect indexing of ARRAY components (Page 734)

Indirect addressing via pointer

Description

For indirect addressing, a special data format is required that contains the address and possibly also the range and the data type of an operand. This data format is referred to as pointer. The following types of pointer are available to you:

- POINTER (S7-300/400)
- ANY (S7-300/400)
- VARIANT (S7-1200)

For more information on the pointer data type, refer to "See also".

Note

In SCL the use of the pointer data type is restricted. The only option available is to forward it to the called block.

Example

The following example shows an indirect addressing with an area-internal pointer:

Addressing in STL	Description
`L P#10.0`	`// Load pointer (P#10.0) in accumulator 1`
`T MD20`	`// Transfer pointer to the operand MD20`
`L MW [MD20]`	`// Load MW10 in accumulator 1`
`....`	`// Any program`
`L MD [MD20]`	`// Load MD10 in accumulator 1`
`....`	`// Any program`
`= M [MD20]`	`// If RLO=1, set the memory bit M10.0`

The pointer P#10.0 is transferred to the operand MD20. If the operand MD20 in square brackets is programmed, this will be replaced in runtime by the address that is contained in the pointer.

See also

Basics of indirect addressing (Page 732)

Indirect indexing of ARRAY components

Description

For addressing the components of an ARRAY, you can enter tags of the integer data type in addition to constants. When using tags the index will be calculated during runtime. You can, for example, use a different index for each cycle in program loops.

Syntax

The following syntax is used for the indirect indexing of a ARRAY:

```
"<Data block>".<ARRAY>["i"] // one-dimensional ARRAY
"<Data block>".<ARRAY>["i"] // one-dimensional ARRAY of STRUCT
"<Data block>".<ARRAY>["i"] // multidimensional ARRAY
"<Data block>".<ARRAY>["i"] // multidimensional ARRAY of STRUCT
```

The syntax has the following components:

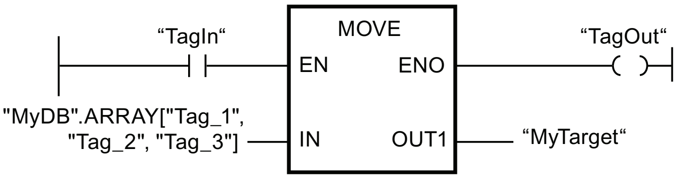
Part	Description
Data block	Name of the data block in which the ARRAY is located
ARRAY	Tag of the ARRAY data type
i, j	PLC tags of the integer data type that are used as pointers
a	Additional partial tag of the structure

Examples

The following examples show the indirect indexing of an ARRAY component using SCL as an example. MOTOR is a one-dimensional ARRAY_of_INT with three rows. VALUES is a PLC tag of the "Integer" data type.

Addressing in SCL	**Description**
`MOTOR[2] := VALUES;`	`(* direct addressing: Assignment of VALUES to the second row of the ARRAY MOTOR*)`
`MOTOR["Tag_1"] := VALUES;`	`(* Indirect addressing: Assignment of VALUES to the row specified by "Tag_1" of the ARRAY MOTOR*)`

The following example shows the indirect indexing of an ARRAY component as an example of LAD. ARRAY is a three-dimensional ARRAY. "Tag_1", "Tag_2" and "Tag_3" are PLC tags of the "Integer" data type. Depending on their values, one of the ARRAY components will be copied to the "MyTarget" tag.



More information

For more information on the ARRAY data type, refer to "See also".

Basics of indirect addressing (Page 732)

Addressing structured variables (Page 729)

Indirect addressing in SCL

With SCL, you have the option of indirectly addressing the following objects:

- Global tags
- Tags in data blocks
- Data blocks

Indirect addressing of tags

Indirect addressing is performed similarly to absolute addressing. An offset in round brackets is specified instead of the address. The offset consists of one byte tag, in the case of operands of one byte and one bit tag. Byte and bit tags must be of data type INT.

Timers and counters from the PLC tag table cannot be addressed indirectly in this way.

Indirect addressing of data blocks

In addition to indexed access to DB tags, there is the option of using the conversion function WORD_TO_BLOCK_DB to address data block indirectly. The DB number is therefore specified as the tag or expression with WORD data type.

Syntax

The following syntax is used for the indirect indexing of data operands in SCL:

- Addressing of a global tag:

  Operand ID (Byte tag)

  Operand ID (Byte tag.Bit tag)
- Addressing of a DB tag:

  MyDB(Byte tag)

  MyDB(Byte tag.Bit tag)
- Addressing a data block

  WORD_TO_BLOCK_DB(Index).Operand ID (Address)

Examples

The following examples show indirect addressing with SCL:

Addressing in SCL

```
(*Depending on the value of the runtime tag i, an input word will be set to 0.*)

#i:=2
FOR #i := 2 TO 8 DO
 EW(#i) := 0  ;
END_FOR;
```

Addressing in SCL

```
 (*Depending on the value of the runtime tag i, a word in MyDB will be set to 0.*)

#i:=2
FOR #i := 2 TO 8 DO
 MyDB.DW(#i) := 0  ;
END_FOR;
```

Addressing in SCL

```
 (*indirect addressing using the WORD_TO_BLOCK_DB conversion function: Global tag
"Address index" of WORD data type is used as the number of the DB. *)

M0.0:=WORD_TO_BLOCK_DB("Adressindex").DX(0.0);
MW0:=WORD_TO_BLOCK_DB("Adressindex").DW(4);
```

Addressing in SCL
`(*indirect addressing using the WORD_TO_BLOCK_DB conversion function: Global tag "Address index" of WORD data type is used as the number of the DB. The data element within the DB is also specified via an index*)`

`M0.0:=WORD_TO_BLOCK_DB("Adressindex").DX(#i.#y);`
`MW0:=WORD_TO_BLOCK_DB("Adressindex").DW(#y);`

Indirect addressing in STL

Basic information about address registers

Introduction

Two address registers are available for the indirect addressing of operands: address register 1 (AR1), and address register 2 (AR2). The address registers are equal and are 32 bits in length. You can store area-internal and cross-area pointers in the address registers. To define the address of an operand, you can call the stored data in the program.

Data is exchanged between the registers and the other available memory areas with the assistance of load and transfer instructions.

For more information on the statements that address registers use and on indirect addressing, refer to "See also".

See also

Indirect addressing in STL (Page 737)

Indirect addressing in STL

In STL, the following options are available for indirect addressing:

- Memory-indirect addressing
- Register-indirect area-internal addressing
- Register-indirect cross-area addressing

Memory-indirect addressing

In the case of memory-indirect addressing, you store the address in a PLC variable. Double words from the operand ranges Data (DBD and DID), bit memory (MD) and local data (LD) are available for storing the address.

The following example shows applications of memory-indirect addressing:

Addressing in STL	Description
U E [MD 2]	// Execute an AND logic operation with the input bit. The address is located in the memory double word MD2.
= DIX [DBD 2]	// Assign the signal state of the RLO bit to the instance data bit. The address is located in the data double word DBD.
L EB [DID 4]	// Load the input byte in ACCU 1. The address is located in the instance double word DID4.
AUF DB [LW 2]	// Open the data block. The number of the data block is located in the local data word LW2.

Register indirect area-internal addressing

Register indirect addressing uses an address register to pick up the address of the operand. With register-indirect area-internal addressing, you program in the instruction an operand range for which the address in the address register is to apply. The address in the address register then moves in the operand range that is specified in the instruction.

The following example shows an application of register-indirect area-internal addressing:

STL	Description
LAR1 P#10.0	// Load pointer (P#10.0) in address register 1
L EW [AR1, P#2.0]	// Add content of address register 1 (P#10.0) to pointer P#2.0
	// Load content of input word IW12 into accumulator 1

Register indirect cross-area addressing

With register-indirect cross-area addressing, you program only the operand width in the instruction. The operand range and the address of the operand are indexed via the address register and can be changed in dynamic form.

The following example shows an application of register-indirect cross-area addressing:

```
LAR1 P#M10.0           // Load pointer (P#M10.0) in address register 1
L W [AR1, P#2.0]       // Add content of address register 1 (P#M10.0) to pointer
                       P#2.0
                       // Load content of memory word "MW12" into accumulator 1
LAR1 P#A10.0           // Load pointer (P#A10.0) in address register 1
L W [AR1, P#2.0]       // Add content of address register 1 (P#A10.0) to pointer
                       P#2.0
                       // Load content of output word QW12.0 into accumulator 1
```

Enter constants

Description

You have the following options for using constants in the program:

- Enter the value
- Input of a symbolic name defined in the PLC tag table (with S7-1200). The symbolic name of a constant will be automatically included in quotation marks.

Both types of constant are displayed in blue in the program.

Syntax

- Enter a value:

  <Value>
- Input of a symbolic constant name from the PLC tag table:

  "<Name>"

Example

The following examples show the use of constants:

Addressing	Description
4	Value entry for a constant of Integer type
FALSE	Value entry for a constant of Bool type
"Name"	Symbolic constants from the PLC variable table
"Offset"	Symbolic constants from the PLC variable table

More information

For more information on data types of constants and their input formats and value ranges, refer to the "Data types" section under "See also".

9.1.1.5 Data types

Overview of the valid data types

Validity of data type groups

The data type groups define the properties of the data, for example, the representation of the content and the valid memory areas. In the user program, you can use predefined data type or also data types that you have defined.

The following tables show the availability of predefined data types in the various S7-CPUs:

Table 9- 1 Binary numbers

Binary numbers	S7-300/400	S7-1200

Note

Depending on the CPU version, the actually valid data types can deviate slightly from the table.

Binary numbers

BOOL (bit)

Description

An operand of the data type BOOL represents a bit value and can contain one of the following values:

- TRUE
- FALSE

The following table shows the properties of the data type BOOL:

Length (bits)	Format	Value range	Examples of value input
1	Boolean	FALSE or TRUE	TRUE
	Binary numbers	0 or 1	1
	Octal numbers	8#0 or 8#1	8#1
	Hexadecimal numbers	16#0 or 16#1	16#1

See also

Overview of the valid data types (Page 741)

Bit strings

BYTE (byte)

Description

An operand of the data type BYTE is a bit string of 8 bits.

The following table shows the properties of the data type BYTE:

Length (bits)	Format	Value range	Examples of value input
8	Unsigned integers	0 to 255	15
	Binary numbers	2#0 to 2#11111111	2#00001111
	Octal numbers	8#0 to 8#377	8#17
	Hexadecimal numbers	B#16#0 to B#16#FF	B#16#F, 16#F

Integers

SINT (8-bit integers)

Description

An operand of the data type SINT has a length of 8 bits and consists of two components: One sign and one numerical value in the two's complement. The signal stats of the bits 0 to 6 stand for the value of the number. The signal state of bit 7 represents the sign. The sign assume "0" for positive or "1" for negative.

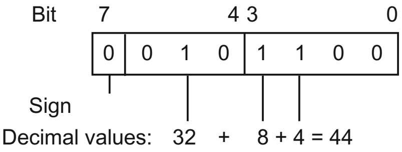
An operand of the data type SINT occupies one byte in the memory.

The following table shows the properties of the data type SINT:

Length (bits)	Format	Value range	Examples of value input
8	Signed integers	-128 to 127	+50
	Binary numbers (only positive)	2#0 to 01111111	2#01010000
	Octal numbers (only positive)	8#0 to 8#177	8#120
	Hexadecimal numbers (only positive)	16#0 to 16#7F	16#50

Example

The following figure shows the integer +44 as a binary number:



See also

Overview of the valid data types (Page 741)

Implicit conversion of SINT (Page 787)

Explicit conversion of SINT (Page 803)

USINT (8-bit integers)

Description

An operand of the data type USINT (unsigned short INT) has a length of 8 bits and can contain unsigned numerical values.

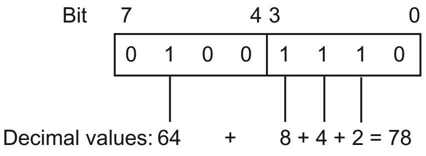
An operand of the data type USINT occupies one byte in the memory.

The following table shows the properties of the data type USINT:

Length (bits)	Format	Value range	Examples of value input
8	Unsigned integers	0 to 255	78
	Binary numbers	2#0 to 2#11111111	2#01001110
	Octal numbers	8#0 to 8#377	8#116
	Hexadecimal numbers	16#0 to 16#FF	16#4E

Example

The following figure shows the integer 78 as a binary number:



See also

Explicit conversion of USINT (Page 804)

INT (16-bit integers)

Description

An operand of the data type INT has a length of 16 bits and consists of two components: One sign and one numerical value in the two's complement. The signal stats of the bits 0 to 14 stand for the value of the number. The signal state of bit 15 represents the sign. The sign assume the value "0" (positive) or "1" (negative).

An operand of the data type INT occupies two bytes in the memory.

The following table shows the properties of the data type INT:

Length (bits)	Format	Value range	Examples of value input
16	Signed integers	- 32768 to 32767	+44
	Binary numbers (only positive)	2#0 to 2#0111111111111111	2#0000000000101100
	Octal numbers (only positive)	8#0 to 8#77777	8#54
	Hexadecimal numbers (only positive)	16#0 to 16#7FFF	16#2C

Example

The following figure shows the integer +44 as a binary number:

Explicit conversion of INT (Page 805)

UINT (16-bit integers)

Description

An operand of the data type UINT (unsigned INT) has a length of 16 bits and can contain unsigned numerical values.

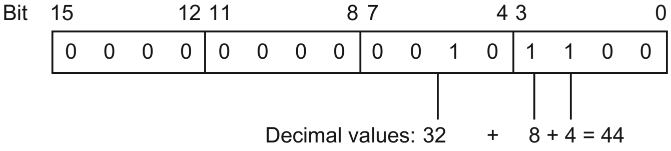
An operand of the data type UINT occupies two bytes in the memory.

The following table shows the properties of a UINT variable:

Length (bits)	Format	Value range	Examples of value input
16	Unsigned integers	0 to 65535	65295
	Binary numbers	2#0 to 2#1111111111111111	2#1111111100001111
	Octal numbers	8#0 to 8#177777	8#177417
	Hexadecimal numbers	16#0 to 16#FFFF	16# FF0F

Example

The following figure shows the integer 44 as a binary number:



See also

Overview of the valid data types (Page 741)

Implicit conversion of UINT (Page 790)

Explicit conversion of UINT (Page 807)

DINT (32-bit integers)

Description

An operand of the data type DINT has a length of 32 bits and consists of two components: One sign and one numerical value in the two's complement. The signal stats of the bits 0 to 30 stand for the value of the number. The signal state of bit 31 represents the sign. The sign assume the value "0" (positive) or "1" (negative).

An operand of the data type DINT occupies four bytes in the memory.

The following table shows the properties of the data type DINT:

Length (bits)	Format	Value range	Examples of value input
32	Signed integers	- 2 147 483 648 to + 2 147 483 647	2131754992
	Binary numbers (only positive)	2#0 to 2#0111111111111111111111 1111111111	2#0111111110000111111111 1110000
	Octal numbers (only positive)	8#0 to 8#17777777777	8#17703777760
	Hexadecimal numbers (only positive)	16#0 to 16#7FFF FFFF	16#7F0FFFF0

Floating-point numbers

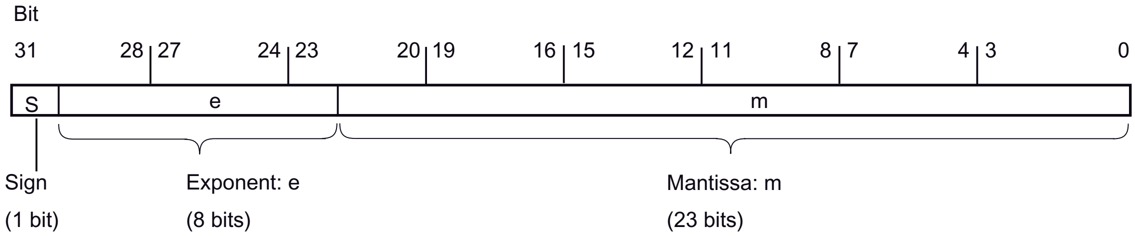
REAL

Description

Operands of the data type REAL have a length of 32 bits and are used to display floating-point numbers. An operand of the REAL data type consists of the following three components:

- Sign: The sign is determined by the signal state of bit 31. The bit 31 assume the value "0" (positive) or "1" (negative).
- 8-bit exponents to basis 2: The exponent is increased by a constant (base, +127), so that it has a value range of 0 to 255.
- 23-bit mantissa: Only the fraction part of the mantissa is shown. The integer part of the mantissa is always 1 with normalized floating-point numbers and is not stored.

The following figure shows the structure of the REAL data type:



The following table shows the properties of the REAL data type:

Length (bits)	Format	Value range	Examples of value input
32	Floating-point numbers to IEEE 754 standard	-3.402823e+38 to -1.175 495e-38 ±0 +1.175 495e-38 to +3.402823e+38	1.0e-5
	Floating-point numbers		1.0

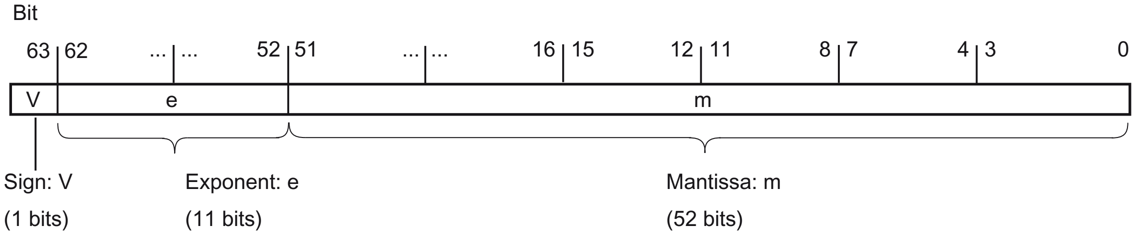
LREAL

Description

Operands of the LREAL data type have a length of 64 bits and are used to represent floating-point numbers. An operand of the LREAL data type consists of the following three components:

- Sign: The sign is determined by the signal state of bit 63. The bit 63 assumes the value "0" (positive) or "1" (negative).
- 11-bit exponents to base 2: The exponent is increased by a constant (base, +1023), so that it has a value range of 0 to 2047.
- 52-bit mantissa: Only the fraction part of the mantissa is shown. The integer part of the mantissa is always 1 with normalized floating-point numbers and is not stored.

The following figure shows the structure of the LREAL data type:



The following table shows the properties of the LREAL data type:

Length (bits)	Format	Value range	Examples of value input
64	Floating-point numbers to IEEE 754 standard	-1.7976931348623158e+308 to -2.2250738585072014e-308 ±0 +2.2250738585072014e-308 to +1.7976931348623158e+308	1.0e-5
	Floating-point numbers		1.0

Overview of the valid data types (Page 741)

Explicit conversion of LREAL (Page 812)

Timers

TIME (IEC time)

Description

The contents of an operand of the data type TIME is interpreted as milliseconds. The representation contains information for days (d), hours (h), minutes (m), seconds (s) and milliseconds (ms).

The following table shows the properties of the data type TIME:

Length (bits)	Format	Value range	Examples of value input
32	Time period with sign:	T#-24d20h31m23s648ms to T#+24d20h31m23s647ms	T#10d20h30m20s630ms, TIME#10d20h30m20s630ms, 10d20h30m20s630ms

It is not necessary to specify all time units. So for instance T#5h10s is valid. If only one unit is specified, the absolute value of days, hours, and minutes must not exceed the high or low limits. When more than one time unit is specified, the value of the unit must not exceed 23 hours 59 minutes 59 seconds 999 milliseconds.

See also

Overview of the valid data types (Page 741)

Implicit conversion of TIME (Page 794)

Explicit conversion of TIME (Page 813)

S5TIME (duration)

Format

The S5TIME data type saves the duration in BCD format. The duration is the product from a time in the range 0 to 999 and a time basis. The time basis indicates the interval at which a timer decrements the time value by one unit until it reaches "0". The resolution of the times can be controlled via the time basis.

The following table shows the value range for the S5TIME data type:

Length (bits)	Format	Value range	Examples of value input
16	S7 time in increments of 10 ms (default value)	S5T#0H_0M_0S_0MS to S5T#2H_46M_30S_0MS	S5T#10s

The following table shows the time basis coding for S5TIME:

Time basis	Binary code for time basis
10 ms	00
100 ms	01
1 s	10
10 s	11

When you use the S5TIME data type with timers, you must observe limit values for the range and the resolution of time values. The table below specifies the range associated with each resolution:

Resolution	Range
0.01 s	10 ms to 9 s 990 ms
0.1 s	100 ms to 1 m 39 s 900 ms
1 s	1 s to 16 m 39 s
10 s	10 s to 2 h 46 m 30 s

Values that exceed 2h46m30s are not accepted.

Example

The following figure shows the content of the time operands for a time value of 127 and a time basis of 1 s:

Overview of the valid data types (Page 741)

Date and time

DATE

Format

The DATE data type saves the date as an unsigned integer. The representation contains the year, the month, and the day.

The contents of an operand of DATE data type corresponds in hexadecimal format to the number of day since 01-01-1990 (16#0000).

The following table shows the properties of the DATE data type:

Length (bytes)	Format	Value range	Examples of value input

2	IEC date
	(Year-Month-Day)
		D#1990-1-1 to
		D#2168-12-31
			D#2009-12-31;
			DATE#2009-12-31;
			2009-12-31

	Hexadecimal numbers	W#16#0000 to W16#FF62	W#16#00F2

See also

Overview of the valid data types (Page 741)

Implicit conversion of DATE (Page 796)

Explicit conversion of DATE (Page 814)

TIME_OF_DAY (TOD)

Format

The data type TOD (TIME_OF_DAY) occupies a double word and saves the number of milliseconds since the beginning of the day (midnight) as a signless integer.

The following table shows the properties of the data type TOD:

Length (bytes)	Format	Value range	Examples of value input
4	Time-of-day (hours:minutes:seconds)	TOD#00:00:00.000 to TOD#23:59:59.999	TOD#10:20:30.400, TIME_OF_DAY#10:20:30.400
	Hexadecimal numbers	DW#16#00000000 to DW#16#05265BFF	DW16##000000F2

The specification of hours, minutes and seconds is required. The specification of milliseconds is optional.

See also

Overview of the valid data types (Page 741)

Implicit conversion of TOD (Page 795)

Explicit conversion of TOD (Page 814)

DATE_AND_TIME (date and time of day)

Format

The DT (DATE_AND_TIME) data type saves the information on date and time of day in BCD format.

The following table shows the properties of the data type DT:

Length (bytes)	Format	Value range	Example of value input
8	Date and time (Year-Month-Day-Hour:Minute:Second)	Min.: DT#1990-1-1-0:0:0 Max.: DT#2089-12-31-23:59:59.999	DT#2008-10-25-8:12:34 DATE_AND_TIME#2008-10-25-8:12:34.567

The following table shows the structure of the DT data type:

Byte	Contents	Value range
0	Year	0 to 99 (Years 1990 to 2089) BCD#90 = 1990 ... BCD#0 = 2000 ... BCD#89 = 2089
1	Month	BCD#0 to BCD#12
2	Day	BCD#1 to BCD# 31
3	Hour	BCD#0 to BCD#23
4	Minute	BCD#0 to BCD#59
5	Second[3)]	BCD#0 to BCD#59
6	The two most significant digits of MSEC	BCD#0 to BCD#999
7 (4MSB) [1)]	The least significant digit of MSEC	BCD#0 to BCD#9
7 (4LSB) [2)]	Weekday	BCD#1 to BCD#7 BCD#1 = Sunday ... BCD#7 = Saturday
[1)] MSB: Most significant bit [2)] LSB: Least significant bit [3)] Fixed point number

Overview of the valid data types (Page 741)

DTL

Description

An operand of the DTL data type has a length of 12 bytes and saves information on date and time in a predefined structure.

The following table shows the properties of the DTL data type:

Length (bytes)	Format	Value range	Example of value input
12	Date and time (Year-Month-Day:Hour:Minute:Second.Nanoseconds)	Min.: DTL#1970-01-01-00:00:00.0 Max.: DTL#2553-12-31-23:59:59.999999999	DTL#2008-12-16-20:30:20.250

The structure of the DTL data type consists of several components each of which can contain a different data type and range of values. The data type of a specified value must match the data type of the corresponding components.

The following table shows the structure components of a DTL data type and its properties:

Byte	Component	Data type	Value range
0	Year	UINT	1970 to 2553
1			
2	Month	USINT	1 to 12
3	Day	USINT	1 to 31
4	Weekday	USINT	1(Sunday) to 7(Saturday) The weekday is not considered in the value entry.
5	Hour	USINT	0 to 23
6	Minute	USINT	0 to 59
7	Second	USINT	0 to 59
8	Nanoseconds	UDINT	0 to 999999999
9			
10			
11

Overview of the valid data types (Page 741)

Explicit conversion of DTL (Page 815)

Character strings

CHAR (character)

Description

An operand of CHAR data type has a length of 8 bits and occupies one byte in the memory.

The CHAR data type stores a single character in ASCII format. You can find information on the coding of special characters at "STRING (Page 763)"

The following table shows the value range of the CHAR data type:

Length (bits)	Format	Value range	Example of value input
8	ASCII characters	ASCII character set	’A’

See also

Overview of the valid data types (Page 741)

Implicit conversion of CHAR (Page 797)

Explicit conversion of CHAR (Page 816)

STRING

Description

An operand of the STRING data type saves several characters in a character string that can consist of up to 254 characters. In a character string, all characters of the ASCII code are permitted. The characters are specified in single quotation marks.

The following table shows the properties of a STRING tag:

Length (bytes)	Format	Value range	Example of value input
n + 2 *	ASCII character string incl. special characters	0 to 254 characters	'Name'
* An operand of the STRING data type occupies two bytes more than the specified maximum length in the memory.			

A character string can also contain special characters. The alignment symbol $ is used to identify control characters, dollar character and single quotation marks.

The following table shows examples for the notation of special characters:

Character	Hex	Meaning	Example
$L or $l	0A	Line feed	'$LText', '$0AText'
$N or $n	0A and 0D	Line break The line break occupies 2 characters in the character string.	'$NText', '$0A$0DText'
$P or $p	0C	Page feed	'$PText', '$0CText'
$R or $r	0D	Carriage return (CR)	'$RText','$0DText'
$T or $t	09	Tabulator	'$TText', '$09Text'
$$	24	Dollar character	'100$$t', '100$26'
$'	27	Single quotation marks	'$'Text$'','$27Text$27'

The maximum length of the character string can be specified during the declaration of an operand using square brackets after the keyword STRING (for example, STRING[4]). If the information on maximum length is omitted, the standard length of 254 characters is set for the respective operand.

If the actual length of a specified character string is shorter than the declared maximum length, the remaining character spaces remain undefined. Only occupied character spaces are considered in the value processing.

Note

For S7-300/400 CPUs, please note: If a temporary tag of the STRING data type was defined, you must describe the BYTE "Max. length of string" with the defined length before you use the tags in the user program.

Example

The example below shows the byte sequence if the STRING[4] data type is specified with output value 'AB':

Overview of the valid data types (Page 741)

Explicit conversion of STRING (Page 817)

Array

Format of ARRAY

Description

The ARRAY data type represents a field that consists of a fixed number of components of the same data type. ARRAYs cannot be nested.

The field components are addressed by means of an index. The index limits are defined in square brackets during the declaration of the field after the keyword ARRAY. The low limit value must be smaller than or equal to the high limit value. The index value must be entered directly; tags cannot be entered. A field can contain up to six dimensions, the limits of which are specified in each case separated by a comma.

The following table shows the properties of the ARRAY data type:

Length	Format	Index limits
Number of components * length of the data type	ARRAY [low limit value...high limit value] of <data type>	[-32768..32767] of <data type>

Example

The following example shows how operands of the ARRAY data type can be declared:

Name	Declaration	Comment
Measured value	ARRAY[1..20] of REAL	One-dimensional field with 20 components
Time-of-day	ARRAY[-5..5] of INT	One-dimensional field with 11 components
Character	ARRAY[1..2, 3..4] of CHAR	Two-dimensional field with 4 components

See also

Overview of the valid data types (Page 741)

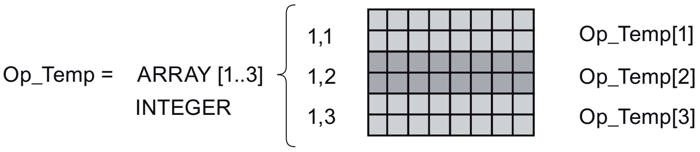
Example of a one-dimensional ARRAY

Declaration

The following table shows the declaration of a one-dimensional ARRAY variable:

Name	Data type	Comment
Op_Temp	ARRAY[1..3] of INT	One-dimensional ARRAY variable with 3 components.

The following figure shows the structure of the declared ARRAY variable:



Access to ARRAY components

The individual array components are accessed via an index.. The index of the first ARRAY component is [1], of the second [2], and of the third [3]. To access the value of the second ARRAY component, the specification "OP_Temp[2]" is required in the program in this case.

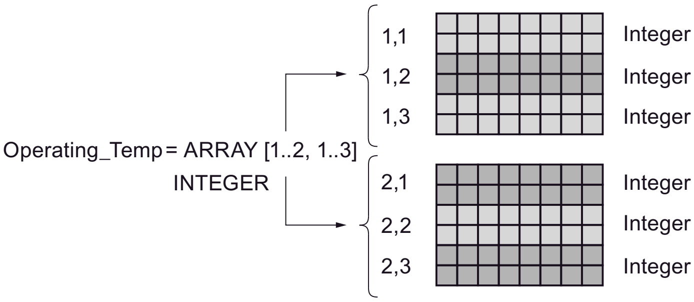
Example of a multi-dimensional ARRAY

Declaration

The following table shows the declaration of a two-dimensional ARRAY variable:

Name	Data type	Value	Comment
Betr_Temp	ARRAY[1..2,1..3] of INT	1,1,4(0)	Two-dimensional ARRAY variable with 6 components. The first two components are assigned the value "1". The remaining four components are assigned the value "0".

The following figure shows the structure of the declared ARRAY variable:



Access to the field components

The values of the individual field components are accessed via an index. The index of the first field component is, for example, [1,1] and the index of the fourth field component is [2,1]. You will, for example, have to enter "Betr_Temp[2,1]" in the program to access the value of the fourth field component.

Alternative access option

You can also declare the "Betr_Temp" variable as six-dimensional field. The following table shows an example of the declaration of a six-dimensional ARRAY variable:

Name	Data type	Value	Comment
Betr_Temp	ARRAY[1..3,1..2,1..3,1..4,1..3,1..4] of INT	-	Six-dimensional ARRAY variable

The index of the first field component is in this case [1,1,1,1,1,1] and the index of the last component is [3,2,3,4,3,4]. Intermediate values are accessed by entering the corresponding value for each dimension.

Structures

STRUCT

Description

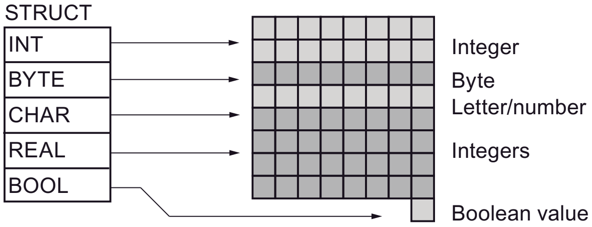
The STRUCT data type defines a structure that consists of components of different data types. Components of STRUCT or ARRAY data type can also be nested in a structure. The nesting depth is hereby limited to eight levels.

The following table shows the properties of the STRUCT data type:

Length	Format	Value range	Example of value input
A STRUCT variable starts with one byte with even address and occupies the memory up to the next word limit.	STRUCT	The value ranges of the used data types apply.	The value input rules of the used data types apply.

Example

The following figure shows an example of the structure of a STRUCT variable:



See also

Overview of the valid data types (Page 741)

Pointer

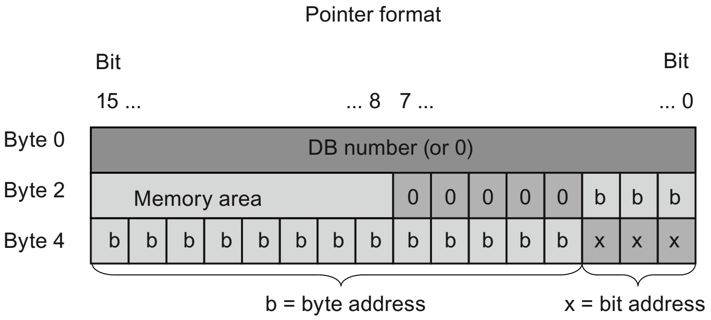
POINTER

Description

A parameter of the POINTER type is a pointer that can point to a specific variable. It occupies 6 bytes (48 bits) in the memory and can contain the following information about a variable.

- DB number, or 0 if the data is not stored in a DB
- Memory area in the CPU
- Variable address

The following figure shows the structure of the POINTER parameter type:



Types of pointer

Depending on the information, you can declare the following three types of pointer with the POINTER parameter type:

- Area-internal pointers:
  Area-internal pointers contain information on the address of a variable.
- Cross-area pointers:
  Cross-area pointers contain information on the memory area and the address of a variable.
- DB pointer:
  You can use a DB pointer to point to a data block variable. A DB pointer also contains a data block number in addition to the memory area and the address of a variable.

The following table shows the formats for the declaration of various pointer types:

Type	Format	Example of value input
Area-internal pointer	P#Byte.Bit	P#20.0
Cross-area pointer	P#OperandAreaByte.Bit	P#M20.0
DB pointer	P#Data_block.Data_operand	P#DB10.DBX20.0

You can enter a parameter of the POINTER type without prefix (P#). You entry is then automatically converted to the pointer format.

Memory areas

The following table shows the hexadecimal codes of the memory areas for the POINTER parameter type:

Hexadecimal code	Memory area	Description
B#16#80	P	I/Os
B#16#81:	E	Memory area of inputs
B#16#82	A	Memory area of outputs
B#16#83	M	Memory area of bit memory
B#16#84	DBX	Data block
B#16#85	DIX	Instance data block
B#16#86	L	Local data
B#16#87	V	Previous local data

Basics of indirect addressing (Page 732)

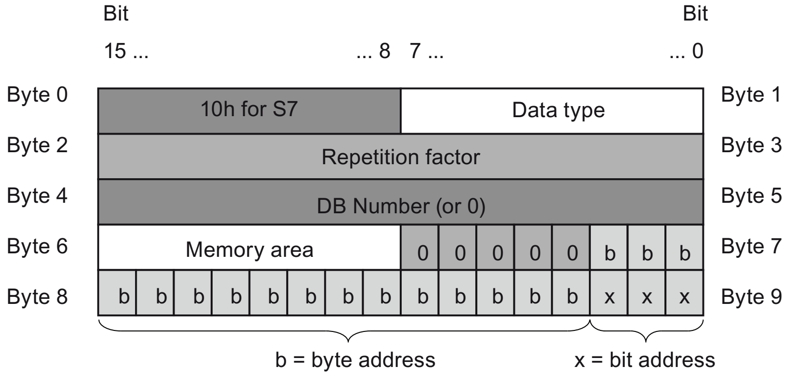
ANY

Description

A parameter of the ANY type is a pointer that points to the start of a data range and states its length. An ANY pointer occupies 10 bytes in the memory and can contain the following information:

- Data type
  Data type of the elements of the data range
- Repeat factor:
  Number of the elements of the data range
- DB number:
  Data block in which the elements of the data range are declared.
- Memory area:
  Memory area of the CPU in which the elements of the data range are stored.
- Start address of data in format "Byte.Bit"
  Start of the data range to which the ANY pointer points.

The following figure shows the structure of the ANY pointer:



An ANY pointer can recognize no structures. It can only be assigned to local variables.

The following table shows the formats for the declaration of an ANY pointer:

Format	Example of value input	Description
P#DataBlock.MemoryArea DataAddress Type Number	P#DB 11.DBX 20.0 INT 10	Area with 10 words in the global DB 11 starting with DBB 20.0
P#MemoryArea DataAddress Type Number	P#M 20.0 BYTE 10	Area with 10 bytes starting with MB 20.0
	P#E 1.0 BOOL 1	Input I 1.0

Coding of data types

The following table shows the coding of the data types for the ANY pointer:

Hexadecimal code	Data type	Description
B#16#00	NIL	Null pointer
B#16#01	BOOL	Bits
B#16#02	BYTE	bytes, 8 bits
B#16#03	CHAR	8-bit characters
B#16#04	WORD	16-bit words
B#16#05	INT	16-bit integers
B#16#37	SINT	8-bit integers
B#16#35	UINT	16-bit unsigned integers
B#16#34	USINT	8-bit unsigned integers
B#16#06	DWORD	32-bit words
B#16#07	DINT	32-bit integers
B#16#36	UDINT	32-bit unsigned integers
B#16#08	REAL	32-bit floating-point numbers
B#16#0B	TIME	Duration
B#16#0C	S5TIME	Duration
B#16#09	DATE	Date
B#16#0A	TOD	Date and time
B#16#0E	DT	Date and time
B#16#13	STRING	Character string
B#16#17	BLOCK_FB	Function block
B#16#18	BLOCK_FC	Function
B#16#19	BLOCK_DB	Data block
B#16#1A	BLOCK_SDB	System data block
B#16#1C	COUNTER	Counter
B#16#1D	TIMER	Time

Coding of the memory area

The following table shows the coding of the memory areas for the ANY pointer:

Hexadecimal code	Area	Description
B#16#80	P	I/Os
B#16#81:	I	Memory area of inputs
B#16#82	O	Memory area of outputs
B#16#83	M	Memory area of bit memory
B#16#84	DBX	Data block
B#16#85	DIX	Instance data block
B#16#86	L	Local data
B#16#87	V	Previous local data

Basics of indirect addressing (Page 732)

VARIANT

Description

A parameter of the VARIANT type is a pointer that can point to variables of various data or parameter types. The VARIANT pointer can recognize structures and point to individual structure components. An operand of the VARIANT data type occupies no space in the memory.

The following table shows the properties of the VARIANT pointer:

Length (bytes)	Representation	Format	Example of value input
0	Symbolic	Operand	MyTag
		NameDataBlock.NameOperand.Component	MyDB.StructVariable.FirstComponent
	Absolute	Operand	%MW10
		DataBlockNumber.Operand Type Length (valid only for blocks with standard access)	P#DB10.DBX10.0 INT 12

See also

Basics of indirect addressing (Page 732)

Parameter types

Parameter types

Description

The parameter types are data types for formal parameters that are transferred to the called block. A parameter type can also be a PLC data type.

The following table shows the available parameter data types and their purpose:

Parameter type	Length (bits)	Description
TIMER	16	Is used to specify a timer that is used in the called logic block. If you assign a formal parameter of the TIMER parameter type, the associated actual parameter must be a timer. Example: T1
COUNTER	16	Is used to specify a counter that is used in the called logic block. If you assign a formal parameter of the COUNTER parameter type, the associated actual parameter must be a counter. Example: C10
BLOCK_FC	16	Is used to specify a block that is used as input in the called logic block. The declaration of the parameter determines the block type (for example FB, FC, DB) that is to be used. If you assign a formal parameter of the BLOCK parameter type, enter a block address as the actual parameter. Example: DB 3
BLOCK_FB	16	
BLOCK_DB	16	
BLOCK_SDB	16	
BLOCK_SFB	16	
BLOCK_SFC	16	
BLOCK_OB	16	
BLOCK_SDT	-	
BLOCK_UDT	-	
VOID	-	The VOID parameter type saves no values. This parameter type is used if the return values of an output are not required. The VOID parameter type, for example, can be specified at the STATUS output if no error information is required.

Overview of the valid data types (Page 741)

Basics of PLC data types (Page 1036)

PLC data types

PLC data types

Description

PLC data types are data structures that you define and that can be used multiple times within the program. The structure of a PLC is made up of several components, each of which can contain different data types. You define the type of components during the declaration of the PLC data type.

PLC data types can be used for the following applications:

- PLC data types can be used as data types for variables in the variable declaration of logic blocks or in data blocks.
- PLC data types can be used as templates for the creation of global data blocks with identical data structures.

See also

Addressing structured variables (Page 729)

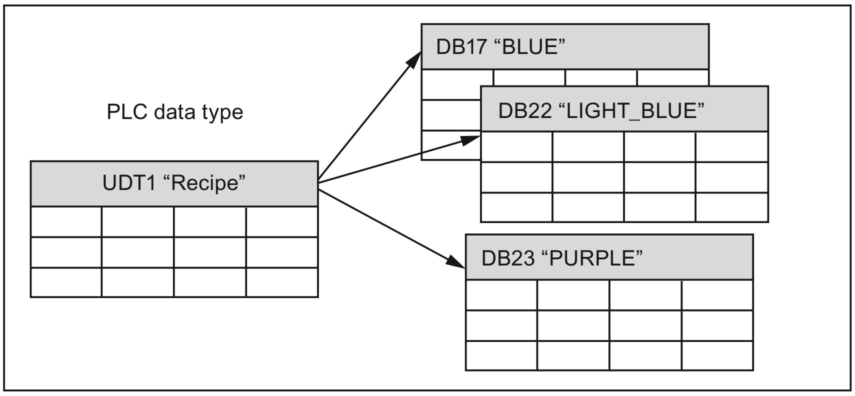
Example of a PLC data type

Example

You can declare PLC data types as the type when creating data blocks. Based on this type you can create a number of data blocks, all of which have the same data structure. These data blocks can be adapted by entering different actual values for the corresponding task.

For instance, create a PLC data type for a recipe for blending paints. You can then assign this data type to several data blocks, each of which contains other quantity information.

The following figure shows this application:



System data types

System data types

Description

The system data types (SDT) are made available by the system and have a predefined structure. The structure of a system data type consists of a fixed number of components that can have various data types. It is not possible to change the structure of a system data type.

The system data types can only be used for specific instructions. The following table shows the available system data types and their purpose:

System data type	Length (bytes)	Description
IEC_TIMER	16	Structure of a timer This data type is used for the "TP", "TOF", "TON" and "TONR" instructions, for example.
IEC_SCOUNTER	3	Structure of a counter whose count values are of SINT data type. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.
IEC_USCOUNTER	3	Structure of a counter whose count values are of USINT data type. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.
IEC_COUNTER	6	Structure of a counter whose count values are of INT data type. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.
IEC_UCOUNTER	6	Structure of a counter whose count values are of UINT data type. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.
IEC_DCOUNTER	12	Structure of a counter whose count values are of DINT data type. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.
IEC_UDCOUNTER	12	Structure of a counter whose count values are of UDINT data type. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.
ERROR_STRUCT	28	Structure of an error information to a programming or I/0 access error. This data type is used, for example, for the "GET_ERROR" instruction.
CREF	8	Components of the ERROR_STRUCT data type, in which information about the address of a block is saved.

System data type	Length (bytes)	Description
NREF	8	Components of the ERROR_STRUCT data type, in which information about the address of an operand is saved.
VREF	12	Is used for storage of a VARIANT pointer. This data type is, for example, used for instructions from S7-1200 Motion Control.
STARTINFO	12	Specifies the data structure in which the start information is saved. This data type is used, for example, for the "RD_SINFO" instruction.
SSL_HEADER	4	Specifies the data structure in which information about the data records are saved during the reading of the system status lists. This data type is used, for example, for the "RDSYSST" instruction.
CONDITIONS	52	User-defined data structure defining the conditions for start and end of a data reception. This data type is used, for example, for the "RCV_CFG" instruction.
TADDR_Param	8	Specifies the structure of a data block which stores descriptions of connections for Open User Communication via UDP. This data type is used for the "TUSEND" and "TURSV" instructions, for example.
TCON_Param	64	Specifies the structure of a data block which stores descriptions of connections for Open User Communication via Industrial Ethernet (PROFINET). This data type is used for the "TSEND" and "TRSV" instructions, for example.

Overview of the valid data types (Page 741)

Hardware data types

Hardware data types

Description

The hardware data types are made available by the CPU. The number of available hardware data types depends on the CPU.

Constants of a specific hardware data type are stored based on the modules set in the hardware configuration. When an instruction for controlling or activating a configured module is inserted in the user program, the available constants can be used for the parameters.

The following table shows the available hardware data types and their purpose:

Data type	Basic data type	Description
REMOTE	ANY	Is used to specify the address of a remote CPU This data type is used for the "PUT" and "GET" instructions, for example.
HW_ANY	WORD	Identification of any hardware component, such as a module
HW_IO	HW_ANY	Identification number of the CPU or the interface The number is automatically allocated and is stored in the properties of the CPU or of the interface in the hardware configuration
HW_SUBMODULE	HW_IO	Identification of a central hardware component
HW_INTERFACE	HW_SUBMODULE	Identification of an interface component
HW_HSC	HW_SUBMODULE	Identification of a fast counter This data type is used, for example, for the "CTRL_HSC" instruction.
HW_PWM	HW_SUBMODULE	Identification of a pulse width modulation This data type is used, for example, for the "CTRL_PWM" instruction.
HW_PTO	HW_SUBMODULE	Identification of a pulse encoder This data type is used for motion control
AOM_IDENT	DWORD	Identification of an object in the runtime system of the AS.
EVENT_ANY	AOM_IDENT	Used to identify any event
EVENT_ATT	EVENT_ANY	Is used to specify an event that can be assigned dynamically to an OB This data type is used for the "ATTACH" and "DETACH" instructions, for example.
EVENT_HWINT	EVENT_ATT	Is used to specify a hardware interrupt event.
OB_ANY	INT	Is used to specify any organization block
OB_DELAY	OB_ANY	Used to specify an organization block that is called when a time-delay interrupt occurs. This data type is used, for example, for the "SRT_DINT" and "CAN_DINT" instructions.

Data type	Basic data type	Description
OB_TOD	OB_ANY	Specifies the number of a time-of-day interrupt organization block This data type is used, for example, for the "SET_TINT", "CAN_TINT", "ACT_TINT" and "QRY_TINT" instructions.
OB_CYCLIC	OB_ANY	Is used to specify an organization block that is called when a watchdog interrupt occurs.
OB_ATT	OB_ANY	Is used to specify an organization block that can be assigned dynamically to an event. This data type is used for the "ATTACH" and "DETACH" instructions, for example.
OB_PCYCLE	OB_ANY	Is used to specify an organization block that can be assigned to an event of the "Cyclic program" event class.
OB_HWINT	OB_ATT	Is used to specify an organization block that is called when a hardware interrupt occurs.
OB_DIAG	OB_ANY	Is used to specify an organization block that is called when a diagnostic interrupt occurs.
OB_TIMEERROR	OB_ANY	Is used to specify an organization block that is called when a time error occurs.
OB_STARTUP	OB_ANY	Is used to specify an organization block that is called when a startup event occurs.
PORT	UINT	Is used to specify a communication port This data type is used for point-to-point communication.
RTM	UINT	Is used to specify the number of an operating hours counter This data type is used, for example, for the "RTM" instruction.
CONN_ANY	WORD	Used to identify any connection
CONN_PRG	CONN_ANY	Is used to specify a connection for open communication via UDP
CONN_OUC	CONN_ANY	Used to identify a connection for open communication via Industrial Ethernet (PROFINET)

Data type conversion

Data type conversion

Overview of data type conversion

Introduction

If you link several operands in an instruction, you must make sure that the data types are compatible. This applies also for assignments or for supplying block parameters. If the operands are not the same data type, a conversion has to be carried out.

There are two options for the conversion:

- Implicit conversion

  The conversion take place automatically when the instruction is executed.

- Explicit conversion

  You use an explicit conversion instruction before the actual instruction is executed.

Implicit conversion

An implicit conversion is executed automatically if the data types of the operands are compatible. This compatibility test can be carried out according to criteria that are more or less strict:

- With IEC check
  If IEC check is set the following rules are applied:
  - The implicit conversion of bit strings into other data types is not possible. An operand of the WORD data type, for example, cannot be specified at a parameter if the INT data type is expected at this parameter.
  - The bit length of the source data type must not exceed the bit length of the destination data type. An operand of the WORD data type, for example, cannot be specified at a parameter if the BYTE data type is expected at this parameter.
- Without IEC check (default setting)
  If IEC check is not set the following rules are applied:
  - The implicit conversion of bit strings into other data types is possible. An operand of the WORD data type, for example, can be specified at a parameter if the INT data type is expected at this parameter.
  - The implicit conversion of bit strings into floating-point numbers is not possible. An operand of the WORD data type, for example, cannot be specified at a parameter if the REAL data type is expected at this parameter.
  - The implicit conversion of bit strings into the TIME, TOD, DATE and CHAR data types is only possible if the bit length is identical. An operand of the WORD data type, for example, cannot be specified at a parameter if the DATE data type is expected at this parameter.
  - The bit length of the source data type must not exceed the bit length of the destination data type. An operand of the DINT data type, for example, cannot be specified at a parameter if the INT data type is expected at this parameter.
  - At in/out parameters, the bit length of a specified operand must match the programmed bit length of the respective parameter.

In the implicit conversion of data types with a smaller bit length to data types with greater bit length (for example, from BYTE to INT) the parameters of the conversion boxes are identified with a gray symbol.

For more information about the setting of the IEC check and the implicit conversion, refer to "See also".

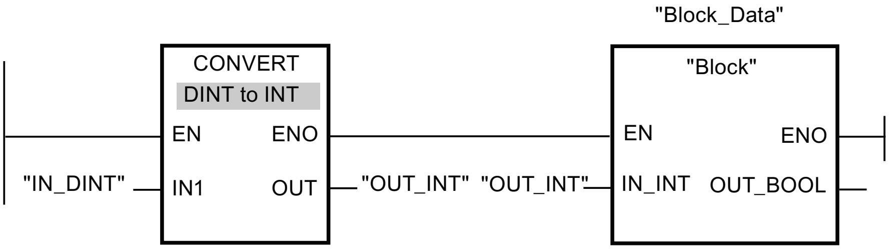
Explicit conversion

If the operands are not compatible and an implicit conversion is therefore not possible, you can use an explicit conversion instruction. You can find the conversion instructions in the "Instructions" task card.

A possible overflow is displayed at the ENO enable output. An overflow is created, for example, if the value of the source data type is greater than the value of the target data type.

For more information about explicit conversion, refer to "See also".

The following figure shows an example in which an explicit data type conversion must be carried out:



The "Block" function block expects a tag of the INT data type at the "IN_INT" input parameter. Therefore, the value of the "IN_DINT" tag must first be converted from DINT to INT. If the value of the "IN_DINT" tag is within the permitted value range of the INT data type, the conversion takes place. Otherwise, an overflow is signaled. A conversion still takes place even in case of an overflow, but the values are cut off and the enable output ENO is set to "0".

Setting and canceling the IEC check (Page 782)

Implicit conversion

Setting and canceling the IEC check

When an instruction is executed, the data types are checked for compatibility to the employed operands. This compatibility test can be carried out according to criteria that are more or less strict. If "IEC Check" is activated, stricter criteria are applied.

You can set the IEC check centrally for all new blocks of the project or for specific blocks.

Setting IEC check for new blocks

To set the IEC check for all new blocks in the project, proceed as follows:

1. Select the "Settings" command in the "Options" menu.

   The "Settings" window is displayed in the work area.

2. Select the "PLC programming > General" group in the area navigation.
3. Select or clear the "IEC Check" check box in the "Default settings for new blocks" group.

   The IEC check is enabled or disabled for all new blocks in the program.

Setting IEC check for a block

To set the IEC check for a block, proceed as follows:

1. Open the block.
2. Open the "Properties" tab in the inspector window.
3. Click the "Attributes" group in area navigation.
4. Select or clear the "IEC Check" check box.

   The IEC check is enabled or disabled for this block. The setting is stored together with the project.

Binary numbers

Implicit conversion of BOOL

Options for the implicit conversion of LAD and FBD

The implicit conversion of the BOOL data type is not possible.

Options for implicit conversion of SCL

The following table shows the options for implicit conversion of the BOOL data type:

Source	Destination	With IEC Check	Without IEC Check	Explanation
BOOL	BYTE	x	x	The bit pattern of the source value is transferred unchanged right-justified to the destination data type.
	WORD	x	x	
	DWORD	x	x	
x: Conversion possible -: Conversion not possible

9.1.1.6 Program flow control

EN/ENO mechanism

Basics of the EN/ENO mechanism

Introduction

Runtime errors that require a program abort can occur during the processing of instructions. You can use the EN/ENO mechanism to avoid such program aborts. This mechanism can be used at two levels:

- EN/ENO mechanism for individual instructions
- EN/ENO mechanism for complete blocks

EN/ENO mechanism for basic instructions

In LAD and FBD, certain instructions have an enable input EN and an enable output ENO.

You can use the enable input EN to make the execution of the instruction dependent on conditions. The instructions are only executed if the signal state is "1" at the enable input EN.

You can use the enable output ENO to query runtime errors in instructions and react to these.

The enable output ENO returns the signal state "1" if one of the following conditions applies:

- No error occurred during processing.

The enable output ENO returns signal state "0" if one of the following conditions applies:

- The EN input has signal state "0".
- An error occurred during processing.

The EN/ENO mechanism is used for the following basic instructions:

- Math functions
- Move operations
- Conversion operations
- Word logic operations
- Shift + rotate

With SCL, the use of the EN/ENO mechanism for instructions is optional. You can activate it with the block property "Set ENO automatically".

In STL, the EN/ENO mechanism is not required for individual instructions. This function is mapped there by language-specific instruction sequences.

EN/ENO mechanism for block calls

When called, all blocks are provided with a enable input EN and an enable output ENO. You can use the enable input EN to call the block depending on conditions. The block is only executed if the signal state is "1" at the enable input EN.

The enable output ENO has signal "1" as soon as the execution of the block starts. If one of the instructions within the block generates a runtime error, ENO is set to "0". You can also use ENO as group error message, for example.

Note

When you call functions in SCL, you cannot use the release mechanism via EN. Use an IF statement instead to call functions conditionally.

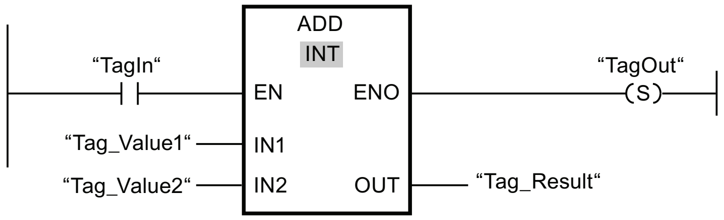
Example of the use of the EN/ENO mechanism in LAD

Description

The following figure shows an ADD instruction with EN and ENO protective circuit:



After the normally open contact, the RLO contains the previous result of logic operation:

- If "TagIn" signal is "0", the addition is not executed. EN and ENO both lead to the signal state "0".
- If "TagIn" signal is "1", EN is also "1" and the addition is executed. If no errors occur during the processing of the instruction, the output ENO also has the signal state "1" and the output ""TagOut"" is set.

See also

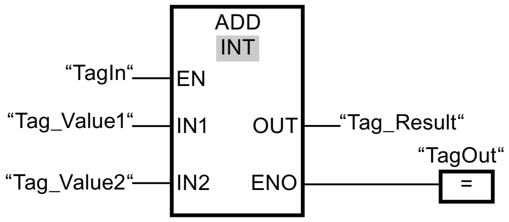
Basics of the EN/ENO mechanism (Page 819)

ADD: Add (Page 1289)

Example of the use of the EN/ENO mechanism in FBD

Description

The following figure shows an ADD instruction with EN and ENO protective circuit:



- If "TagIn" signal is "1", EN is also "1" and the addition is executed. If no errors occur during the processing of the instruction, the output ENO also has the signal state "1" and the output ""TagOut"" is set.
- If "TagIn" signal is "0", the addition is not executed. EN and ENO both lead to the signal state "0".

Example of the use of the EN/ENO mechanism in SCL

Example of the EN/ENO mechanism for basic instructions

To use the EN/ENO mechanism for instructions in SCL, you have to activate the block property "Set ENO automatically". The following example shows the use of the enable output ENO for the "a/b" instruction.

SCL

```
"MyoutputREAL" :=a/b;
IF ENO
 THEN "MyOutputBool":=1;
 ELSE "MyOutputBool":=0;
END_IF;
```

If the "a/b" instruction is executed error-free, MyOutputBool has signal "1".

Example of the use of the EN/ENO mechanism in block calls

The following example shows the use of the enable output ENO for a block call.

SCL

```
"MyDB"."MyFB"(EN:="MyTag1">"MyTag2",
 in1:="MyInputBool1",
 in2:="MyInputBool1",
 EN0=>"MyOutputBool");
```

If MyTag1 is not greater than MyTag2 the block call is not processed. EN and ENO both lead to the signal state "0".

If MyTag1 is greater than MyTag2, EN has signal "1" and the block call is executed.

If all instructions within MyFB are executed error-free, MyOutputBool has signal "1".

See also

Basics of the EN/ENO mechanism (Page 819)

Example of the simulation of the EN/ENO mechanism in STL

Description

The following example shows an program section for adding values with EN and ENO connected:

STL	Description
A"Tag_Input_1"	// Query whether the signal state of the operand is "1" and AND with current RLO
JNBMyLABEL	// Evaluation of the EN input
	// If RLO="0" jump to jump label "MyLABEL" and save the current RLO in the BR
	// Execute next instruction if RLO="1"
L"Tag_Input_2"	// Load first value of addition
L"Tag_Input_3"	// Load second value of addition
+I	// Add values
T "Tag_Result"	// Transfer sum to the operand "Tag_Result"
AN OV	// Query if errors occurred
SAVE	// Transfer signal state of the RLO to the BR bit
CLR	// Reset RLO to "0"
MyLABEL: U BR	// Jump label "MyLABEL"
	// Query BR and AND with RLO
= "Tag_Output"	// Assign signal state of the RLO to the operand "Tag_Output"

The query of the operand "U" Tag_Input_1"" provides the result of the preceding logic operation (RLO). The instruction "Jump at RLO = 0 and save RLO (SPBNB)" saves the RLO to the BR. The instruction "Jump if RLO = 0 and save RL0" also evaluates the RLO and executes one of the following actions depending on the evaluation:

- If the RLO is "0", the processing of the program is continued at the jump label "MyLABEL" with the query of the BR. The addition is not executed. Assign the current RLO to the operand "Tag_Output".
- If the RLO is "1", the addition is executed. A query of the overflow bit (OV) shows if an error occurred during the addition. The query result is saved in the BR. The operation "CLR" resets the RLO to "0". The BR is then queried for "1" and AND'd with the current RLO. The result is assigned to the operand "Tag_Output". The signal state of the BR and of the operand "Tag_Output" shows if the addition was carried out with any error

9.1.2 Declaring PLC tags

9.1.2.1 Overview of PLC tag tables

Introduction

PLC tag tables contain the definitions of the PLC tags and symbolic constants that are valid throughout the CPU. A PLC tag table is created automatically for each CPU used in the project. You can create additional tag tables and use these to sort and group tags and constants.

In the project tree there is a "PLC tags" folder for each CPU of the project. The following tables are included:

- "All tags" table
- Standard tag table
- Optional: Other user-defined tag tables

All tags

The "All tags" table gives an overview of all PLC tags, user constants and system constants of the CPU. This table cannot be deleted or moved.

Standard tag table

There is one standard tag table for each CPU of the project. It cannot be deleted, renamed or moved. The default tag table contains PLC tags, user constants and system constants. You can declare all PLC tags in the default tag table, or create additional user-defined tag tables as you want.

User-defined tag tables

You can create multiple user-defined tag tables for each CPU to group tags according to your requirements. You can rename, gather into groups, or delete user-defined tag tables. User-defined tag tables can contain PLC tags and user constants.

See also

Structure of the PLC tag tables (Page 825)

Using tags within the program (Page 717)

Constants (Page 718)

9.1.2.2 Structure of the PLC tag tables

Introduction

Each PLC tag table contains a tab for tags and a tab for user constants. The default tag table and the "All tags" table also have a "System constants" tab.

Structure of the "PLC tags" tab

In the "Tags" tab you declare the global PLC tags that you require in the program. The following figure shows the tab structure. The number of columns shown may vary.

	Name	Data type	Address	Retain	Visible in HMI	Accessible from HMI	Comment
	Motor1	Bool	%Q3.1	□	☑	☑	
	Motor2	Bool	%Q3.2	□	☑	☑	
	Control	Bool	%I3.3	□	☑	☑	

The following table shows the meaning of the individual columns. The number of columns shown may vary. You can show or hide the columns as required.

Column	Description
	Symbol you can click on to drag-and-drop a tag to a program for use as an operand.
Name	Unique name for the constants throughout the CPU.
Data type	Data type of the tags.
Address	Tag address.
Retain	Marks the tag as retentive. The values of retentive tags are retained even after the power supply is switched off.
Accessible from HMI	Shows whether HMI can access this tag during runtime.
Visible in HMI	Shows whether the tag is visible by default in the operand selection of HMI.
Monitor value	Current data value in the CPU. This column only appears if an online connection is available and you select the "Monitor" button.
Tag table	Shows which tag table includes the tag declaration. This column is only available in the "All tags" table.
Comment	Comments to document the tags.

Structure of the "User constants" and "System constants" tabs

In the "User constants" you define symbolic constants that are valid throughout the CPU. The constants required by the system are shown in the "Systems constants" tab. The following figure shows the structure of both tabs. The number of columns shown may vary.

	Name	Data type	Value	Comment
▤	Const_1	Bool	true	
▤	Const_2	Byte	12	
▤	Const_3	Bool	false	
▤	Const_4	Real	1.0	

The following table shows the meaning of the individual columns. You can show or hide the columns as required.

Column	Description
▤	Symbol you can click to move a tag into a network via a drag-and-drop operation for use as an operand.
Name	Unique name for the constants throughout the CPU.
Data type	Data type of the constants
Value	Value of the constants
Tag table	Shows which tag table includes the constant declaration. This column is only available in the "All tags" table.
Comment	Comments to document the tags.

9.1.2.3 Creating and managing PLC tag tables

Creating a PLC tag table

You can created multiple user-defined PLC tag tables in a CPU. Each tag table must have have a unique name throughout the CPU.

Requirement

The project view is open.

Procedure

To created a new PLC tag table, follow these steps:

1. Open the "PLC tags" folder under the CPU in the project tree.
2. Double-click the "Add new tag table" entry.

   A new PLC tag table with the standard name "TagTable_x" is opened.
3. Select the PLC tag table in the project tree.
4. Select the "Rename" command in the shortcut menu.
5. Type in a name that is unique throughout the CPU.

Result

A new PLC tag table is created. You can now declare tag and constants in this table.

See also

Overview of PLC tag tables (Page 824)

Structure of the PLC tag tables (Page 825)

Importing and exporting (Page 1200)

Grouping PLC tag tables

You can gather the user-defined tag tables of the CPU into groups. You cannot, however, move the standard tag table and the "All tags" table into a group.

Requirement

Multiple user-defined tag tables are contained in the "PLC tags" folder of the CPU.

Procedure

To gather multiple PLC tag tables into a group, follow these steps:

1. Select the "PLC tags" folder under the CPU in the project tree.
2. Select the "Insert > Group" menu command.

   A new group with the standard name "Group_x" is inserted.
3. Select the newly inserted group in the project tree.
4. Select the "Rename" command in the shortcut menu.
5. Assign the new group a unique name throughout the CPU.
6. Drag to the new group the tables you want to group together.

Result

The tag tables are gathered in the new group.

See also

Overview of PLC tag tables (Page 824)

Structure of the PLC tag tables (Page 825)

Opening the PLC tag table

Procedure

To open the PLC tag table in a CPU, proceed as follows:

1. Open the "PLC tags" folder under the CPU in the project tree.
2. Double-click the PLC tag table in the folder.
3. Select the desired tab in the upper corner.

Result

The PLC tag table associated with the CPU opens. You can declare the required tags and constants.

See also

Overview of PLC tag tables (Page 824)

Structure of the PLC tag tables (Page 825)

9.1.2.4 Declaring PLC tags

Rules for PLC tags

Valid names of PLC tags

Permissible characters

The following rules apply to the use of names for PLC tags:

- Letters, numbers, special characters are permitted.
- Quotation marks are not permitted.

Unique tag names

The names of the PLC tags must be unique throughout the CPU, even if the tags are located in different tag tables of a CPU. A name that is already used for a block, another PLC tag or a constant within the CPU, cannot be used for a new PLC tag. The uniqueness check does not differentiate between use of small and capital letters.

If you enter an already assigned name another time, a sequential number is automatically appended to the second name entered. For example, if you enter the name "Motor" a second time, the second entry is changed to "Motor(1)".

Unique table names

The names of the PLC tag tables must also be unique throughout the CPU. A unique name is automatically suggested when user-defined PLC tag tables are being created.

See also

Using tags within the program (Page 717)

Permissible addresses and data types of PLC tags (Page 829)

Reserved key words (Page 719)

Permissible addresses and data types of PLC tags

The addresses of PLC tags are made up of the particulars of the operand area and the address within this area.

The addresses must be unique throughout the CPU. If you enter an address that is already assigned to another tag, the address will be highlighted at both places in yellow and an error message will be issued.

Operand areas

The following table shows the possible operand areas. The available data types depend on the CPU you use:

Operand area		Description	Data type	Format	Address area:	
International mnemonics	German mnemonics				S7-1200	S7-300/400
I	E	Input bit	BOOL	I x.y E x.y	0.0..1023.7	0.0..65535.7
IB	EB	Input byte	BYTE, CHAR, SINT, USINT	IB x EB y	0..1023	0..65535
IW	EW	Input word	WORD, INT, UINT, DATE, S5TIME	IW x EW y	0..1022	0..65534
ID	ED	Input double word	DWORD, DINT, UDINT, REAL, TIME, TOD	ID x ED y	0..1020	0..65532
Q	A	Output bit	BOOL	Q x.y A x.y	0.0..1023.7	0.0..65535.7
QB	AB	Output byte	BYTE, CHAR, SINT, USINT	QB x AB y	0..1023	0..65535
QW	AW	Output word	WORD, INT, UINT, DATE, S5TIME	QW x AW y	0..1022	0..65534
QD	AD	Output double word	DWORD, DINT, UDINT, REAL, TIME, TOD	QD x AD y	0..1020	0..65532
M	M	Memory bit	BOOL	M x.y	0.0..8191.7	0.0..65535.7
M	M	Memory bit	LREAL	M x.0	0.0..8190.0	-
MB	MB	Memory byte	BYTE, CHAR, SINT, USINT	MB x	0..8191	0..65535
MW	MW	Memory word	WORD, INT, UINT, DATE, S5TIME	MW x	0..8190	0..65534
MD	MD	Memory double word	DWORD, DINT, UDINT, REAL, TIME, TOD	MD x	0..8188	0..65532
T	T	Time function (for S7-300/400 only)	Timer	T n	-	0..65535
C	C	Counter function (for S7-300/400 only)	Counter	Z n C n	-	0..65535

Addresses

The following table shows the possible addresses of tags:

Data type	Address	Example
BOOL	Tags with BOOL data type are addressed with a byte number and a bit number. The numbering of the bytes begins for each operand area at 0. The numbering of the bits goes from 0 to 7.	A 1.0
BYTE, CHAR, SINT, USINT	Tags with BYTE, CHAR, SINT, and USINT data type are addressed with a byte number.	MB 1
WORD, INT, UINT, DATE	Tags with WORD, INT, UINT, DATE data type consist of two bytes. They are addressed with the number of the lowest byte.	IW 1
DWORD, DINT, UDINT, REAL, TIME	Tags with DWORD, DINT, UDINT, REAL, TIME data type are made up of four bytes. They are addressed with the number of the lowest byte.	AD 1

Mnemonics used

The addresses that you enter in the PLC tag table are automatically adapted to the set mnemonics.

See also

Setting the mnemonics (Page 895)

Using tags within the program (Page 717)

Valid names of PLC tags (Page 829)

Overview of the valid data types (Page 741)

Entering a PLC tag declaration

Declaring tags in the PLC tag table

Requirements

The "Tags" tab of the PLC tag table is open.

Procedure

To define PLC tags, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter the required data type in the "Data type" column. You will be supported by autocompletion during input.

   An address corresponding to the data type is automatically appended.
3. Optional: Click on the arrow key in the "Address" column and enter an operand identifier, an operand type, an address and a bit number in the dialog which then opens.
4. Optional: Enter a comment in the "Comments" column.
5. Repeat steps 1 to 4 for all the tags you require.

See also: Permissible addresses and data types of PLC tags (Page 829)

Syntax check

A syntax check is performed automatically after each entry, and any errors found are displayed in red. You do not have to correct these errors immediately - you can continue editing and make any corrections later. As long as the tag declaration contains syntax errors and the tag is used in the program, you will not be able to compile the program.

See also

Importing and exporting (Page 1200)

Valid names of PLC tags (Page 829)

Declaring PLC tags in the program editor (Page 832)

Structure of the PLC tag tables (Page 825)

Declaring PLC tags in the program editor

Requirement

- The program editor is open.

Procedure

To declare operands as global PLC tags, follow these steps:

1. Insert an instruction in your program.

   The "<???>", "<??.?>" or "..." strings represent operand placeholders.

2. Replace an operand placeholder with the name of the PLC tag to be created.

3. Select the tag name.

   If you want to declare multiple PLC tags, select the names of all the tags to be declared.

4. Select the "Define tag" command in the shortcut menu.

   The "Define tag" dialog box opens. This dialog displays a declaration table in which the name of the tag is already entered.

5. Click the arrow key in the "Section" column and select one of the following entries:

   – Global Memory

   – Global Input

   – Global Output

6. In the other columns, enter the address, data type, and comments.

   See also: Permissible addresses and data types of PLC tags (Page 829)

7. If the CPU contains multiple PLC tag tables, you can use an entry in the "PLC tag table" column to indicate in which table the tag is to be inserted. If you make no entry in the column, the new tag will be inserted in the default tag table.

8. Click the "Define" button to complete your entry.

Result

The tag declaration is written to the PLC tag table and is valid for all blocks in the CPU.

See also

Valid names of PLC tags (Page 829)

Declaring tags in the PLC tag table (Page 831)

Setting the retentivity of PLC tags

Retentive behavior of PLC tags

Retentive memory areas for PLC tags

To prevent data loss in the event of power failure, you can define a part of the CPU's system memory as retentive. Values of PLC tags that tile in the retentive memory area are preserved even when the power supply is switched off.

You specify the exact width of the retentive memory area in the PLC tag table.

See also

Setting the retentive behavior of PLC tags (Page 834)

Setting the retentive behavior of PLC tags

Introduction

In the PLC tag table you can specify the width of the retentive memory area for PLC tags. All tags with addresses in this memory area are then designated as retentive. You can recognize the retentivity setting of a tag by the check mark set in the "Retain" column of the PLC tag table.

Requirement

The "PLC tags" tab of the PLC tag table is open.

Procedure

To define the width of the retentive memory area for PLC tags, follow these steps:

1. On the toolbar, click the "Retain" button.

   The "Retain memory" dialog will open.
2. Specify the width of the retentive memory area by entering the number of memory bytes in the input field.
3. Click the "OK" button.

Result

The width if the retentive memory area is defined. In the "Retain" column of the tag table a check mark is automatically set for all tags that are located within the retentive memory area.

See also

Retentive behavior of PLC tags (Page 834)

9.1.2.5 Declaring symbolic constants

Rules for symbolic constants

Permissible characters

Names of symbol constants may consist of the following characters:

- Letters, numbers, special characters are permitted.
- Quotation marks are not permitted.

Unique constant names

The names of the symbolic constants must be unique throughout the CPU, even if the constants are located in different tag tables of a CPU. A name that is already used for a block, a PLC tag or another constant within the CPU, cannot be used for new constant. The uniqueness check does not differentiate between use of small and capital letters.

If you enter an already assigned name another time, a sequential number is automatically appended to the second name entered. For example, if you enter the name "Motor" a second time, the second entry is changed to "Motor(1)".

Permissible data types

For constants, all data types supported by the CPU are permitted, with the exception of structured data types.

Permitted values

You can select any value from the value range of the specified data type as constant value. For information on the value ranges, refer to the "Data types" chapter.

See also: Data types (Page 741)

See also

Constants (Page 718)

Declaring constants (Page 835)

Declaring constants

Introduction

You declare constants in the "User constants" tab of a PLC tag table. During declaration you have to to enter a symbolic name, a data type and a fixed value for each constant. The entry format and the value range of the constant value depend on the data type of the constant.

See also: Data types (Page 741)

Procedure

To declare constants, follow these steps:

1. Open a PLC tag table.
2. Open the "User constants" tab.

   The constants table opens.
3. Enter a constant name in the "Name" column.
4. Enter the required data type in the "Data type" column. You will be supported by autocompletion during input.
5. Enter a constant value in the "Value" column; this constant value must be valid for the selected data type.
6. If you want, enter comments on the constants in the "Comments" column. The entry of a comment is optional.
7. If you want to declare additional constants, place the cursor in the next row and repeat steps 3 to 6.

Syntax check

A syntax check is performed automatically after each entry, and any errors found are displayed in red. You do not have to correct these errors immediately - you can continue editing and make any corrections later. As long as the tag declaration contains syntax errors and the constant is used in the program, you will not be able to compile the program.

9.1.2.6 Editing properties

Editing the properties of PLC tags

Properties of PLC tags

Overview

The following table gives an overview of the properties of PLC tags:

Group	Property	Description
General	Name	A unique name within the CPU.
	Data type	Data type of the tags.
	Address	Tag address.
	Comment	Comment on the tag.
Time stamp	Date created	Time when the tag was created (cannot be changed).
	Last modified	Time when the tag was last changed (cannot be changed).
Usage	Visible in HMI	Shows whether the tag is visible by default in the HMI selection list.
	Accessible from HMI	Shows whether HMI can access this tag during runtime.

See also

Editing the properties of PLC tags (Page 837)

Editing the properties of PLC tags

Editing properties in a PLC tag table

To edit the properties of one or more tags, follow these steps:

1. In the project tree, double-click the PLC tag table that contains the tags.

   The PLC tag table opens.

2. Change the entries in the columns.

Editing addresses in the program editor

To edit the address of a tag in the program editor, follow these steps:

1. Select the tag name.
2. Select the "Rewire tag" command in the shortcut menu.

   The "Rewire tag" dialog will open. The dialog shows a declaration table.
3. Enter the new address in the "Address" column.
4. Click the "Change" button to confirm the input.

Editing names in the program editor

To edit the name of a tag in the program editor, follow these steps:

1. Select the tag name.
2. Select the "Rename tag" command in the shortcut menu.

   The "Rename tag" dialog opens. The dialog shows a declaration table.
3. Enter the new name in the "Name" column.
4. Click the "Change" button to confirm the input.

Effect in the program

In the case of a change of the tag's name, data type or address, each location of use of the tag is automatically updated in the program.

Properties of constants

Overview

The following table gives an overview of the properties of constants:

Group	Property	Description
General	Name	A unique name within the table
	Data type	Data type of the constants
	Value	Value that you defined for the constants. This value must be compatible with the declared data type. See also: Data types (Page 741)
	Comment	Comment on the constants
History	Date created	Time when the constant was created (cannot be changed)
	Last modified	Time when the constant was last changed (cannot be changed)

Editing properties of constants

Editing properties in a PLC tag table

To edit the properties of one or more constants, follow these steps:

1. In the project tree, double-click the PLC tag table that contains the constants.

   The PLC tag table opens.
2. Open the "User constants" tab.
3. Change the entries in the "Name", "Data type", "Value", or "Comments" column.

Effect in the program

In the case of a change of a constant's name, data type or value, each location of use of the constant is automatically updated in the program.

See also

Data types (Page 741)

9.1.2.7 Monitoring of PLC tags

Monitoring of PLC tags

You can monitor the current data values of the tags on the CPU directly in the PLC tag table.

Requirements

An online connection to the CPU is available.

Procedure

To monitor the data values, proceed as follows:

1. Open a PLC tag table.
2. Start monitoring by clicking the "Monitor all" button.

   The additional "Monitor value" column is displayed in the table. This shows the current data values.
3. End the monitoring by clicking the "Monitor all" button again.

Note

You also have the option of copying PLC tags to a monitor or force table so that you can monitor, control or force them in the table.

See also

Structure of the PLC tag tables (Page 825)

Introduction to testing with the watch table (Page 1133)

Introduction for testing with the force table (Page 1156)

Copying entries in the PLC tag table (Page 841)

9.1.2.8 Editing PLC tag tables

Inserting a table row in the PLC tag table

Procedure

Proceed as follows to insert a row above the selected row:

1. Select the row in front of which you want to insert a new row.
2. Click the "Insert row" button on the toolbar of the table.

Result

A new row is inserted above the selected row.

Copying entries in the PLC tag table

You can copy PLC tags within a table or to other tables.

Procedure

To copy a tag, follow these steps:

1. Select the tags you want to copy.

   You can also select several tags by clicking on them one after the other while holding down the <Ctrl> key or by pressing and holding down <Shift> and clicking on the first and last tag.
2. Select "Copy" in the shortcut menu.
3. Position the insertion pointer at the location where you want to insert the tags.
4. Select "Paste" in the shortcut menu.

Or

1. Select the tag.
2. Hold down the left mouse button.
3. At the same time, press <Ctrl>.
4. Drag the tag to the destination.

Result

- The tag is copied to the destination.
- If there is a name conflict, a number is automatically appended to the tag name. For example, "Tag" becomes "Tag(1)".
- All other properties of the tag remain unchanged.

Deleting entries in the PLC tag table

Procedure

To delete a tag, follow these steps:

1. Select the row with the tag to be deleted. You can also select several rows by clicking on them one after the other while holding down the <Ctrl> key or by pressing and holding down <Shift> and clicking on the first and last row.
2. Select the "Delete" command in the shortcut menu.

Sorting rows in the PLC tag tables

You can sort the rows in the tables alphanumerically by name, data type, or address.

Procedure

To sort the table rows, follow these steps:

1. Select the column by which you want to sort.
2. Click the column header.

   The column will be sorted in order of increasing values.

   An up arrow shows the sort sequence.
3. In order to change the sort sequence, click the arrow.

   The column will be sorted in order of decreasing values. A down arrow shows the sort sequence.
4. To restore the original sequence, click a third time on the column header.

Automatically filling in cells in the PLC tag table

You can load the contents of one or several table cells into the cells below, automatically filling in the successive cells.

If you automatically fill in cells in the "Name" column, a consecutive number will be appended to each name. For example, "Motor" will become "Motor_1".

If you fill the cells in the column "Address" automatically, the addresses will be increased depending on the indicated data type.

Procedure

To automatically fill in successive cells, follow these steps:

1. Select the cells to be loaded.
2. Click the "Fill" symbol in the bottom right corner of the cell.

   The mouse pointer is transformed into a crosshair.
3. Keep the mouse button pressed and drag the mouse pointer downwards over the cells that you want to fill in automatically.
4. Release the mouse button.

   The cells are filled in automatically. If entries are already present in the cells that are to be automatically updated, a dialog appears in which you can indicate whether you want to overwrite the existing entries or whether you want to insert new rows for the new tags.

Show and hide table columns

You can show or hide the columns in a table as needed.

Procedure

To show or hide table columns, follow these steps:

1. Click a column header.
2. In the shortcut menu, select the "Show/hide columns" command.

   The selection of available columns is displayed.
3. To show a column, select the column's check box.
4. To hide a column, clear the column's check box.

Editing PLC tags with external editors

To edit individual PLC tags in external editors outside the TIA portal, you can export or import these tags using copy and paste. However, you cannot copy structured tags to an editor.

Requirement

A PLC tag table and an external editor are opened.

Procedure

To export and import individual PLC tags, follow these steps:

1. Select one or more PLC tags.
2. Select "Copy" in the shortcut menu.
3. Switch to the external editor and paste the copied tags.
4. Edit the tags as required.
5. Copy the tags in the external editor.
6. Switch back to the PLC tag table.
7. Select "Paste" in the shortcut menu.

Note

You also have the option of export or importing PLC tags as mass data.

See also: Importing and exporting (Page 1200)

9.1.3 Creating and managing blocks

9.1.3.1 Creating blocks

Block folder

Function

You can find a "Program blocks" folder in the project tree, in which you can create and manage the following blocks:

- Organization blocks (OB)
- Function blocks (FB)
- Functions (FCs)
- Data blocks (DB)

A "System blocks" subfolder containing another subfolder, "Program resources", is also created in the "Program blocks" folder the first time you drag an instruction to your program which is an internal system function block. The instance data block of the internal system function block is also pasted to the "Program resources" folder. You can move or copy such instance data blocks from the "Program resources" folder to any other folder and rename or delete them. You can also move your blocks into the "Program resources" folder. Blocks in the "Program resources" folder that are not required to run the user program are removed during the next compilation. If the "Program resources" folder contains no more blocks then it is also deleted with the "System blocks" folder.

A program cycle OB is automatically generated for each device and inserted in the "Program blocks" folder.

Creating organization blocks (Page 844)

Using blocks from libraries (Page 848)

Creating organization blocks

Requirement

The "Program blocks" folder in the project tree is open.

Procedure

To create an organization block, follow these steps:

1. Double-click the "Add new block" command.

   The "Add new block" dialog box opens.
2. Click the "Organization block (OB)" button.
3. Select the type of new organization block.
4. Enter a name for the new organization block.
5. Enter the properties of the new organization block.
6. To enter additional properties for the new organization block, click "Additional information".

   An area with further input fields is displayed.
7. Enter all the properties you require.
8. Activate the "Add new and open" check box if the organization block does not open as soon as it is created.
9. Confirm your entries with "OK".

Result

The new organization block is created. You can find the organization block in the project tree in the "Program blocks" folder. You can assign additional parameters to some organization blocks in the inspector window or device view after they have been created. The organization block description will state whether the newly created organization block has additional parameters.

Entering a block title (Page 851)

Entering a block comment (Page 852)

Creating functions and function blocks

Requirement

The "Program blocks" folder in the project tree is open.

Procedure

To create a function (FC) or a function block (FB), follow these steps:

1. Double-click the "Add new block" command.

   The "Add new block" dialog box opens.
2. Click the "Function block (FB)" or "Function (FC)" button.
3. Enter a name for the new block.
4. Enter the properties of the new block.
5. To enter additional properties for the new block, click "Additional information".

   An area with further input fields is displayed.
6. Enter all the properties you require.
7. Activate the "Add new and open" check box if the block does not open as soon as it is created.
8. Confirm your entries with "OK".

Result

The new block is created. You can find the block in the project tree in the "Program blocks" folder.

Creating data blocks

Requirements

The "Program blocks" folder in the project tree is open.

Procedure

To create a data block, follow these steps:

1. Double-click the "Add new block" command.

   The "Add new block" dialog box opens.

2. Click the "Data block (DB)" button.

3. Select the type of the data block. You have the following options available to you:

   – To create a global data block, select the list entry "Global DB".

   – To create an instance data block, select the function block to which you want to assign the instance data block from the list. The list contains only the function blocks that were previously created for the CPU.

   – To create a data block based on a PLC data type, select the PLC data type from the list. The list contains only the PLC data types that were previously created for the CPU.

   – To create a data block based on a system data type, select the system data type from the list. The list contains only those system data types that have already been inserted to program blocks in the CPU.

4. Enter a name for the data block.

5. Enter the properties of the new data block.

   – Select whether you want to assign the block number manually or automatically. Enter a number if you decide to use manual assignment.

   – Select the type of the block access (for S7-1200 only).

6. To enter additional properties of the new data block, click "Additional information".

   An area with further input fields is displayed.

7. Enter all the properties you require.

8. Activate the "Add new and open" check box if the block does not open as soon as it is created.

9. Confirm your entry with "OK".

Result

The new data block is created. You can find the data block in the project tree in the "Program blocks" folder.

Using blocks from libraries

You can save blocks in the project library or in a global library, so that you can use them more than once within a user program.

Requirement

- The "Libraries" task card is displayed.
- No write protection is set for global libraries.

Adding blocks to the project library or to a global library

To add new blocks to the project library or to a global library, follow these steps:

1. Maximize the project library or the global library.
2. Use drag-and-drop to move the block you wish to add to the library to the "Master copies" folder or any one of the "Master copies" subfolders in the project library or a global library. Don't release the left mouse button until a small plus sign appears underneath the mouse pointer.

Using blocks of the project library or a global library

To use a block from the project library or a global library in your project, follow these steps:

1. Maximize the project library or the global library so that you can see the block you wish to use.
2. Use a drag-and-drop operation to move the block to the CPU block folder. If the selected insertion points is not allowed, the mouse pointer will appear as a circle with a slash.

Copying and pasting blocks

Basics of copying and pasting blocks

Function

You can also create new blocks by copying existing blocks and pasting the copy. Observe the following principles when using this method:

- You can copy organization blocks (OBs), functions (FCs), function blocks (FBs), and global data blocks (DBs) without restriction.
- You can copy instance data blocks only for the same function block, since the assignment to the function block cannot be changed afterwards. However, the assignment is canceled if you copy the instance data block to a different CPU. If a function block with the same number exists there, the instance data block will be assigned to this function block. If you copy the instance data block together with the function block into the other CPU, the instance data block is assigned to the copy of the function block.

Copying data

With paste, all the block data is copied and forwarded to the copy. This data includes:

- Block interface tags
- All networks
- Comments in all existing compilations
- Messages defined in the block
- The entire program code of the copied block including the call instructions contained in the block.

  However, called blocks and their associated instance data blocks are not copied.

Avoiding name conflicts during pasting

When pasting copied blocks with identical names to already existing blocks, the following mechanisms are used to avoid name conflicts:

- Pasting the copied block into the same CPU:

  The copy of the block gets a name that is extended by a number. For example, if block "A" is copied, a possible name for the copy is "A_1". Consecutive numbering is not used, but rather the smallest free number. The copy of block "A" can also get the name "A_25", if no lower number is available.
- Pasting the copied block into another CPU:

  A dialog box opens in which you can select whether the block with the same name will be replaced or the copied block will be pasted with a duplicate designation (Name_Number).

NOTICE
Number conflicts may occur, if the pasted block has the same block number as an existing block. The block number is not automatically changed during pasting. This double number may have an effect on block calls. When you copy blocks you should therefore check the block number carefully and correct duplicate block numbers manually or using the block properties.

See also

Copying blocks (Page 850)

Pasting blocks (Page 850)

Copying blocks

Requirement

The "Program blocks" folder is opened in the project tree.

Procedure

To copy a block, follow these steps:

1. Right-click the block that you want to copy.
2. Select "Copy" in the shortcut menu.

Result

A copy of the block is now on the clipboard and can be pasted either into the same CPU or into another one.

See also

Basics of copying and pasting blocks (Page 849)

Pasting blocks (Page 850)

Pasting blocks

Requirement

You have copied a block.

Procedure

To paste a copied block and its data into a CPU, follow these steps:

1. In the project tree, open the folder structure for the CPU into which you want to paste the copied block.

   Note

   Please note that you can only paste the copied block into a CPU which supports the block programming language and type.

   ---

2. Right-click on the "Program blocks" folder.
3. Select "Paste" in the shortcut menu.
   – If you are pasting the block into the same CPU as the original block, "_<consecutive number>" will be appended to the name of the copy.
   – If you are pasting the block into a different CPU where a block of the same name already exists, the "Paste" dialog box opens. Select the required option and confirm with "OK".

Copying blocks (Page 850)

Entering a block title

The block title is the title of the block. It is not the same thing as the block name, which was assigned when the block was created. The length of the block title is restricted to one row. You can enter the block title for open and closed blocks.

Requirement

A code block is available.

Enter block title for open block

To insert the block title in an open block, follow these steps:

1. Click on the title bar of the block in the program editor.
2. Enter the block title.

Enter block title for closed blocks

To insert the block title in a closed block, follow these steps:

1. Right-click the block in the project tree.
2. Select the "Properties" command in the shortcut menu.

   The dialog with the properties of the block opens.
3. Select the entry "Information" in the area navigation.
4. Enter the block title in the "Title" input field.
5. Confirm your entry with "OK".

Entering a block comment (Page 852)

Entering a block comment

You can use the block comment to document the entire code block. For example, you can indicate the purpose of the block or draw attention to special characteristics. You can enter the block comment for open and closed blocks.

Requirement

A code block is available.

Enter block comment for open blocks

To insert a block comment in an open block, proceed as follows:

1. Click the small arrow in front of the block title.

   The right arrow becomes a down arrow, and the comment area is displayed.
2. Click "Comment" in the comment area.

   The "Comment" text passage is selected.
3. Enter the block comment.

Enter block comments for closed blocks

To insert the block comment in a closed block, follow these steps:

1. Right-click the block in the project tree.
2. Select the "Properties" command in the shortcut menu.
   The dialog with the properties of the block opens.
3. Select the entry "Information" in the area navigation.
4. Enter the block comment in the "Comment" input field.
5. Confirm your entry with "OK".

9.1.3.2 Specifying block properties

Basics of block properties

Block properties

Each block has certain properties, which you can display and edit. These properties are used amongst other things to:

- Identify the block
- Display the memory requirements and the compilation status of the block
- Display the time stamp
- Display the reference information
- Specify the access protection

See also

Setting the mnemonics (Page 895)

Overview of block properties

Overview

The properties of the blocks are block and CPU-specific. Not all properties are therefore available for all blocks or in all CPU families. The following table gives an overview of block properties:

Group	Property	Description
General	Name	Unique block name within the station
	Constant name	Name of the constant pasted for the OB in the PLC tag table
	Type	Block type (cannot be changed)
	Number	Block number
	Event class	Event class of an OB (cannot be changed)
	Language	Programming language of the block
	Language in networks	Language used to program conditions in GRAPH blocks.
Information	Title	Block title
	Comment	Block comment
	Version	Version number of the block
	Family	Block family name
	Author	Name of the author, company name, department name, or other names
	User-defined ID	ID created by the user
Time stamps	Block	Times of creation and time of change of the block (cannot be changed)
	Interface	Time of creation of the block interface (cannot be changed)
	Code	Code modification time (non-editable)
	Data	Data modification time (non-editable)
Compilation	Status	Details of the last compilation run (cannot be changed)
	Lengths	Details of the block lengths (cannot be changed)
Protection	Protection	Setting up know-how protection and copy protection for the block See also: Protecting blocks
Attributes	Optimized block access	The tag declaration for blocks with optimized access contains only the symbolic names of the data elements. The addresses are automatically optimized and managed by the system. The performance of the CPU is improved, and access errors such as those from SIMATIC-HMI cannot occur. See also: Basics of block access (Page 700)
	IEC Check	The compatibility of the operands in comparison operations and arithmetic operations are tested according to IEC 61131. You have to explicitly convert non-compatible operands. See also: Overview of data type conversion (Page 780)
	Handle errors within block	Error handling inside the block with the GetError or GetErrorID instruction (cannot be changed). See also: Handling program execution errors (Page 1009)

Group	Property	Description
	Create extended status information	Allows you to monitor all tags in an SCL block. This option does, however, increase the program memory space required and the execution times.
	Check ARRAY limits	Checks whether field indexes are within the range declared for an ARRAY during the runtime of an SCL block. The block enable output ENO is set to "0" if a field index is outside of the permitted range.
	Set ENO automatically	Checks whether errors occur in the processing of certain instructions during the runtime of an SCL block. The block enable output ENO is set to "0" if a runtime error occurs.
	Create minimized DB	Generates instance data blocks for GRAPH data blocks in minimized format. This option reduces the GRAPH FB memory space required, however you will only receive limited program status information.
	Skip steps	If the transitions before and after a step become valid simultaneously in a GRAPH block, the step will not be activated and will be skipped.
	Acknowledgment required for supervision errors	Any supervision error which occurs during the operation of a GRAPH block must be acknowledged before the program can continue.
	Permanent processing of all interlocks in manual mode	Permanently monitors all interlock conditions in a GRAPH block in manual mode.
	Lock operating mode selection	Prevents a GRAPH block operating mode being selected.
	Data block write-protected in the device	Indicates whether the data block is read-only in the target system, and cannot be overwritten while the program is running (for data blocks only)
	Only store in load memory	On activation the data block is stored only in the load memory, occupies no space in the work memory, and is not linked into the program. The "Instructions" task card in the "Move" section offers options for the transfer of data blocks to the work memory. (only for data blocks)
Triggers	Triggers	Assigns the organization block to event by means of which it can be started. (only hardware interrupt OB) See also: Assigning parameters to hardware interrupt OBs
Cyclic interrupt	Cyclic interrupt	Settings for the cyclic interrupt OB See also: Assigning parameters to cyclic interrupt OBs

Block time stamps (Page 856)

Displaying and editing block properties (Page 858)

Block time stamps

Introduction

Blocks receive a number of different time stamps which show you when the block was created and when it was last changed. These time stamps are also used for automatic consistency checks before compilation.

Code block time stamps

The following time stamps are generated for code blocks (OBs, FBs, FCs):

- Block: Created on, Modified on
- Interface: Modified on
- Code/data: Modified on

A time stamp conflict is displayed during compilation if the time stamp for the block calling is older than that of the interface for the block called.

Time stamps for code blocks are updated as follows:

- Block: The time stamp for the last block modification is always the same as the time stamp either of the interface or of the code depending on which area was modified last.
- Interface: The interface time stamp is updated each time the interface is modified. Even if you manually undo a change to the interface, for example change the name back, that is also a change which updates the time stamp. However, if you undo the change using the "Undo" function, the time stamp will be reset to the value it had before the undone change.
- Code/data: The code time stamp is updated each time the block code is changed. Even if you manually undo a change to the code, for example remove an instruction, that is also a change which will update the time stamp. However, if you undo the change using the "Undo" function, the time stamp will be reset to the value it had before the undone change.

Global data block time stamps

The following time stamps are generated for global data blocks:

- Block: Created on, Modified on
- Interface: Modified on
- Data: Modified on

Time stamp conflict is reported during compilation of a global data block based on a PLC data type if the time stamp of the global data block is older than the time stamp of the PLC data type used.

The time stamps for global data blocks are updated as follows:

- Block: The time stamp for the last change to a global data block is always the same as the time stamp for the interface and the data.
- Interface and data: The interface time stamps and the data are updated each time the global data block is changed. Even if you manually undo a change, for example remove a tag, that is also a change which will update the time stamp. However, if you undo the change using the "Undo" function, the time stamps will be reset to the value they had before the undone change.

Instance data block time stamps

The following time stamps are generated for instance data blocks:

- Block: Created on, Modified on
- Interface: Modified on
- Data: Modified on

A time stamp conflict will be reported during compilation of an instance data block if the interface time stamps of the instance data block are not identical to those of the function block.

The time stamps for instance data blocks are updated as follows:

- Block: The time stamp for the last change to an instance data block is always the same as the time stamp for the interface and the data.
- Interface and data: The interface time stamps and the data are updated each time the instance data block is changed. Even if you manually undo a change, for example cancel the tag retain setting, that is also a change which will update the time stamps. However, if you undo the change using the "Undo" function, the time stamps will be reset to the value they had before the undone change.

PLC data type time stamps

The following time stamps are generated for PLC data types:

- Block: Created on, Modified on
- Interface: Modified on

The time stamps for PLC data types are updated as follows:

- Block: The time stamp for the last change to a PLC data type is always the same as the interface time stamp.
- Interface: The interface time stamp is updated each time the PLC data type is changed. Even if you manually undo a change, for example delete the content of a PLC data type, that is also a change which will update the time stamp. However, if you undo the change using the "Undo" function, the time stamp will be reset to the value it had before the undone change.

Basic information on compiling blocks (Page 1071)

Displaying and editing block properties

The properties of the blocks are block and CPU-specific. Not all properties are therefore available for all blocks or in all CPU families. Properties that can only be displayed are write-protected.

Displaying and editing properties of a closed block

To display and edit the properties of a closed block, follow these steps:

1. Open the "Program blocks" folder in the project tree.
2. Right-click the block whose properties you want to display or edit.
3. Select the "Properties" command in the shortcut menu.

   The properties dialog box of the block opens.
4. In the area navigation, click a group whose properties you want to display or edit.
5. Change the relevant property.
6. Confirm your entries with "OK".

Displaying and editing properties of an open block

To display or edit the properties of an open block, follow these steps:

1. Select the "Inspector window" check box in the "View" menu.

   The Inspector window opens.
2. Click the "Properties" tab.

   The properties of the block are shown in the "Properties" tab of the Inspector window.
3. In the area navigation, click a group whose properties you want to display or edit.
4. Change the relevant property.

Result

The properties of the block will be changed. The changes are not saved until the project is saved.

9.1.3.3 Managing blocks

Opening blocks

Requirement

The "Program blocks" folder in the project tree is open.

Procedure

To open a block, follow these steps:

1. Double-click on the block you wish to open.

Result

The block will open in the program editor.

See also

Saving blocks (Page 860)

Closing blocks (Page 860)

Renaming blocks (Page 861)

Deleting blocks offline (Page 861)

Deleting blocks online (Page 862)

Opening know-how protected blocks (Page 1089)

Saving blocks

Blocks are always saved together with the project. Faulty blocks can also be saved. This allows the error to be resolved at a convenient time.

Procedure

To save a block, follow these steps:

1. Select the "Save" or "Save as" command in the "Project" menu.

   See also: Saving projects (Page 213)

See also

Opening blocks (Page 859)

Closing blocks (Page 860)

Renaming blocks (Page 861)

Deleting blocks offline (Page 861)

Deleting blocks online (Page 862)

Closing blocks

Procedure

To close a block, follow these steps:

1. Click the "Close" button in the title bar of the program editor.

NOTICE
Note that the block will not be saved on closing.

See also

Opening blocks (Page 859)

Saving blocks (Page 860)

Renaming blocks (Page 861)

Deleting blocks offline (Page 861)

Deleting blocks online (Page 862)

Renaming blocks

Requirement

The "Program blocks" folder is opened in the project tree.

Procedure

To change the name of a block, follow these steps:

1. Right-click the block that you want to rename.
2. Select the "Rename" command in the shortcut menu.

   The block name in the project tree changes to an input field.
3. Input the new name for the block.
4. Confirm your entry with the Enter key.

Result

The name of the block is now changed at all points of use in the program.

Opening blocks (Page 859)

Saving blocks (Page 860)

Closing blocks (Page 860)

Deleting blocks offline (Page 861)

Deleting blocks online (Page 862)

Deleting blocks offline

Requirement

The "Program blocks" folder opens in the project tree.

Procedure

To delete a block that exists offline, proceed as follows:

1. In the project tree in the "Program blocks" folder, right-click on the block that you want to delete.
2. Select the "Delete" command in the shortcut menu.
3. Confirm the safety prompt with "Yes".

   The block is deleted offline from the project.

Note

If you are deleting organization blocks, note that events may be assigned to these blocks. If you delete such organization block the program cannot respond to parameterized events.

Opening blocks (Page 859)

Saving blocks (Page 860)

Closing blocks (Page 860)

Renaming blocks (Page 861)

Deleting blocks online (Page 862)

Deleting blocks online

Note

S7-1200 Version 1.0

If you delete online blocks, the CPU will execute a cold restart the next time it switches to RUN mode. Apart from deleting the inputs, initializing the outputs and deleting the non-retentive memory, cold restart also deletes the retentive memory areas. All subsequent changes from STOP to RUN are warm restarts in which the retentive memory is not deleted.

Requirement

The "Program blocks" folder in the project tree is open.

Procedure

To delete a block that exists online, follow these steps:

1. In the "Program blocks" folder in the project tree, right-click on the block that you wish to delete from the device.
2. Select the "Delete" command in the shortcut menu.

   The "Delete" dialog will open.
3. Select the "Delete from device" option button.
4. Click on "Yes".

   The block will be deleted from the device online.

9.1.4 Programming blocks

9.1.4.1 Program editor

Overview of the program editor

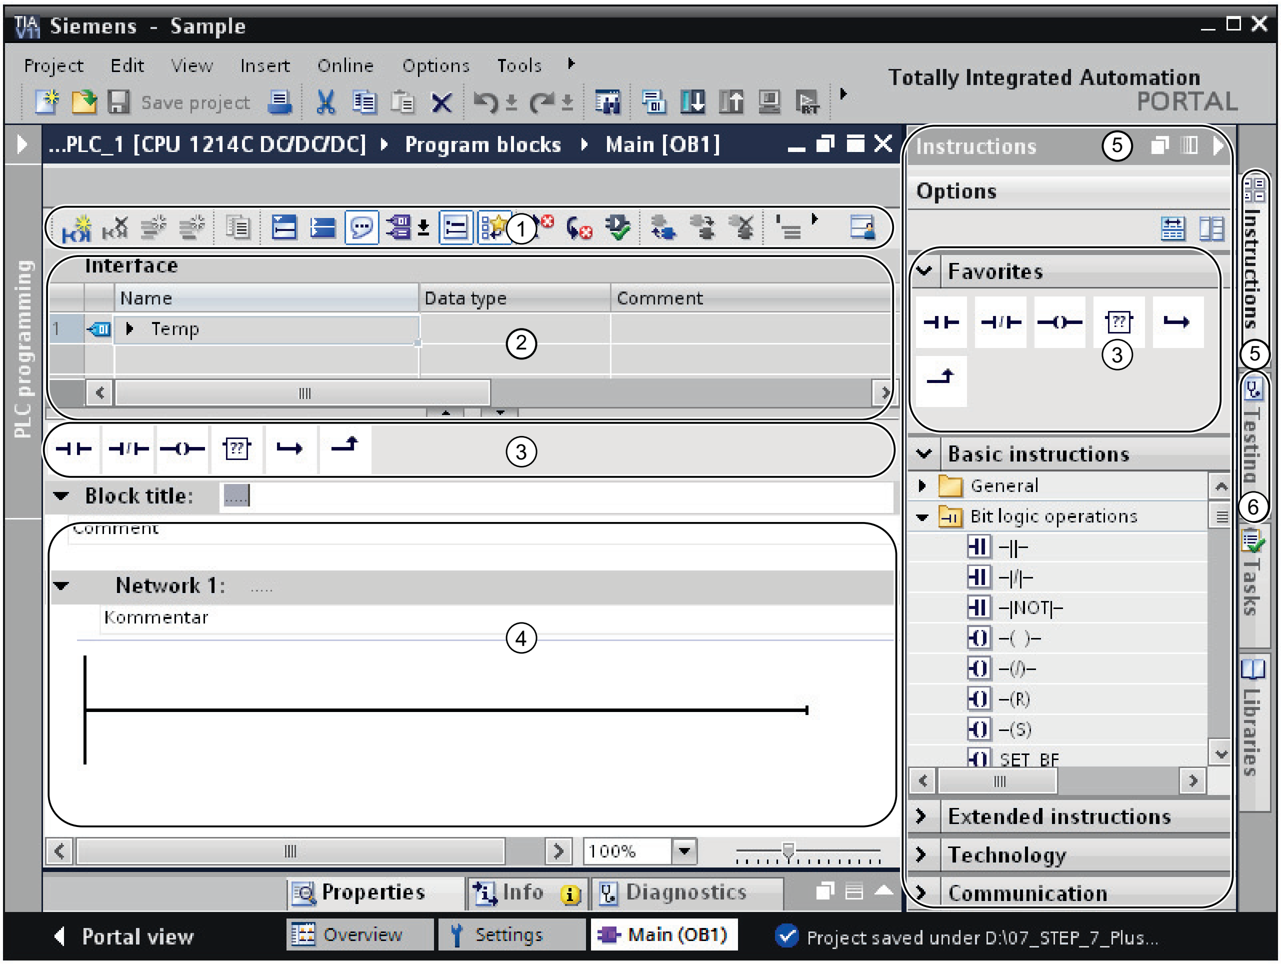
Function of the program editor

The program editor is the integrated development environment for programming functions, function blocks, and organization blocks. If offers comprehensive support for programming and troubleshooting.

The appearance and functionality of the program editor can vary depending on the programming language and the block type used.

Structure of the program editor

Using LAD as an example, the following figure shows the components of the program editor:



① Toolbar
② Block interface
③ "Favorites" pane in the "Instructions" task card and favorites in the program editor
④ Programming window
⑤ "Instructions" task card
⑥ "Testing" task card

Toolbar

The toolbar allows you to access the principal functions of the program editor, such as:

- Show and hide absolute operands
- Show and hide favorites
- Skip to syntax errors
- Update block calls
- Show and hide program status

The functions available in the toolbar can vary depending on the programming language used.

Block interface

The block interface contains the declarations for local tags used solely within the block. The sections available depend on the block type.

Favorites

You can save frequently used instructions as favorites. These favorites are then displayed in the "Instructions" task card and the "Favorites" pane. You can also display favorites in the program editor using the program editor toolbar. This allows you to access your favorites even when the "Instructions" task card is not visible.

Programming window

The programming window is the work area of the program editor. You can enter the program code in this window. The appearance and functionality of the program window can vary depending on the programming language used.

"Instructions" task card

The "Instructions" task card offers you easy access to all instructions available for creating your program. The instructions are broken down by area into a number of different palettes. You can show additional information on the instructions via the "Show column headers and additional columns" button in the task card toolbar.

"Testing" task card

You can set settings in the "Testing" task card for troubleshooting using the program status. The functions of the task card "Testing" are available only in online mode. It contains the following panes which are shown depending on the programming language set for the block:

- CPU operator panel

  The CPU operator panel allows you to switch the CPU operating mode.
- Breakpoints

  You can test blocks you created in the textual programming languages STL and SCL in single step mode. To do this, set breakpoints in the program code.

  You can find, activate, delete, navigate to, or set the call environment for the individual breakpoints you have set in the pane "Breakpoints".
- PLC register

  This pane allows you to read off the values for the PLC registers and the accumulators.
- Sequence control

  In this pane you can set the operating mode for testing sequencers for GRAPH blocks.
- Test settings

  This pane allows you to specify the test settings for the GRAPH block.
- Call environment

  This pane allows you to specify the call environment for the block.
- Call hierarchy

  In this pane, you can trace the call hierarchy of the blocks. You only see the call hierarchy during block monitoring.

Insert input	Insert network input or output	<Alt+3>

Enter operands (LAD/FBD)

Function	Selected object	Keyboard shortcut
Enable the input field for the first operand of the instruction.	Instruction	<Enter> Or <Any letters/numbers> An empty input field opens on <Return>, any letters or numbers will be entered in the entry field.
Enable input field for the operand.	Operand	<F2>
Delete value of the operand.	Operand	<Del>
Define tag	Operand	<Alt+Shift+D>
Entering operands	Input field for operands	<Any letters/numbers>
Confirm entry of the operand.	Input field for operands	<Enter>
Open autocompletion.	Input field for operands	<Ctrl+I>
Discard current change.	Input field for operands	<Esc> The input field is deactivated and the previous content restored.

Process instructions (STL/SCL)

Function	Selected object	Keyboard shortcut
Indent line	Line	<Tab>
Outdent line	Line	<Shift+Tab>
Open "Call options" dialog	Cursor before block call	<Enter>
Define tag	Operand	<Alt+Shift+D>
Open autocompletion.	Any	<Ctrl+I> or <Ctrl+Spacebar>
Set/delete bookmarks		<Ctrl+Alt+B>
To the next bookmark		<Alt+Shift+7>
To the previous bookmark		<Alt+Shift+6>

Monitor program

Function	Keyboard shortcut
Monitor from here	<F5>
Set/delete breakpoint	<F9>
Skip	<F10>
Jump to	<F11>
Execution to selection	<Shift+F5>
Display program status	<Shift+T>
Activate all breakpoints	<Ctrl+Shift+F9>
Deactivate all breakpoints	<Ctrl+Shift+F10>

Enlarging the programming window

Introduction

The programming window is relatively small when all components of the application are shown. If the program code is large, you may find you have to rearrange the work area constantly. To avoid this problem, you can hide or minimize the display of the following components of the application and of the program editor:

- Project tree
- Task cards
- Block interface
- Favorites
- Comments
- Networks

Note

You can also use the "Reduce automatically" option for the task cards, project tree, and Inspector window. These windows will then be minimized automatically when you do not need them.

See also: Maximizing and minimizing the work area

Hiding and showing the project tree

The project tree allows you to access all areas of the project. You can hide the project tree while you are creating a program so you have more space for the programming window.

To show and hide the project tree, follow these steps:

1. To hide the project tree, deselect the "Project tree" check box in the "View" menu, or click on "Collapse" on the project tree title bar.
2. To show the project tree, select the "Project tree" check box in the "View" menu or click on "Extend" on the project tree title bar.

Opening and closing task cards

The task cards are located at the right-hand edge of the programming window.

To open or close the task cards, follow these steps:

1. To close the task cards, deselect the "Task card" check box in the "View" menu or click "Collapse" on the task cards title bar.
2. To open the task cards, select the "Task card" check box in the "View" menu or click "Expand" on the task cards title bar.

Hiding and showing the block interface

The block interface is shown in the upper section of the program editor. During programming you can show and hide it as required.

To show and hide the block interface, follow these steps:

1. In the lower part of the interface within the window splitter, click on the Up arrow or Down arrow.

Showing and hiding favorites

To hide or show the favorites in the program editor, follow these steps:

1. Click the "Display favorites in the editor" button in the program editor toolbar.

Showing and hiding comments

Within a block you can enter a comment for the block or for each network. These two types of comments are shown and hidden differently.

To show or hide a block comment, follow these steps:

1. Click the the triangle at the start of the line with the block title.

To show or hide network comments, follow these steps:

1. Click "Network comments on/off" on the program editor toolbar.

Note

The comments available can vary depending on the programming language used.

Opening and closing networks

Some programming languages use networks. You can open or close these networks as required.

To open or close networks, follow these steps:

1. If you want to open a network, click the right arrow in front of the network title. If you want to close a network, click the down arrow in front of the network title.

To open and close all networks, follow these steps:

1. Click "Open all networks" or "Close all networks" in the program editor toolbar.

> **Note**
>
> Networks are not used in every programming language.

Using autocompletion

Basics of autocompletion

Function

You can use autocompletion in the program window of the program editor as an easy way to access available tags or instructions during programming. Autocompletion means a context-specific list appears in a dialog from which you can select the tags or instructions you need.

See also

Using autocompletion in graphic programming languages (Page 872)

Using autocompletion in textual programming languages (Page 873)

Using autocompletion in graphic programming languages

Inserting tags using autocompletion

To insert tags in graphic programming languages using autocompletion, follow these steps:

1. Select an operand of the instruction to which you wish to assign a tag.

   The input field for the operand will open. The autocompletion button will appear beside the input field.

2. Either click on the autocompletion button or type in the shortcut <Ctrl+I>.

   Autocompletion will open. It will contain only those local and global tags, data blocks and multi-instances which are admissible for the operand in the given context. You can exit autocompletion at any time by pressing <Esc>.

3. Select the required tag from the list. If necessary, you can also filter the list:

   – For example, enter the first few letters of the name of the tag or instruction you wish to insert. Autocompletion will be filtered further with each letter entered. If there is no tag or instruction starting with the letters entered, autocompletion will remain at the last match.

   – Enter # to access the local tags from the block interface.

   – Enter " to access the global tags.

   If the tag is a structured tag, a data block or a multi-instance, then an arrow will be displayed at the end of the row. Click on the arrow to display the subordinate element. You can navigate to the very last level in this way. Use the <Backspace> key to return to the previous level.

4. Press the <Return> key to apply the tag.

Using autocompletion in textual programming languages

Inserting tags and instructions using autocompletion

To insert tags and instructions in textual programming languages using autocompletion, follow these steps:

1. Enter the first few letters of the name of the tag or instruction you wish to insert. If necessary, you can directly filter the kind of tags:
   - Enter # to access the local tags from the block interface.
   - Enter " to access the global tags.

   Autocompletion will open. It will contain only those local and global tags, data blocks, multi-instances and instructions which are admissible in the current position. You can exit autocompletion at any time by pressing <Esc>.
2. Enter more letters of the name of the tag or instruction you wish to insert. Press the <Space bar> to close autocompletion.

   Autocompletion will be filtered further with each letter entered. If there is no tag or instruction starting with the letters entered, autocompletion will remain at the last match.
3. Select the tag or instruction required from the list.

   If the tag is a structured tag, a data block or a multi-instance, then an arrow will be displayed at the end of the row. Click on the arrow to display the subordinate element. You can navigate to the very last level in this way. Use the <Backspace> key to return to the previous level.
4. Press the <Return> key to apply the tag.

General settings for the PLC programming

Overview of the general settings

Overview

The following table shows the general settings that you can make:

Group	Setting	Description
View	With comments	Network comments are shown.
Compilation	Delete actual parameters on interface update	Actual parameters are deleted if the associated formal parameters were deleted in the called block, and you run the "Update block call" function or compile the block.
Default settings for new blocks	IEC check	The compatibility of operands in comparison operations and arithmetic operations are tested according to IEC rules. You have to explicitly convert non-compatible operands.
	Optimized block access (S7-1200)	The tag declaration for blocks with optimized access contains only the symbolic names of the data elements. The addresses are automatically optimized and managed by the system. The performance of the CPU is improved, and access errors such as those from SIMATIC-HMI cannot occur.
Additional settings	Show autocomplete list	The autocomplete list is displayed.
	Mnemonics	German or international designation of operations and operands

See also

Changing the settings (Page 875)

Permissible addresses and data types of PLC tags (Page 829)

Basics of block access (Page 700)

Setting and canceling the IEC check (Page 782)

Changing the settings

Procedure

To change the settings, follow these steps:

1. Select the "Settings" command in the "Options" menu.

   The "Settings" window is displayed in the work area.
2. In the area navigation, select the "PLC programming" group.
3. Change the settings.

Result

The change will be loaded directly, there is no need to save it explicitly.

9.1.4.2 Programming code blocks

Declaring the block interface

Basic information on declaring the block interface

Introduction

The interface contains the declarations of local tags that are used within the block. The tags are subdivided into two groups:

- Block parameters that form the block interface when it is called in the program.
- Local data that are used for storage of intermediate results.

Purpose of tag declaration

You use tag declaration to define the call interface of a block in the program and the names and data types of tags that you want to use in the block.

The interface of function blocks also defines the structure of the instances that are assigned to the function block.

Using POINTER

The following rules apply to declaration of the interface of a function:

- Local tags declared in the section "Input" of the interface cannot be used for the outputs of the programmed instructions or called blocks.
- Local tags declared in the section "Output" of the interface cannot be used for the inputs of the programmed instructions or called blocks.
- Local tags declared in the section "InOut" of the interface can be used for the inputs and outputs of the programmed instructions or called blocks.

The following rules apply to the use of block parameters within a function block (FB):

- Local tags declared in the section "Input" of the interface cannot be used for the outputs of the programmed instructions or called blocks if the IEC check is enabled. Use is possible if the IEC check is disabled.
- Local tags declared in the section "Output" of the interface cannot be used for the inputs of the programmed instructions or called blocks if the IEC check is enabled. Use is possible if the IEC check is disabled.
- Local tags declared in the section "InOut" of the interface can be used for the inputs and outputs of the programmed instructions or called blocks regardless of the IEC check settings.

See also

Using tags within the program (Page 717)

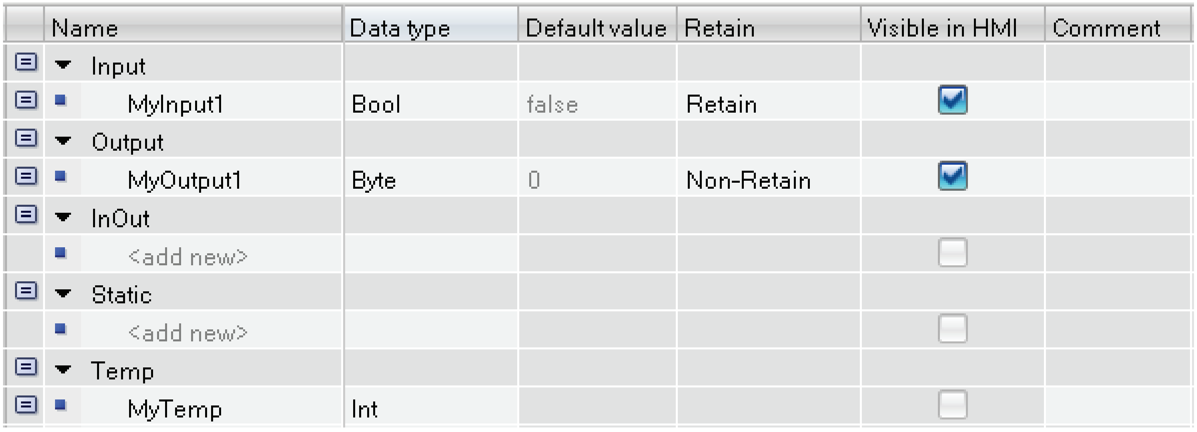
Reserved key words (Page 719)

Layout of the block interface

The block interface allows local tags to be created and managed.

Layout of the block interface

The following figure shows the structure of the block interface. The number of columns and sections varies depending on the type of block.



Name	Data type	Default value	Retain	Visible in HMI	Comment
Input					
MyInput1	Bool	false	Retain	☑	
Output					
MyOutput1	Byte	0	Non-Retain	☑	
InOut					
<add new>				□	
Static					
<add new>				□	
Temp					
MyTemp	Int			□	

Block parameters

The following table shows the types of block parameters:

Type	Section	Function	Available in
Input parameters	Input	Parameters whose values are read by the block.	Functions, function blocks and some types of organization blocks
Output parameters	Output	Parameters whose values are written by the block.	Functions and function blocks
In/out parameters	InOut	Parameters whose values are read by the block when it is called, and whose values are written again by the block after execution.	Functions and function blocks
Return value	Return	Function value that is returned to the calling block.	Functions

Depending on the type of block opened, additional sections may be displayed.

Local data

The following table shows the types of local data:

Type	Section	Function	Available in
Temporary local data	Temp	Tags that are used to store temporary intermediate results. Temporary local data are retained for only one cycle. If you use temporary local data, you have to make sure that the values are written within the cycle in which you want to read them. Otherwise the values will be random.	Functions, function blocks and organization blocks
Static local data	Static	Tags that are used for storage of static intermediate results in the instance data block. Static data is retained until overwritten, which may be after several cycles. The names of the blocks, which are called in this code block as multi-instance, will also be stored in the static local data.	Function blocks

Meaning of the columns

The following table shows the meaning of the individual columns: You can show or hide the columns as required.

Column	Explanation
🏷	Symbol you can click on to drag-and-drop a tag to a program for use as an operand.
Name	Name of the tags.
Data type	Data type of the tags.
Default value	Value with which you pre-assign the tag in the interface of the code block. Specification of the default value is optional. If you do not specify any value the predefined value for the indicated data type is used. For example, the value "false" is predefined for BOOL. The default value is assumed as the start value in the corresponding instance data block. You can replace these values with instance-specific start values in the instance data block. The column is only available in the interface of function blocks.
Retain	Marks the tag as retentive. The values of retentive tags are retained even after the power supply is switched off. This column is only visible in the interface of the function block with optimized access.
Visible in HMI	Shows whether the tag is visible by default in the HMI selection list.
Accessible from HMI	Shows whether HMI can access this tag during runtime. The column is only visible on S7-1200-CPUs.
Comment	Comments to document the tags.

Section	S7-300/400				
	Elementary Data types	Structured Data types	TIMER COUNTER BLOCK	POINTER	ANY
Input	X	X[(1)]	X	X	X
Output	X	X[(1)]	-	X	X
InOut	X	X[(1)]	-	X	X
Temp	X	X	-	-	X
[(1)] STRING can only be defined in the standard length of 254 characters.					

Declaring local tags

Declaring local tags in the block interface

Requirement

The block interface is open.

Procedure

To declare a tag of the elementary data type, follow these steps:

1. Select the appropriate declaration section in the interface:
2. Enter a tag name in the "Name" column.
3. Enter the required data type in the "Data type" column. You will be supported by autocompletion during input.
4. Optional: Change the properties of the tags that are displayed in the other columns of the block interface.

Result

The tag is created.

Syntax check

A syntax check is performed after each entry, and any errors found are displayed in red. You do not have to correct these errors immediately - you can continue editing and make any corrections later. However, you will not be able to compile the program if the tag declaration contains syntax errors.

Note

If you change the interface of a block, the calls of the block in the program will possibly become inconsistent. The call locations are automatically updated, if possible.

If an automatic updating is not possible, the inconsistent blocks have to be updated manually.

Properties of local tags (Page 890)

Setting the retentivity of local tags (Page 891)

Declaring local tags in the program editor

Requirement

The program editor is open.

Procedure

To declare a local tag, follow these steps:

1. Insert an instruction in your program.

   The "<???>", "<??.?>" or "..." strings represent operand placeholders.
2. Replace an operand placeholder with the name of the tag to be created.
3. Select the tag name.

   If you want to declare multiple tags, select the names of all the tags to be declared.
4. Select the "Define tag" command in the shortcut menu.

   The "Define tag" dialog box opens. This dialog displays a declaration table in which the name of the tag is already entered.
5. To declare a local tag, select one of the following sections:
   - Local In
   - Local Out
   - Local InOut
   - Local Static
   - Local Temp
6. In the other columns, enter data type and comments.
7. Click the "Define" button to complete your entry.

Result

The declaration is written directly into the block interface and is valid within the entire block.

Note

If you change the interface of a block, the calls of the block in the program will possibly become inconsistent. The call locations are automatically updated, if possible.

If an automatic updating is not possible, the inconsistent blocks have to be updated manually.

Setting the retentivity of local tags (Page 891)

Declaring tags of the ARRAY data type

Requirement

The block interface is open.

Procedure

To declare a tag of the ARRAY data type, follow these steps:

1. Select the appropriate declaration section in the interface.
2. Enter a tag name in the "Name" column.
3. In the "Data type" column, click the button for the data type selection.

   A list of the permissible data types is opened.
4. Select the "Array" data type.

   The "Array" dialog opens.
5. In the "Data type" text box, specify the data type of the array elements.
6. In the "ARRAY limits" text box, specify the high and low limit for each dimension.

   Example of a one-dimensional ARRAY:

   ```
   [0..3]
   ```

   Example of a three-dimensional ARRAY:

   ```
   [0..3, 0..15, 0..33]
   ```
7. Confirm your entry.
8. Optional: Change the properties of the tags that are displayed in the other columns of the block interface.

Result

The tag of ARRAY data type is created.

Note

You cannot define specific default values for ARRAY elements. However, you can assign them start values in the instance.

Using tags within the program (Page 717)

Reserved key words (Page 719)

Properties of local tags (Page 890)

Setting the retentivity of local tags (Page 891)

Declaring tags of STRUCT data type

Requirement

The block interface is open.

Procedure

To declare a tag of the STRUCT data type, follow these steps:

1. Select the appropriate declaration section in the interface:
2. Enter a tag name in the "Name" column.
3. Enter "Struct" in the "Data type" column. You will be supported by autocompletion during input.

   An empty, indented row is inserted after the new tag.
4. Insert the first structural element in the first empty row.

   An additional empty row is inserted after the element.
5. Select a data type for the structure element.
6. Optional: Change the properties of the structural element that is displayed in the other columns of the block interface.
7. Repeat the step 4 to 7 for all additional structure elements.

   It is not necessary to end the structure explicitly. The structure ends with the last element that is entered.
8. To insert a new tag after the structure, leave a blank row after the end of the structure and then start the new tag in the second empty row.

Result

The tag of STRUCT data type is created.

See also

Using tags within the program (Page 717)

Reserved key words (Page 719)

Properties of local tags (Page 890)

Setting the retentivity of local tags (Page 891)

Declaring tags based on a PLC data type

Requirement

A PLC data type is declared in the current CPU.

Procedure

To declare a tag based on a PLC data type, follow these steps:

1. Select the appropriate declaration section in the interface:
2. Enter the PLC data type in the "Data type" column. You will be supported by Autocomplete during input.

Result

The tag is created.

Note

You define the default values of tags within a PLC data type when the PLC data type is created. You cannot change these values at the point of use of the PLC data type.

If you change or delete PLC data types that are used in the block interface, the interface becomes inconsistent. To remedy this inconsistency, the interface has to be updated.

See also: Updating the block interface (Page 888)

See also

Basics of PLC data types (Page 1036)

Declaring higher-level tags

Introduction

To access data areas within a declared tag, you can overlay the declared tags with an additional declaration. This provides you with the option of addressing an already declared tag with a different data type. You can, for example, address the individual bits of a tag of WORD data type with an ARRAY of BOOL.

Overlaying tags

To overlay a tag with a new data type, follow these steps:

1. Open the block interface.
2. In the interface, select the tag that you want to overlay with a new data type.
3. Click "Add row" in the toolbar.

   A row is inserted after the tag to be overlaid. The overlaying tag must be declared in the row directly after the tag that is to be overlaid.
4. Enter a tag name in the "Name" column.
5. Enter the "AT" entry in the "Data type" column. You will be supported by Autocomplete in this step.

   The following is added to the entry in the "Name" column.

   ```
   "AT<Name of the higher-level tag>"
   ```
6. Click the data type selection button again and select the data type for the new tag.

   The tag is created. It points to the same data as the higher-level tag, however interprets this data with the new data type.

Removing overlay

To remove the overlay of a tag, follow these steps:

1. Select the overlaid tag that you want to remove.
2. Select the "Delete" command in the shortcut menu.
3. The overlay is removed.

See also

Overlaying tags with AT (Page 731)

Declaring multi-instances

Requirement

- The function block to be called exists in project tree and is multi-instance capable.
- The block interface of the calling function block is open.

Procedure

To declare a function block to be called as a multi-instance, follow these steps:

1. In the "Name" column of the "Static" section, enter a designation for the block call.
2. In the "Data type" column, enter the symbolic name for the function block to be called.

Note

The program editor will declare the multi-instance automatically if you program a block call in a network and then specify in the "Call options" dialog that you want to call the block as a multiple instance.

See also

Updating the block interface (Page 888)

Updating the block interface

Introduction

If you change or delete PLC data types or multiple instances that are used in the block interface, the interface will become inconsistent. To remedy this inconsistency, the interface has to be updated.

You have two options for updating the block interface:

- Explicit updating of the block interface.
  The used PLC data types and multiple instances will be updated. The instance data blocks that belong to the block are not implicitly updated during this process.
- Implicit updating during compilation.
  All used PLC data types and multiple instances as well as the related instance data blocks will be updated.

Explicit updating of the block interface

To explicitly update the block interface, follow these steps:

1. Open the block interface.
2. Select the "Update" command in the shortcut menu.

Implicit Updating during Compilation

Proceed as follows to implicitly update all uses of PLC data types and multiple instances as well as the instance data blocks during compilation:

1. Open the project tree.
2. Select the "Program blocks" folder.
3. Select the command "Compile > Software (rebuild all blocks)" in the shortcut menu.

Properties of local tags

Properties

The following table gives an overview of the properties of local tags:

Group	Property	Description
General	Name	Name of the tags.
	Data type	Data type of the tags.
	Default value	Value with which you pre-assign the tag in the interface of the code block. Specification of the default value is optional. If you do not specify any value the predefined value for the indicated data type is used. For example, the value "false" is predefined for BOOL. The default value will be adopted as the start value in the corresponding instance. You can then replace these adopted values with instance-specific start values. This property is only available in the interface of function blocks.
	Comment	Comment on the tag.
Attributes	Retain	Marks the tag as retentive. The values of retentive tags are retained even after the power supply is switched off. This attribute is only available in the interface of the function block with optimized access.
	Accessible from HMI	Shows whether HMI can access this tag during runtime.
	Visible in HMI	Shows whether the tag is visible by default in the HMI selection list.
	Can be set	Indicates whether a parameter is configurable in CFC.
	For test	Indicates whether a parameter is registered for the CFC test mode.
	Visible	Indicates whether a parameter is visible in CFC.
	Interconnectable	Indicates whether a parameter is interconnectable in CFC.

Setting the retentivity of local tags (Page 891)

Changing properties of local tags (Page 891)

Reserved key words (Page 719)

Setting the retentivity of local tags

Introduction

Function blocks store their data in an instance. To prevent data loss in the event of power failure, you can mark the data as retentive. This data is stored in a retentive memory area. The option of setting the retentivity depends on the set access type of the function block.

Retentive behavior in blocks with standard access

In blocks with standard access you cannot set the retentive behavior of individual tags. You can only define them as retentive in the assigned instance. All tags contained in the block are then considered as retentive.

Retentivity for optimized block access

In data blocks with optimized access you can define the retentive behavior of individual tags.

For structured data type tags, the retentivity setting always applies to the entire structure. You can make no individual retentivity setting for individual elements within the structure.

The following settings are available:

- Retentive

  The values of the tags or the structure are available even after a power failure.
- Non-retentive

  The values of the tags or the structure are lost in the event of a power failure.
- Set in IDB

  The retentivity can be set in the instance data block. The setting that is made in the instance data block than applies, however, centrally to all tags that are selected with "Set in IDB".

Properties of local tags (Page 890)

Basics of block access (Page 700)

Changing properties of local tags

Editing properties in the block interface

To edit the properties of one or more tags, follow these steps:

1. Open the block interface.
2. Change the entries in the columns.

Editing properties in the properties window

To edit the properties of an individual tag, follow these steps:

1. Select a tag in the table.

   The tag properties will be displayed in the Inspector window.
2. Change the entries in the inspector window.

Renaming tags directly in the program editor

To rename one or more tags, follow these steps:

1. Select one or more tags in the program.
2. Select the "Rename tag" command in the shortcut menu.

   The "Rename tag" dialog opens. This dialog box displays a declaration table with the selected tags.
3. Change the entries in the "Name" column.
4. Confirm the input by clicking the "Change" button.

Editing the data type or comment in the program editor

Proceed as follows to edit the data type or tag comment in the program editor:

1. Select the tag name.
2. Select the "Rewire tag" command in the shortcut menu.

   The "Rewire tag" dialog will open. The dialog shows a declaration table.
3. Change the entry in the "Data type" or "Comment" columns.
4. Click the "Change" button to confirm the input.

Effect in the program

In the case of a change of the tag's name, data type or address, each location of use of the tag is automatically updated in the program.

Note

If you change the interface of a block, the program may become inconsistent. The inconsistencies are automatically updated, if possible.

If an automatic updating is not possible, the inconsistent calls are marked in red. You than have to manually updated the inconsistencies.

Editing the block interface

Inserting table rows

Procedure

Proceed as follows to insert a row above the selected row:

1. Select the row in front of which you want to insert a new row.
2. Click the "Insert row" button on the toolbar of the table.

Result

A new row is inserted above the selected row.

Inserting table rows

Procedure

Proceed as follows to insert a row below the selected row:

1. Select the row below which you want to insert a new row.
2. Click the "Add row" button on the table toolbar.

Result

A new empty row will be inserted below the selected row.

Deleting tags

Procedure

To delete a tag, follow these steps:

1. Select the row with the tag to be deleted. You can also select several rows by clicking on them one after the other while holding down the <Ctrl> key or by pressing and holding down <Shift> and clicking on the first and last row.
2. Select the "Delete" command in the shortcut menu.

Automatically filling in successive cells

You can load the contents of one or several table cells into the cells below, automatically filling in the successive cells.

If you automatically fill in cells in the "Name" column, a consecutive number will be appended to each name. For example, "Motor" will become "Motor_1".

You can define individual or more cells as well as entire rows as source area.

If less rows exist in the open table than you want to fill, then you will first have to insert additional empty rows.

Requirement

- The table is open.
- Sufficient declaration rows are available.

Procedure

To automatically fill in successive cells, follow these steps:

1. Select the cells to be loaded.
2. Click the "Fill" symbol in the bottom right corner of the cell.

   The mouse pointer is transformed into a crosshair.
3. Keep the mouse button pressed and drag the mouse pointer downwards over the cells that you want to fill in automatically.
4. Release the mouse button.

   The cells are filled in automatically.
5. If entries are already present in the cells that are to be automatically filled in, a dialog appears. In this dialog you can indicate whether you want to overwrite the existing entries or insert new rows for the new tags.

Show and hide table columns

You can show or hide the columns in a table as needed.

Procedure

To show or hide table columns, follow these steps:

1. Click a column header.
2. In the shortcut menu, select the "Show/hide columns" command.

   The selection of available columns is displayed.
3. To show a column, select the column's check box.
4. To hide a column, clear the column's check box.

Editing tags with external editors

To edit individual tags in external table editors, such as Excel, you can export or import these tags using copy and paste. However, you cannot copy structured tags to an editor.

Requirements

The block interface and an external editor are opened.

Procedure

To export individual tags to an external editor and import them again, follow these steps:

1. Select one or more tags.
2. Select "Copy" in the shortcut menu.
3. Switch to the external editor and paste the copied tags.
4. Edit the tags as required.
5. Copy the tags in the external editor.
6. Select the tags in the external editor.
7. Switch back to the block interface.
8. Select "Paste" in the shortcut menu.

Creating program code

Setting the mnemonics

You can program blocks using German or international mnemonics. If you open the TIA portal for the first the international mnemonics is set as default. You can change the mnemonics at any time.

Procedure

To set the mnemonics, follow these steps:

1. Select the "Settings" command in the "Options" menu.

   The "Settings" window is displayed in the work area.
2. Select the "General" group in the area navigation.
3. In the "General settings" group, select the mnemonics that you want to use.

   The mnemonics is changed in all blocks.

Displaying symbolic and absolute addresses

You have the following options for displaying operands in the program editor:

- Symbolic representation

  The symbolic operands are displayed in the program. The corresponding absolute addresses are shown in tooltips if you hold the mouse pointer over the operand.
- Absolute representation

  The absolute addresses are displayed in the program. The corresponding symbolic operands are displayed in tooltips.
- Symbolic and absolute representation

  Symbolic operands and absolute addresses are displayed in program.

Requirement

The program editor is open.

Procedure

To change the representation of the operands, follow these steps:

1. Click the "Absolute/symbolic operands" button in the program editor toolbar.

   Each time you click the button, the representation and the symbol on the button change.

Or:

1. Click the small arrow next to the "Absolute/symbolic operands" button in the program editor toolbar.

   A drop-down list is displayed.
2. Select the required representation from the drop-down list.

   The symbol on the button changes.

Basic information about operands (Page 716)

Use instruction versions

Basic information on instruction versions

The instructions available to you for programming the user program are managed in system libraries. If a new version of a system library is installed by an update, the newer versions of the instructions of this system library may also be installed.

If there are several versions for an instruction, these are listed in the "Instructions" task card after the respective instruction. If the instruction versions are not shown, you can show them via the "Show column headers and additional columns" button in the toolbar of the "Instructions" task card. You can then select the versions of the instructions to be used in the program from the dropdown-list box of the "Version" column. If you do not select any versions, the most recent versions are used.

Note

Please note the following:

- You can only ever use the same version of an instruction within a device.
- If you change the version of an instruction that other instructions depend on, the versions of the dependent instructions are also changed.
- If you select a version for an instruction that can not be run on the CPU used, the instruction is shaded out. This means that you cannot use this instruction in this version with your CPU.

Changes in the versions

New versions can be main versions or secondary versions. New versions, such as 2.0 or 3.0, have more substantial changes to them. New main versions may therefore result in changes to the block interface. New secondary versions, such as 1.3 or 1.4, contain lesser changes or remedies to errors.

Using instruction versions

You can decide within a device which version of an instruction you want to use. If you select another version for an instruction, the new version is specified for all locations of use of this instruction within your program. These instructions are identified in the program by a red frame. You must then download your program to the device to use the new instruction version.

Creating LAD programs

Basic information on LAD

LAD programming language

Overview of the Ladder Logic (LAD) programming language

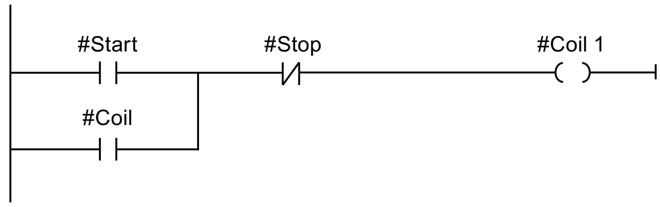
LAD is a graphical programming language. The representation is based on circuit diagrams.

The program is mapped in one or more networks. A network contains a power rail on the left where the rungs originate. The binary signal scans are arranged in the form of contacts on the rungs. The serial arrangement of the elements on a rung creates a series connection; arrangement on simultaneous branches creates a parallel connection. Complex functions are represented by boxes.

Example of networks in LAD

The following figure shows an LAD network with normally open contacts, normally closed contacts and a coil:

Network 1



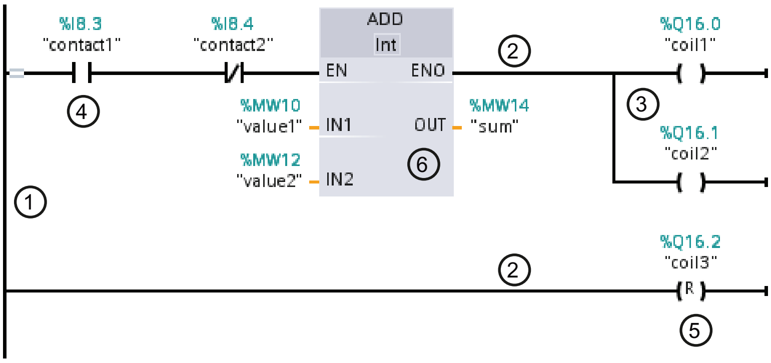
Overview of the LAD elements

LAD elements

A LAD program consists of separate elements that you can arrange in series or parallel on the power rail of a network. Most program elements must be supplied with tags.

There is at least one rung from the power rail. Network programming starts at the left edge of the rung. You can expand the power rail by several rungs and branches.

For example, the following figure shows elements of a LAD network:



1) Power rail

2) Rung

3) Branch

4) Contact

5) Coil

6) Box

Power rail

Each LAD network consists of a power rail that contains at least one rung. A network can be extended by adding additional rungs. You can use branches to program parallel connections in the specific rungs.

Contacts

You can use contacts to create or interrupt a current-carrying connection between two elements. The current is relayed from left to right. You can use contacts to query the signal state or the value of an operand and control it depending on the result of the current flow.

The following types of contact are available to you in a LAD program:

- Normally open contact:
  Normally open contacts forward the current if the signal state of a specified binary operand is "1".
- Normally closed contacts:
  Normally open contacts forward the current if the signal state of a specified binary operand is "0".
- Contact with additional function:
  Contacts with additional function forward the current if a specific condition is met. With these contacts you can also execute an additional function, such as an RLO edge detection and a comparison.

Coils

You can use coils to control binary operands. Coils can set or reset a binary operand depending on the signal state of the result of logic operation.

The following types of coils are available to you in a LAD program:

- Standard coils:
  Standard coils set a binary operand if current flows in the coil. The "Assignment" instruction is an example of a standard coil.
- Coils with additional function:
  These coils have additional functions besides the evaluation of the result of logic operation. Coils for RLO edge detection and program control are examples of coils with additional function.

Boxes

Boxes are LAD elements with complex functions. The empty box is an exception. You can use the empty box as a placeholder in which you can select the required instruction.

The following types of boxes are available to you in a LAD program:

- Boxes without EN/ENO mechanism:
  A box is executed depending on the signal state at the box inputs. The error status of the processing cannot be queried.
- Boxes with EN/ENO mechanism:
  A box is only executed if the enabling input "EN" carries the signal state "1". If the box is processed correctly, the "ENO" enable output has signal state "1". If an error occurs during the processing, the "ENO" output is reset.

Calls of code block are also shown in the network as boxes with EN/ENO mechanism.

See also

Rules for the use of LAD elements (Page 908)

Settings for LAD

Overview of the settings for LAD

Overview

The following table shows the settings that you can make:

Group	Setting	Description
Font	Size	Font size in program editor
View	Layout	Compact or wide Changes the vertical spacing between operands and other objects (such as operand and contact). The change becomes visible once the block is reopened.
	With absolute information	Additional display of the absolute addresses
Operand field	Maximum width	Maximum number of characters that can be entered horizontally in the operand field. This setting recalculates the layout of the networks.
	Maximum height	Maximum number of characters that can be entered vertically in the operand field. This setting recalculates the layout of the networks.

See also

Changing the settings (Page 901)

Changing the settings

Procedure

To change the settings, follow these steps:

1. Select the "Settings" command in the "Options" menu.

   The "Settings" window is displayed in the work area.
2. In the area navigation, select the "PLC programming" group.
3. Change the settings.

Result

The change will be loaded directly, there is no need to save it explicitly.

See also

Overview of the settings for LAD (Page 901)

Working with networks

Using networks

Function

The user program is created in the block within networks. For a code block to be programmed, it must contain at least one network. To achieve a better overview of the user program, you can also subdivide your program into several networks.

See also

Entering the network title (Page 906)

Entering a network comment (Page 906)

Navigating networks (Page 907)

Inserting networks

Requirement

A block is open.

Procedure

To insert a new network, follow these steps:

1. Select the network after which you want to insert a new network.
2. Select the "Insert network" command in the shortcut menu.

Result

A new empty network is inserted into the block.

Navigating networks (Page 907)

Selecting networks

Requirements

A network is available.

Selecting a network

To select a network, follow these steps:

1. Click the title bar of the network that you want to select.

Selecting several networks

Proceed as follows to select several individual networks:

1. Press and hold down the <Ctrl> key.
2. Click all the networks that you want to select.

To select several successive networks, follow these steps:

1. Press and hold down the <Shift> key.
2. Click the first network that you want to select.
3. Click the last network that you want to select.

   The first and last networks and all those in between are selected.

Navigating networks (Page 907)

Copying and pasting networks

Copied networks can be pasted within the block or in another block. If the network is pasted into a block written in a different programming language, the programming language of the network is retained.

Requirements

A network is available.

Procedure

To copy and paste a network, follow these steps:

1. Select the network or networks to be copied.
2. Select "Copy" in the shortcut menu.
3. Select the network after which you want to paste in the copied network.
4. Select "Paste" in the shortcut menu.

Entering a network comment (Page 906)

Navigating networks (Page 907)

Entering a network comment

You can use network comments to provide comments on the program contents of individual networks. For example, you can indicate the function of the network or draw attention to special characteristics.

Requirement

A network is available.

Procedure

To enter a network comment, follow these steps:

1. Click on the right arrow before the network title.
2. If the comment area is not visible, click "Network comments on/off" in the toolbar.

   The comment area is displayed.
3. Click "Comment" in the comment area.

   The "Comment" text passage is selected.
4. Enter the network comment.

Navigating networks (Page 907)

Navigating networks

You can navigate straight to a specific position within a block.

Procedure

To navigate to a specific position within a block, follow these steps:

1. Right-click on the white area of the programming window.
2. Select the "Go to > Network/line" command in the shortcut menu.

   The "Go to" dialog will open.
3. Enter the network to which you want to navigate.
4. Enter the line number of the network to which you want to navigate.
5. Confirm your entry with "OK".

Result

The relevant line will be displayed if this is possible. If the network or line requested does not exist, the last existing network or the last existing line in the network requested will be displayed.

Inserting LAD elements

Rules for the use of LAD elements

Rules

Note the following rules when inserting LAD elements:

- Every LAD network must terminate with a coil or a box. However, the following LAD elements must not be used to terminate a network:
  - Comparator boxes
  - Instructions for positive and negative RLO edge detection
- The starting point of the branch for a box connection must always be the power rail. Logic operations or other boxes can be present in the branch before the box.
- Only contacts can be inserted into simultaneous branches with preceding logic operations. The contact for negating the result of logic operation (-|NOT|-) is an exception here. The contact for negating the result of logic operation, as well as coils and boxes, can be used in simultaneous branches if they originate directly from the power rail.
- Constants (e.g. TRUE or FALSE) cannot be assigned to normally open or normally closed contacts. Instead, use the operands of the BOOL data type.
- Only one jump instruction can be inserted in each network.
- Only one jump label can be inserted in each network.
- Instructions with positive or negative edge detection may not be arranged directly at the left margin of the rung as they requires a prior logic operation.

Placement rules for S7-1200 CPUs

The following table sets out the instructions that can only be positioned at the end of the network:

Instruction		Prior logic operation required
Mnemonics	Name	
SET_BF	Set bit field	No
RESET_BF	Reset bit field	No
TP	Start pulse timer	Yes
TON	Start on-delay timer	Yes
TOF	Start off-delay timer	Yes
TONR	Time accumulator	Yes
JMP	Jump if RLO=1	No
JMPN	Jump if RLO=0	Yes
JMP_LIST	Define jump list	No
SWITCH	Jump distributor	No
RET	Return	No

Placement rules for S7-300/400 CPUs

The following table sets out the instructions that can only be positioned at the end of the network:

Instruction		Prior logic operation required
Mnemonics	Name	
S	Set output	Yes
R	Reset output	Yes
SP	Start pulse timer	Yes
SE	Start extended pulse timer	Yes
SD	Start on-delay timer	Yes
SS	Start retentive on-delay timer	Yes
SF	Start off-delay timer	Yes
SC	Set counter value	Yes
CU	Count up	Yes
CD	Count down	Yes
JMP	Jump if RLO=1	No
JMPN	Jump if RLO=0	Yes
RET	Return	No
OPN	Open global data block	No
OPNI	Open instance data block	No
CALL	Call block	No

Instruction		Prior logic operation required
Mnemonics	Name	
SAVE	Save RLO in BR bit	No
MCRA	Enable MCR range	No
MCRD	Disable MCR range	No
MCR<	Open MCR ranges	No
MCR>	Close MCR ranges	No

See also

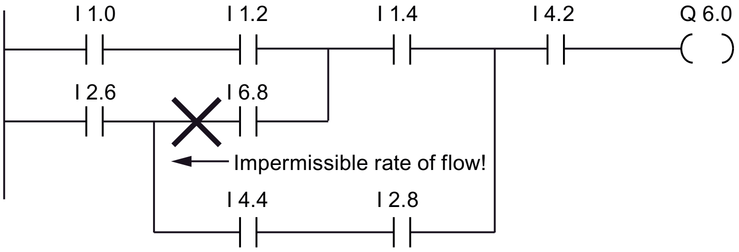
Prohibited interconnections in LAD (Page 910)

Overview of the LAD elements (Page 899)

Prohibited interconnections in LAD

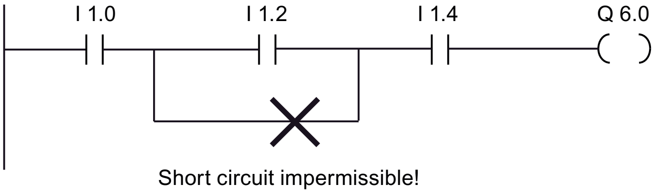
Power flow from right to left

No branches can be programmed that could result in a power flow in the reverse direction.



Short-circuit

No branches may be programmed that would cause a short-circuit.



Logic operations

The following rules apply to logic operations:

- Only Boolean inputs can be combined with preceding logic operations.
- Only the first Boolean output can be combined with a further logic operation.
- Only one complete logical path can exist per network. Paths that are not connected can be linked.

See also

Rules for the use of LAD elements (Page 908)

Inserting LAD elements using the "Instructions" task card

Requirement

A network is available.

Procedure

To insert a LAD element into a network using the "Instructions" task card, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to the LAD element that you want to insert.
3. Use drag-and-drop to move the element to the desired place in the network.

   If the element is an internal system function block (FB), the "Call option" dialog opens. In this dialog you can create an instance data block of the single-instance or multiple-instance type for the function block in which the data of the inserted element will be saved. You will find the new instance data block created in the project tree in the "Program resources" folder under "Program blocks > System blocks". If you have selected "multi-instance", these are located in the block interface in the "Static" section.

Or:

1. Select the point in the network at which you want to insert the element.
2. Open the "Instructions" task card.
3. Double-click on the element you want to insert.

   If the element is an internal system function block (FB), the "Call option" dialog opens. In this dialog you can create an instance data block of the single-instance or multiple-instance type for the function block in which the data of the inserted element will be saved. You will find the new instance data block created in the project tree in the "Program resources" folder under "Program blocks > System blocks". If you have selected "multi-instance", these are located in the block interface in the "Static" section.

Result

The selected LAD element is inserted with placeholders for the parameters.

Inserting LAD elements using an empty box

Requirement

A network is available.

Procedure

To insert an LAD element into a network using an empty box, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "General > Empty box" in the "Basic instructions" palette.
3. Use a drag-and-drop operation to move the "Empty box" element to the desired place in the network.
4. Position the cursor over the triangle in the top right-hand corner of the empty box.

   A drop-down list is displayed.
5. Select the required LAD element from the drop-down list.

   If the element is an internal system function block (FB), the "Call option" dialog opens. In this dialog you can create an instance data block of the single-instance or multiple-instance type for the function block in which the data of the inserted element will be saved. You will find the new instance data block created in the project tree in the "Program resources" folder under "Program blocks > System blocks". If you have selected "multi-instance", these are located in the block interface in the "Static" section.

Result

The empty box is changed to the respective LAD element. Placeholders are inserted for the parameters.

Selecting the data type of a LAD element

Selecting a data type

Introduction

Some instructions can be executed with several different data types. If one of these instructions is used in the program, a valid data type must be specified for the instruction at the specific point in the program. Data types for the inputs and outputs must be explicitly selected for some instructions.

Note

The valid data type (BOOL) for the tags on the enable input ENO and the enable output ENO is predefined by the system and cannot be changed.

The valid data types for an instruction are listed in the instruction drop-down list. You specify the data type of the instruction by selecting an entry from the drop-down list. If the data type of a specified tag differs from the data type of the instruction, the tag name will be displayed in red and a rollout with the corresponding error message will appear.

See also

Defining the data type of an instruction (Page 913)

Defining the data type of an instruction

Introduction

Some instructions can be executed with several different data types. If such instructions are to be inserted in the program, a data type for their execution must be defined at the specific point in the program in question.

Specifying the data type by means of the drop-down list

To define the data type of an instruction using the drop-down list, follow these steps:

1. Insert the instruction at the required point in the program using drag-and-drop.

   The instruction will be inserted at the selected point in the program. The entry "???" (undefined) is displayed in the drop-down list.

2. Click the yellow triangle in the upper corner of the drop-down list.

   The drop-down list will open to display the data types valid for the instruction.

3. Select a data type from the drop-down list.

   The selected data type is displayed.

4. If the instruction has two drop-down lists, select the data type for the instruction inputs in the left-hand drop-down list and the data type for the instruction outputs in the right-hand drop-down list.

Specifying data type by assigning tags

To define the data type of an instruction by assigning tags, follow these steps:

1. Insert the instruction at the required point in the program using drag-and-drop.

   The instruction will be inserted at the selected point in the program. The entry "???" (undefined) is displayed in the drop-down list.

2. At an input or output, specify a valid tag, the data type of which is to be applied as the instruction data type.

   The selected data type is displayed in the drop-down list.

3. Enter a valid tag at an input and a valid tag at an output if data types are to be defined for the instruction inputs and outputs. The tag specified at the input determines the data type of the inputs; the tag specified at the output determines the data type of the outputs of the instruction.

Using favorites in LAD

Adding LAD elements to Favorites

Requirement

- A block is open.
- The multipane mode is set for the "Instructions" task card or the Favorites are also displayed in the editor.

Procedure

To add SCL instructions to the Favorites, follow these steps:

1. Open the "Instructions" task card.
2. Maximize the "Basic instructions" pane.
3. Navigate in the "Basic instructions" pane to the instruction that you want to add to the Favorites.
4. Drag-and-drop the instruction into the "Favorites" pane or into the Favorites area in the program editor.

Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

See also

Removing LAD elements from Favorites (Page 916)

Overview of the program editor (Page 863)

Inserting LAD elements using favorites

Requirement

- A block is open.
- Favorites are available.

Procedure

To insert an instruction into a program using Favorites, follow these steps:

1. Drag-and-drop the desired instruction from Favorites to the desired position.

Or:

1. Select the position in the program where you want to insert the instruction.
2. In the Favorites, click on the instruction you want to insert.

Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

Insert block calls in LAD

Inserting block calls using a drag-and-drop operation

You can insert calls for existing functions (FC) and function blocks (FB) using a drag-and-drop operation from the project tree. If you call function blocks from other function blocks, you can either call them as single-instance or multi-instance blocks. If a function block is called as single instance, it will store its data in a data block of its own. If a function block is called as multi-instance, it will store its data in the instance data block of the calling function block.

Requirement

- A network is available.
- The block that is to be called is available.

Inserting a call of a function (FC)

To insert a call of a function (FC) into a network using a drag-and-drop operation, follow these steps:

1. Drag the function from the project tree to the required network.

Inserting a call for a function block (FB)

To insert a call for a function block (FB), follow these steps:

1. Drag the function block from the project tree to the required network.

   The "Call options" dialog opens.
2. Enter in the dialog whether you wish to call the block as single or multi-instance.
   – If you click on the "Single instance" button, you will have to enter a name in the "Name" text box for the data block that you want to assign to the function block.
   – If you click on the "Multi-instance" button, you will have to enter the name of the tag in the "Name in the interface" text box; this is the name that you use to enter the called function block as a static tag in the interface of the calling block.
3. Confirm your entries with "OK".

Result

The function or the function block is inserted with its parameters. You can then assign the parameters.

See also: Parameter transfer at block call (Page 707)

Note

If when calling a function block you specify an instance data block that does not exist, it will be created. If you have called a function block as a multi-instance, this will be entered as a static tag in the interface.

Updating block calls in LAD (Page 918)

Correcting the call type (Page 919)

Single instances (Page 704)

Multi-instances (Page 706)

Updating block calls in LAD

If interface parameters of a called block are changed, the block call can no longer be executed correctly. You can avoid such inconsistent block calls by updating the block calls.

You have two options to update the block calls:

- Explicit updating in the program editor.

  The block calls in the open block will be updated.
- Implicit updating during compilation.

  All block calls in the program as well as the used PLC data types will be updated.

Update blocks in the program editor

To update a block call within a block, follow these steps:

1. Open the block in the program editor.
2. Click "Update inconsistent block calls" in the toolbar.

Or:

1. Open the block in the program editor.
2. Right-click on the instruction with the block call.
3. Select the "Update" command in the shortcut menu.

   The "Interface update" dialog opens. This dialog shows the differences between the block interface in use and the changed interface of the called block.
4. If you want to update the block call, click "OK". To cancel the update, click "Cancel".

Update block calls during compilation

Follow these steps to update all block calls and uses of PLC data types during compilation implicitly:

1. Open the project tree.
2. Select the "Program blocks" folder.
3. Select the command "Compile > Software (rebuild all blocks)" in the shortcut menu.

See also

Inserting block calls using a drag-and-drop operation (Page 917)

Correcting the call type (Page 919)

Correcting the call type

Call type

There are two ways of calling function blocks:

- As a single instance
- As a multi-instance

See also: Call function blocks as single or multi-instances (Page 704)

You can modify a defined call type at any time.

Requirement

The user program contains a block call.

Procedure

To change the call type of a function block, follow these steps:

1. Open the code block and select the block call.
2. Select the "Change call type" command in the shortcut menu.

   The "Call options" dialog opens.
3. Click the "Single instance" or "Multi instance" button.
   – If you select the "Single instance" call type, enter a name for the data block that will be assigned to the function block.
   – If you select "Multi-instance" as the call type, enter the name of the tag in the "Name in the interface" text block with which the called function block will be entered as a static tag in the interface of the calling block.
4. Confirm your entries with "OK".

Note

The previous single and multiple instances will not be deleted automatically.

Parameter transfer at block call (Page 707)

Inserting complex LAD instructions

Using the "Calculate" instruction

Requirement

A network is available.

Procedure

Proceed as follows to use the "Calculate" instruction:

1. Open the "Instructions" task card.
2. Navigate to "Math functions > CALCULATE" in the "Basic instructions" pane.
3. Use drag-and-drop to move the element to the desired place in the network.

   The instruction "Calculate" will be inserted for the data type with a placeholder expression and question mark.
4. Enter the data type for the calculation.

5. Enter the operands for the calculation.

   Note

   The calculation is run with the inputs of the "Calculate" instruction. If you want to use constants you must also insert appropriate inputs for them.

6. Click on the "Edit 'Calculate' instruction" button to replace the placeholder expression with the correct expression.

   The "Edit 'Calculate' instruction" dialog will open.

7. Enter the required expression in the "OUT:= " text box.

   Note

   In the "Example" area you can find an example of a valid expression and possible instructions that you can use.

   To determine a value with the help of Pythagoras' theorem, for example, enter "OUT := SQRT (SQR (IN1) + SQR (IN2))".

8. Confirm your entry with "OK".

Using free-form comments

Basic information on using free-form comments in LAD

Introduction

Free-form comments allow you to add comments to the source code for graphic programming languages similar to line comments for textual languages.

Free-form comments can be used for the following elements:

- Boxes
- Coils

See also

Inserting free-form comments (Page 922)

Editing free-form comments (Page 922)

Deleting free-form comments (Page 923)

Inserting free-form comments

Requirement

A network with instructions is available.

Procedure

To insert a free-form comment, proceed as follows:

1. Right-click on the instruction for which you want to insert a free-form comment.
2. Select the "Insert comment" command in the shortcut menu.

   A comment box with a standard comment opens. The comment box is connected by an arrow to the corresponding instruction.
3. Enter the required comment in the comment box.

See also

Basic information on using free-form comments in LAD (Page 921)

Editing free-form comments (Page 922)

Deleting free-form comments (Page 923)

Editing free-form comments

Introduction

Free-form comments can be edited as follows:

- Changing the comment text
- Changing the position and size of the comment box
- Attaching a comment to another element
- Showing and hiding free comments

Changing the comment text

To change the text of free-form comments, follow these steps:

1. Click on the comment box.
2. Enter the desired text.

Changing the position of the comment box

To change the positioning of the comment box, follow the steps below:

1. Left-click the comment box and keep the mouse button pressed.
2. Drag the comment box to the desired location.

Changing the size of the comment box

To change the size of the comment box, follow the steps below:

1. Click on the comment box.
2. Drag the comment box on the move handle in the lower right corner to the desired size.

Attaching a comment to another element

To attach a free-form comment to another element, follow these steps:

1. Left-click the point of the arrow that links the comment box with the instruction and keep the mouse button pressed.
2. Drag the arrow to the element to which you want to attach the comment. Possible insertion points are marked with a green square.
3. Release the mouse button.

Showing and hiding free comments

To show or hide a free-form comments, follow these steps:

1. Click the "Free-form comment on/off" button in the toolbar.

See also

Basic information on using free-form comments in LAD (Page 921)

Inserting free-form comments (Page 922)

Deleting free-form comments (Page 923)

Deleting free-form comments

Procedure

To delete a free-form comment, proceed as follows:

1. Right-click on the free-form comment that you want to delete.
2. Select the "Delete" command in the shortcut menu.

See also

Basic information on using free-form comments in LAD (Page 921)

Inserting free-form comments (Page 922)

Editing free-form comments (Page 922)

Editing LAD elements

Selecting LAD elements

You can select several individual elements or all elements in a network.

Requirement

LAD elements are available

Selecting several individual LAD elements

To select several individual LAD elements, follow these steps:

1. Press and hold down the <Ctrl> key.
2. Click on all the LAD elements you wish to select.
3. Now release the <Ctrl> key.

Selecting all LAD elements in a network

To select all LAD elements in a network, follow these steps:

1. Place the cursor in the network whose elements you wish to select.
2. Select the "Select all" in the "Edit" menu or press <Ctrl A>.

See also

Copying LAD elements (Page 925)

Replacing LAD elements (Page 926)

Inserting additional inputs and outputs in LAD elements (Page 927)

Removing inputs and outputs (Page 928)

Deleting LAD elements (Page 929)

Copying LAD elements

Requirement

An LAD element is available.

Procedure

To copy a LAD element, follow these steps:

1. Right-click the LAD element that you want to copy.
2. Select "Copy" in the shortcut menu.

Result

The LAD element will be copied and saved to the clipboard.

See also

Selecting LAD elements (Page 924)

Inserting additional inputs and outputs in LAD elements (Page 927)

Removing inputs and outputs (Page 928)

Deleting LAD elements (Page 929)

Cutting LAD elements

Requirement

An LAD element is available.

Cutting

To cut a LAD element, follow these steps:

1. Right-click the LAD element that you want to cut.
2. Select "Cut" in the shortcut menu.

Result

The LAD element will be cut and saved to the clipboard.

See also

Selecting LAD elements (Page 924)

Copying LAD elements (Page 925)

Pasting an LAD element from the clipboard (Page 926)

Replacing LAD elements (Page 926)

Removing inputs and outputs (Page 928)

Deleting LAD elements (Page 929)

Pasting an LAD element from the clipboard

Requirement

An LAD element is available.

Procedure

To paste an LAD element from the clipboard, follow these steps:

1. Copy a LAD element or cut a LAD element.
2. Right-click the point in the network where you want to paste the element.
3. Select "Paste" in the shortcut menu.

Removing inputs and outputs (Page 928)

Deleting LAD elements (Page 929)

Replacing LAD elements

You can easily exchange LAD elements with other LAD elements of the same type. This has the advantage that the parameters are retained and need not be entered again. For example, you can exchange normally open contacts and normally closed contacts or RS FlipFlop and SR FlipFlop.

Requirements

A network with at least one LAD element is present.

Procedure

To replace an LAD element with another LAD element, follow these steps:

1. Select the LAD element that you want to replace.
2. Position the cursor over the triangle in the top right-hand corner of the LAD element.

   A drop-down list is displayed.
3. From the drop-down list, select the LAD element that you want to use to replace the existing LAD element.

Inserting additional inputs and outputs in LAD elements (Page 927)

Removing inputs and outputs (Page 928)

Deleting LAD elements (Page 929)

Inserting additional inputs and outputs in LAD elements

Introduction

You can expand LAD elements which execute commutative arithmetic instructions by adding additional inputs. Such elements are, for example, the instructions "Add" (ADD) and "Multiply" (MUL). You can expand the MOVE and DEMUX instruction boxes by adding additional outputs.

Requirement

An LAD element is available that permits the insertion of additional inputs and outputs.

Inserting an additional input

To add an additional input to the box of a LAD element, follow these steps:

1. Right-click on an existing input of the LAD element.
2. Select "Insert input" in the shortcut menu.

   An additional input is added to the box of the LAD element.

Or:

1. Click on the yellow star symbol beside the last input in the instruction box.

   An additional input is added to the box of the LAD element.

Inserting an additional output

To add an additional output to the box of a LAD element, follow these steps:

1. Right-click on an existing output of the LAD element.
2. Select "Insert output" from the shortcut menu.

   An additional output is added to the box of the LAD element.

Or:

1. Click on the yellow star symbol beside the last input in the instruction box.

   An additional output is added to the box of the LAD element.

Deleting LAD elements (Page 929)

Removing inputs and outputs

Introduction

Inputs and outputs which you have added to an instruction can be removed.

Requirement

An LAD element is available to which you have added additional inputs and outputs.

Remove input

To remove an input, follow these steps:

1. Select the input that you want to remove.
2. Select the "Delete" command in the shortcut menu.

   The input of the LAD element is removed.

Remove output

To remove an output, follow these steps:

1. Select the output that you want to remove.
2. Select the "Delete" command in the shortcut menu.

   The output of the LAD element will be removed.

Deleting LAD elements (Page 929)

Deleting LAD elements

Requirement

An LAD element is available.

Procedure

To delete a LAD element, follow these steps:

1. Right-click the LAD element that you want to delete.
2. Select the "Delete" command in the shortcut menu.

See also

Selecting LAD elements (Page 924)

Copying LAD elements (Page 925)

Cutting LAD elements (Page 925)

Pasting an LAD element from the clipboard (Page 926)

Replacing LAD elements (Page 926)

Inserting additional inputs and outputs in LAD elements (Page 927)

Removing inputs and outputs (Page 928)

Inserting operands into LAD instructions

Inserting operands

The character strings "<???>", "<??.?>" and "..." are inserted as placeholders for the parameters when an LAD element is inserted. The "<???>" and "<??.?>" strings displayed in red indicate parameters that need to be connected. The "..." string displayed in black indicates parameters that may be connected. "<??.?>" stands for Boolean placeholders.

Note

If you position the cursor over the placeholder, the expected data type will be displayed.

Requirement

An LAD element is available.

Procedure

To connect the parameters of a LAD element, follow these steps:

1. Double-click the placeholder of the parameter.

   An entry field opens, and the placeholder is selected.
2. Enter the appropriate parameter.

   Note

   If you enter the absolute address of a parameter that has already been defined, this absolute address will be changed to the symbolic name of the parameter as soon as the input is confirmed. If you have not yet defined the parameter, a new tag with this absolute address and the default name "Tag_<n>" will be entered in the PLC tag table. When you confirm your input, the absolute address will be replaced with the symbolic name "Tag_<n>".

3. Confirm the parameter with the Enter key.
4. If you have not yet defined the parameter, you can define it directly in the program editor using the shortcut menu.

   See also:

   Declaring PLC tags in the program editor (Page 832)

   Declaring local tags in the program editor (Page 882)

Or drag from it the PLC tag table:

1. In the project tree, select the "PLC tags" folder or open the PLC tag table.
2. If you have opened the PLC tag table, drag the symbol from the first column of the desired tag to the appropriate place in your program. If you have not opened the PLC tag table yet, open the detail view now. Drag the desired tag from the detail view to the appropriate place in your program.

Or drag from it the block interface:

1. Open the block interface.
2. Drag the required operand from the block interface to the instruction window.

Result

- If the syntax is error-free, the displayed parameter is black. The editor then jumps to the next placeholder.
- If there is an error in the syntax, the cursor stays in the entry field and a corresponding error message is displayed in the status line. If you press the Enter key again, the entry field is closed and the faulty entry is displayed in red italics.

Wiring hidden parameters

Introduction

Depending on the CPU used, you can use complex instructions in your program that are dispatched with the TIA portal. These instructions can contain parameters that are declared as hidden.

If an instruction contains hidden parameters, the instruction box has a small arrow on the lower edge. You can recognize hidden parameters by their white font.

You can show and wire the hidden parameters at any time.

Showing or hiding hidden parameters

To show or hide hidden parameters, follow these steps:

1. Click on the down arrow at the bottom edge of the instruction box to show hidden parameters.
2. Click on the up arrow at the bottom edge of the instruction box to hide hidden parameters.

Wiring hidden parameters

To wire parameters, follow these steps:

1. Wire the hidden parameters like normally visible parameters.

   The hidden parameter is transformed into a visible parameter.

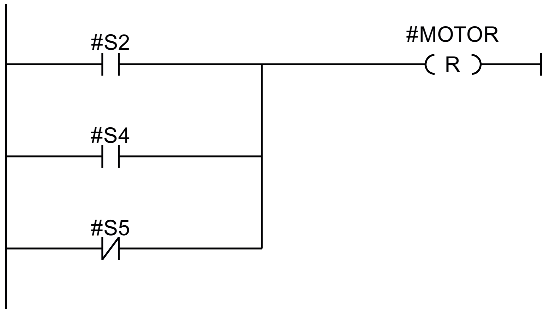
Branches in LAD

Basic information on branches in LAD

Definition

You use branches to program parallel circuits with the Ladder Logic (LAD) programming language. Branches are inserted in the main rung. You can insert several contacts into the branch and thus achieve a parallel circuit of series connections. This allows you to program complex ladder logic.

The figure below shows an example of the use of branches:



MOTOR carries signal 1, if one of the following conditions is fulfilled:

- Signal 1 is pending on S2 or S4
- Signal 0 is pending on S5.

See also

Rules for branches in LAD (Page 933)

Inserting branches into the LAD network (Page 933)

Closing branches in the LAD network (Page 934)

Deleting branches in LAD networks (Page 935)

Rules for branches in LAD

Rules

The following rules apply to simultaneous branches:

- A simultaneous branch can only be inserted if the main branch already contains an LAD element.
- Simultaneous branches are opened downwards or are connected directly to the power rail. They are terminated upwards.
- Simultaneous branches are opened after the selected LAD element.
- Simultaneous branches are terminated after the selected LAD element.
- To delete a simultaneous branch, you must delete all LAD elements of this branch. When the last LAD element is removed from the branch, the rest of the branch is also removed.

See also

Basic information on branches in LAD (Page 932)

Inserting branches into the LAD network (Page 933)

Deleting branches in LAD networks (Page 935)

Closing branches in the LAD network (Page 934)

Inserting branches into the LAD network

You can create several branches in a network.

Requirement

- A network is available.
- The network contains elements.

Procedure

To insert a new branch in a network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "General > Open branches" in the "Simple instructions" palette.
3. Use drag-and-drop to move the element to the desired place in the network.

   If you want to connect the new branch directly to the power rail, drag the element to the power rail.

See also

Basic information on branches in LAD (Page 932)

Rules for branches in LAD (Page 933)

Deleting branches in LAD networks (Page 935)

Closing branches in the LAD network

Branches must be closed again at suitable places. If necessary, branches will be arranged so that they do not cross each other.

Requirement

A branch is available.

Procedure

To close an open branch, follow these steps:

1. Select the open branch.
2. Press and hold down the left mouse button.

   A dashed line will appear as soon as the cursor is moved.
3. Drag the dashed line to a suitable place on the network. Permissible connections are indicated by green lines.
4. Release the left mouse button.

See also

Basic information on branches in LAD (Page 932)

Rules for branches in LAD (Page 933)

Deleting branches in LAD networks

Requirement

A branch is available.

Procedure

To delete a branch, follow these steps:

1. Select the connection line that links the branch to the main branch.
2. Select the "Delete" command in the shortcut menu.

Rules for branches in LAD (Page 933)

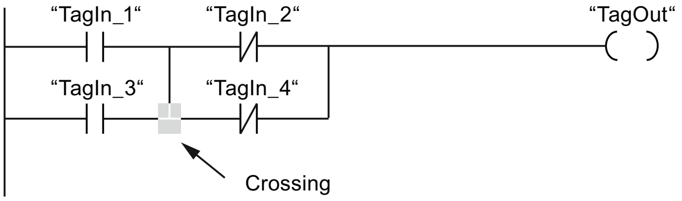
Inserting branches into the LAD network (Page 933)

Crossings in LAD

Basic information on crossings in LAD

Definition

A crossing is a place in a LAD network where one branch is closed and at the same time another branch is opened.



"TagOut" receives signal 1, if the following two conditions are met:

- "TagIn_1" or "TagIn_3" has signal 1
- "TagIn_2" or "TagIn_4" has signal 0

Inserting crossings

You can insert crossings in a LAD network by creating connections between the main branch and an additional branch or between different branches.

Requirements

A branch is available.

Procedure

To insert a new crossing in an LAD network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "General > Open branches" in the "Simple instructions" palette.
3. Drag the element behind the existing branch.
4. Insert any element into the open branch.
5. Click the arrow of the open branch after the inserted element.
6. Hold down the left mouse button and drag the dashed connecting line to the main branch.
7. Release the left mouse button.

See also

Rearranging crossings (Page 936)

Deleting crossings (Page 937)

Inserting branches into the LAD network (Page 933)

Rearranging crossings

Requirement

A crossing is available.

Procedure

To rearrange a connection, follow these steps:

1. Select the connection line that defines the crossings in the respective branches.
2. Select the "Delete" command in the shortcut menu.
3. Open the "Instructions" task card.
4. Navigate to "General > Open branches" in the "Simple instructions" palette.
5. Use a drag-and-drop operation to move the element to the place in the network where you want to insert the new crossing.
6. Click on the arrow for the open branch.
7. Hold down the left mouse button and drag the dashed connecting line to the subsidiary branch in which you wish to insert the new crossing.
8. Release the left mouse button.

Inserting crossings (Page 935)

Rearranging crossings (Page 936)

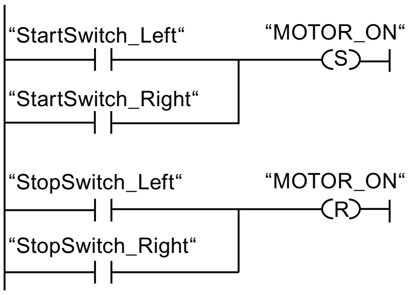
Rungs in LAD

Basic information on rungs in LAD

Using rungs

The program is mapped in one or more networks. A network contains a power rail on the left where one or more rungs originate. The binary signal scans are arranged in the form of contacts on the rungs. The serial arrangement of the elements on a rung creates a series connection; arrangement on simultaneous branches creates a parallel connection. A rung is closed by a coil or a box in which the result of logic operation will be written.

The figure below shows an example of the use of several rungs within a network:



Rules

Remember the following rules when using several rungs:

- Connections are not permitted between rungs.
- Only one jump instruction is permissible per network. The positioning rules for jump instructions remain valid.

Running rungs

Rungs and networks are executed from top to bottom and from left to right. This means that the first instruction in the first rung of the first network is processed first. All instructions of this rung are then processed. After this come all other rungs of the first network. The next network is processed only after all rungs have first been run.

Differences between branches and rungs

The difference between branches and rungs is that the rungs are independent branches that can also stand in a different network. Branches, on the other hand, permit the programming of a parallel connection.

See also

Insert rung (Page 938)

Deleting a rung (Page 939)

Insert rung

Requirement

- A block is open.
- A network is available.

Procedure

To insert a new rung in a network, proceed as follows:

1. Insert any coil on the power rail.

   A new rung will be inserted and the coil positioned at the end of the rung.
2. Insert additional instructions in the new rung.

See also

Basic information on rungs in LAD (Page 937)

Deleting a rung (Page 939)

Deleting a rung

Requirement

A rung is available.

Procedure

To delete a rung, proceed as follows:

1. Hold down the left mouse button and draw a frame around the rung. At the same time, make sure that you select all instructions. Alternatively, you can hold down the <Shift> key and select the first the last instruction of the rung.
2. Right-click on one of the instructions in the rung.
3. Select the "Delete" command in the shortcut menu.

Basic information on rungs in LAD (Page 937)

Insert rung (Page 938)

Creating FBD programs

Basic information on FBD

FBD programming language

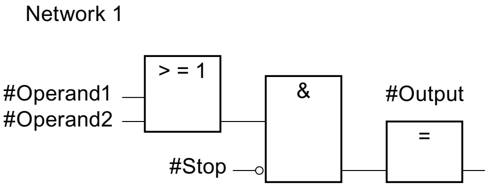
Overview of the Function Block Diagram (FBD) programming language

FBD is a graphical programming language. The representation is based on electronic circuit systems.

The program is mapped in one or more networks. A network contains one or more logic operation paths. The binary signal scans are linked by boxes. The representation of the logic is based on the graphical logic symbols used in Boolean algebra.

Example of networks in FBD

The following figure shows an FBD network with AND and OR boxes and an assignment:



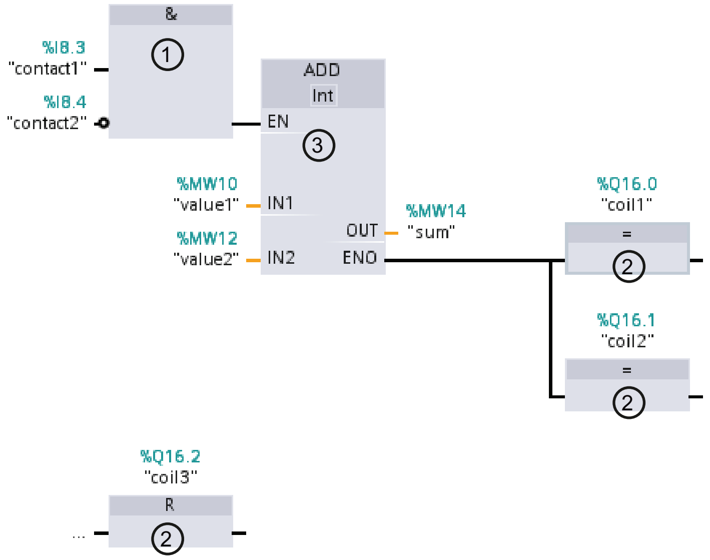
Overview of the FBD elements

FBD elements

An FBD program consists of separate elements that are linked by means of a binary signal flow. Most program elements must be supplied with tags.

A FBD network is programmed from left to right.

For example, the following figure shows elements of an FBD network:



1) Binary function

2) Standard box

3) Complex box

Binary functions

You can use binary functions to query binary operands and to combine their signal states. The following operations are examples of binary functions: "AND operation", "OR operation" and "EXCLUSIVE OR operation".

Standard boxes:

You can use standard boxes to control binary operands, perform RLO edge detection or execute jump functions in the program. Standard boxes generally have only one single input.

Complex boxes

Complex boxes represent program elements with complex functions. The empty box is an exception. You can use the empty box as a placeholder in which you can select the required instruction.

The following types of boxes are available to you in an FBD program:

- Complex boxes without EN/ENO mechanism:
  A box is executed independent of the signal state at the box inputs. The error status of the processing cannot be queried.
- Boxes with EN/ENO mechanism:
  A box is only executed if the enabling input "EN" carries the signal state "1". If the box is processed correctly, the "ENO" enable output has signal state "1". If an error occurs during processing, the "ENO" output is reset.
  If the EN enable input is not interconnected, the box is always executed.

Calls of code block are also shown in the network as complex boxes with EN/ENO mechanism.

Settings for FBD

Overview of the settings for FBD

Overview

The following table shows the settings that you can make:

Group	Setting	Description
Font	Size	Font size in program editor
View	Layout	Compact or wide Changes the vertical spacing between operands and other objects (such as operand and contact). The change becomes visible once the block is reopened.
	With absolute information	Additional display of the absolute addresses
Operand field	Maximum width	Maximum number of characters that can be entered horizontally in the operand field. This setting recalculates the layout of the networks.
	Maximum height	Maximum number of characters that can be entered vertically in the operand field. This setting recalculates the layout of the networks.

See also

Changing the settings (Page 942)

Changing the settings

Procedure

To change the settings, follow these steps:

1. Select the "Settings" command in the "Options" menu.

   The "Settings" window is displayed in the work area.
2. In the area navigation, select the "PLC programming" group.
3. Change the settings.

Result

The change will be loaded directly, there is no need to save it explicitly.

See also

Overview of the settings for FBD (Page 941)

Working with networks

Using networks

Function

The user program is created in the block within networks. For a code block to be programmed, it must contain at least one network. To achieve a better overview of the user program, you can also subdivide your program into several networks.

Entering the network title (Page 946)

Entering a network comment (Page 946)

Navigating networks (Page 947)

Inserting networks

Requirement

A block is open.

Procedure

To insert a new network, follow these steps:

1. Select the network after which you want to insert a new network.
2. Select the "Insert network" command in the shortcut menu.

Result

A new empty network is inserted into the block.

See also

Entering the network title (Page 946)

Entering a network comment (Page 946)

Navigating networks (Page 947)

Selecting networks

Requirements

A network is available.

Selecting a network

To select a network, follow these steps:

1. Click the title bar of the network that you want to select.

Selecting several networks

Proceed as follows to select several individual networks:

1. Press and hold down the <Ctrl> key.
2. Click all the networks that you want to select.

To select several successive networks, follow these steps:

1. Press and hold down the <Shift> key.
2. Click the first network that you want to select.
3. Click the last network that you want to select.

   The first and last networks and all those in between are selected.

Inserting networks (Page 942)

Entering the network title (Page 946)

Entering a network comment (Page 946)

Navigating networks (Page 947)

Copying and pasting networks

Copied networks can be pasted within the block or in another block. If the network is pasted into a block written in a different programming language, the programming language of the network is retained.

Requirements

A network is available.

Procedure

To copy and paste a network, follow these steps:

1. Select the network or networks to be copied.
2. Select "Copy" in the shortcut menu.
3. Select the network after which you want to paste in the copied network.
4. Select "Paste" in the shortcut menu.

Expanding and collapsing networks

Requirements

A network is available.

Opening and closing a network

To open a network, follow these steps:

1. Click on the right arrow in the network title bar.

To close a network, follow these steps:

1. Click on the down arrow in the network title bar.

Opening and closing all networks

To open and close all networks, follow these steps:

1. In the toolbar, click "Open all networks" or "Close all networks".

Navigating networks (Page 947)

Entering the network title

The network title is the header of a network. The length of the network title is limited to one line.

Requirement

A network is available.

Procedure

To enter a network title, follow these steps:

1. Click on the title bar of the network.
2. Enter the network title.

Entering a network comment (Page 946)

Navigating networks (Page 947)

Entering a network comment

You can use network comments to provide comments on the program contents of individual networks. For example, you can indicate the function of the network or draw attention to special characteristics.

Requirement

A network is available.

Procedure

To enter a network comment, follow these steps:

1. Click on the right arrow before the network title.
2. If the comment area is not visible, click "Network comments on/off" in the toolbar.

   The comment area is displayed.
3. Click "Comment" in the comment area.

   The "Comment" text passage is selected.
4. Enter the network comment.

Navigating networks (Page 947)

Navigating networks

You can navigate straight to a specific position within a block.

Procedure

To navigate to a specific position within a block, follow these steps:

1. Right-click on the white area of the programming window.
2. Select the "Go to > Network/line" command in the shortcut menu.

   The "Go to" dialog will open.
3. Enter the network to which you want to navigate.
4. Enter the line number of the network to which you want to navigate.
5. Confirm your entry with "OK".

Result

The relevant line will be displayed if this is possible. If the network or line requested does not exist, the last existing network or the last existing line in the network requested will be displayed.

Inserting FBD elements

Rules for the use of FBD elements

Rules

Note the following rules when inserting FBD elements:

- An FBD network can consist of several elements. All elements of a logic path must be linked to each other according to IEC 61131-3.
- Standard boxes (flip flops, counters, timers, math operations, etc.) can be added as output to boxes with binary logic operations (for example AND, OR). Comparison boxes are excluded from this rule.
- Only Boolean inputs in an instruction can be combined with preceding logic operations.
- Only the bottom Boolean output in an instruction can be combined with an additional logic operation.
- Enable input "EN" and enable output "ENO" can be connected to boxes, but this is not mandatory.
- Constants (e.g. TRUE or FALSE) cannot be assigned to binary logic operations. Instead of this, use tags of the BOOL data type.
- Only one jump instruction can be inserted in each network.
- Only one jump label can be inserted in each network.
- Instructions for positive or negative RLO edge detection may not be arranged right at the left of the network as this requires a prior logic operation.

Placement rules for S7-1200 CPUs

The following table sets out the instructions that can only be positioned at the end of the network:

Instruction		Prior logic operation required
Mnemonics	Name	
SET_BF	Set bit field	No
RESET_BF	Reset bit field	No
TP	Start pulse timer	Yes
TON	Start on-delay timer	Yes
TOF	Start off-delay timer	Yes
TONR	Time accumulator	Yes
JMP	Jump if RLO=1	No
JMPN	Jump if RLO=0	Yes
JMP_LIST	Define jump list	No
SWITCH	Jump distributor	No
RET	Return	No

Placement rules for S7-300/400 CPUs

The following table sets out the instructions that can only be positioned at the end of the network:

Instruction		Prior logic operation required
Mnemonics	Name	
S	Set output	Yes
R	Reset output	Yes
SP	Start pulse timer	Yes
SE	Start extended pulse timer	Yes
SD	Start on-delay timer	Yes
SS	Start retentive on-delay timer	Yes
SF	Start off-delay timer	Yes
SC	Set counter value	Yes
CU	Count up	Yes
CD	Count down	Yes
JMP	Jump if RLO=1	No
JMPN	Jump if RLO=0	Yes
RET	Return	No
OPN	Open global data block	No
OPNI	Open instance data block	No
CALL	Call block	No

Instruction		Prior logic operation required
Mnemonics	Name	
SAVE	Save RLO in BR bit	No
MCRA	Enable MCR range	No
MCRD	Disable MCR range	No
MCR<	Open MCR ranges	No
MCR>	Close MCR ranges	No

Inserting FBD elements using the "Instructions" task card

Requirement

A network is available.

Procedure

To insert FBD elements into a network using the "Instructions" task card, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to the FBD element that you want to insert.
3. Use drag-and-drop to move the element to the desired place in the network.

   If the element is an internal system function block (FB), the "Call options" dialog opens. In this dialog you can create an instance data block of the single-instance or multiple-instance type for the function block in which the data of the inserted element will be saved. You will find the new instance data block created in the project tree in the "Program resources" folder under "Program blocks > System blocks". If you have selected "multi-instance", these are located in the block interface in the "Static" section.

Or:

1. Select the point in the network at which you want to insert the element.
2. Open the "Instructions" task card.
3. Double-click on the element you want to insert.

   If the element is an internal system function block (FB), the "Call options" dialog opens. In this dialog you can create an instance data block of the single-instance or multiple-instance type for the function block in which the data of the inserted element will be saved. You will find the new instance data block created in the project tree in the "Program resources" folder under "Program blocks > System blocks". If you have selected "multi-instance", these are located in the block interface in the "Static" section.

Result

The selected FBD element is inserted with dummy entries for the parameters.

See also

Rules for the use of FBD elements (Page 948)

Inserting FBD elements using an empty box

Requirement

A network is available.

Procedure

To insert FBD elements into a network using an empty box, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "General > Empty box" in the "Basic instructions" palette.
3. Use a drag-and-drop operation to move the "Empty box" element to the desired place in the network.
4. Position the cursor over the triangle in the top right-hand corner of the empty box.

   A drop-down list is displayed.
5. Select the desired FBD element from the drop-down list.

   If the element is an internal system function block (FB), the "Call options" dialog opens. In this dialog you can create an instance data block of the single-instance or multiple-instance type for the function block in which the data of the inserted element will be saved. You will find the new instance data block created in the project tree in the "Program resources" folder under "Program blocks > System blocks". If you have selected "multi-instance", these are located in the block interface in the "Static" section.

Result

The empty box is changed to the respective FBD element. Placeholders are inserted for the parameters.

Selecting the data type of an FBD element

Selecting a data type

Introduction

Some instructions can be executed with several different data types. If one of these instructions is used in the program, a valid data type must be specified for the instruction at the specific point in the program. Data types for the inputs and outputs must be explicitly selected for some instructions.

Note

The valid data type (BOOL) for the tags on the enable input ENO and the enable output ENO is predefined by the system and cannot be changed.

The valid data types for an instruction are listed in the instruction drop-down list. You specify the data type of the instruction by selecting an entry from the drop-down list. If the data type of a specified tag differs from the data type of the instruction, the tag name will be displayed in red and a rollout with the corresponding error message will appear.

Defining the data type of an instruction

Introduction

Some instructions can be executed with several different data types. If such instructions are to be inserted in the program, a data type for their execution must be defined at the specific point in the program in question.

Specifying the data type by means of the drop-down list

To define the data type of an instruction using the drop-down list, follow these steps:

1. Insert the instruction at the required point in the program using drag-and-drop.

   The instruction will be inserted at the selected point in the program. The entry "???" (undefined) is displayed in the drop-down list.

2. Click the yellow triangle in the upper corner of the drop-down list.

   The drop-down list will open to display the data types valid for the instruction.

3. Select a data type from the drop-down list.

   The selected data type is displayed.

4. If the instruction has two drop-down lists, select the data type for the instruction inputs in the left-hand drop-down list and the data type for the instruction outputs in the right-hand drop-down list.

Specifying data type by assigning tags

To define the data type of an instruction by assigning tags, follow these steps:

1. Insert the instruction at the required point in the program using drag-and-drop.

   The instruction will be inserted at the selected point in the program. The entry "???" (undefined) is displayed in the drop-down list.
2. At an input or output, specify a valid tag, the data type of which is to be applied as the instruction data type.

   The selected data type is displayed in the drop-down list.
3. Enter a valid tag at an input and a valid tag at an output if data types are to be defined for the instruction inputs and outputs. The tag specified at the input determines the data type of the inputs; the tag specified at the output determines the data type of the outputs of the instruction.

Using favorites

Adding FBD elements to Favorites

Requirement

- A block is open.
- The multipane mode is set for the "Instructions" task card or the Favorites are also displayed in the editor.

Procedure

To add SCL instructions to the Favorites, follow these steps:

1. Open the "Instructions" task card.
2. Maximize the "Basic instructions" pane.
3. Navigate in the "Basic instructions" pane to the instruction that you want to add to the Favorites.
4. Drag-and-drop the instruction into the "Favorites" pane or into the Favorites area in the program editor.

Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

Inserting FBD elements using favorites

Requirement

- A block is open.
- Favorites are available.

Procedure

To insert an instruction into a program using Favorites, follow these steps:

1. Drag-and-drop the desired instruction from Favorites to the desired position.

Or:

1. Select the position in the program where you want to insert the instruction.
2. In the Favorites, click on the instruction you want to insert.

Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

Inserting block calls in FBD

Inserting block calls using a drag-and-drop operation

You can insert calls for existing functions (FC) and function blocks (FB) using a drag-and-drop operation from the project tree. If you call function blocks from other function blocks, you can either call them as single-instance or multi-instance blocks. If a function block is called as single instance, it will store its data in a data block of its own. If a function block is called as multi-instance, it will store its data in the instance data block of the calling function block.

Requirement

- A network is available.
- The block that is to be called is available.

Inserting a call of a function (FC)

To insert a call of a function (FC) into a network using a drag-and-drop operation, follow these steps:

1. Drag the function from the project tree to the required network.

Inserting a call for a function block (FB)

To insert a call for a function block (FB), follow these steps:

1. Drag the function block from the project tree to the required network.

   The "Call options" dialog opens.

2. Enter in the dialog whether you wish to call the block as single or multi-instance.

   – If you click on the "Single instance" button, you will have to enter a name in the "Name" text box for the data block that you want to assign to the function block.

   – If you click on the "Multi-instance" button, you will have to enter the name of the tag in the "Name in the interface" text box; this is the name that you use to enter the called function block as a static tag in the interface of the calling block.

3. Confirm your entries with "OK".

Result

The function or the function block is inserted with its parameters. You can then assign the parameters.

See also: Parameter transfer at block call (Page 707)

Note

If when calling a function block you specify an instance data block that does not exist, it will be created. If you have called a function block as a multi-instance, this will be entered as a static tag in the interface.

See also

Updating block calls in FBD (Page 956)

Correcting the call type (Page 957)

Single instances (Page 704)

Multi-instances (Page 706)

Updating block calls in FBD

If interface parameters of a called block are changed, the block call can no longer be executed correctly. You can avoid such inconsistent block calls by updating the block calls.

You have two options to update the block calls:

- Explicit updating in the program editor.

  The block calls in the open block will be updated.

- Implicit updating during compilation.

  All block calls in the program as well as the used PLC data types will be updated.

Update blocks in the program editor

To update a block call within a block, follow these steps:

1. Open the block in the program editor.
2. Click "Update inconsistent block calls" in the toolbar.

Or:

1. Open the block in the program editor.
2. Right-click on the instruction with the block call.
3. Select the "Update" command in the shortcut menu.

   The "Interface update" dialog opens. This dialog shows the differences between the block interface in use and the changed interface of the called block.
4. If you want to update the block call, click "OK". To cancel the update, click "Cancel".

Update block calls during compilation

Follow these steps to update all block calls and uses of PLC data types during compilation implicitly:

1. Open the project tree.
2. Select the "Program blocks" folder.
3. Select the command "Compile > Software (rebuild all blocks)" in the shortcut menu.

See also

Inserting block calls using a drag-and-drop operation (Page 955)

Correcting the call type (Page 957)

Correcting the call type

Call type

There are two ways of calling function blocks:

- As a single instance
- As a multi-instance

See also: Call function blocks as single or multi-instances (Page 704)

You can modify a defined call type at any time.

Requirement

The user program contains a block call.

Procedure

To change the call type of a function block, follow these steps:

1. Open the code block and select the block call.
2. Select the "Change call type" command in the shortcut menu.

   The "Call options" dialog opens.
3. Click the "Single instance" or "Multi instance" button.
   - If you select the "Single instance" call type, enter a name for the data block that will be assigned to the function block.
   - If you select "Multi-instance" as the call type, enter the name of the tag in the "Name in the interface" text block with which the called function block will be entered as a static tag in the interface of the calling block.
4. Confirm your entries with "OK".

Note

The previous single and multiple instances will not be deleted automatically.

See also

Inserting block calls using a drag-and-drop operation (Page 955)

Updating block calls in FBD (Page 956)

Inserting complex FBD instructions

Using the "Calculate" instruction

Requirement

A network is available.

Procedure

Proceed as follows to use the "Calculate" instruction:

1. Open the "Instructions" task card.
2. Navigate to "Math functions > CALCULATE" in the "Basic instructions" pane.
3. Use drag-and-drop to move the element to the desired place in the network.

   The instruction "Calculate" will be inserted for the data type with a placeholder expression and question mark.
4. Enter the data type for the calculation.

5. Enter the operands for the calculation.

   Note

   The calculation is run with the inputs of the "Calculate" instruction. If you want to use constants you must also insert appropriate inputs for them.

   ---

6. Click on the "Edit 'Calculate' instruction" button to replace the placeholder expression with the correct expression.

   The "Edit 'Calculate' instruction" dialog will open.

7. Enter the required expression in the "OUT:= " text box.

   Note

   In the "Example" area you can find an example of a valid expression and possible instructions that you can use.

   To determine a value with the help of Pythagoras' theorem, for example, enter "OUT := SQRT (SQR (IN1) + SQR (IN2))".

   ---

8. Confirm your entry with "OK".

Using free-form comments

Basic information on using free comments in FBD

Introduction

Free-form comments allow you to add comments to the source code for graphic programming languages similar to line comments for textual languages.

Free-form comments can be used for all non-binary boxes.

See also

Inserting free-form comments (Page 960)

Editing free-form comments (Page 960)

Deleting free-form comments (Page 961)

Inserting free-form comments

Requirement

A network with instructions is available.

Procedure

To insert a free-form comment, proceed as follows:

1. Right-click on the instruction for which you want to insert a free-form comment.
2. Select the "Insert comment" command in the shortcut menu.

   A comment box with a standard comment opens. The comment box is connected by an arrow to the corresponding instruction.
3. Enter the required comment in the comment box.

See also

Basic information on using free comments in FBD (Page 959)

Editing free-form comments (Page 960)

Deleting free-form comments (Page 961)

Editing free-form comments

Introduction

Free-form comments can be edited as follows:

- Changing the comment text
- Changing the position and size of the comment box
- Attaching a comment to another element
- Showing and hiding free comments

Changing the comment text

To change the text of free-form comments, follow these steps:

1. Click on the comment box.
2. Enter the desired text.

Changing the position of the comment box

To change the positioning of the comment box, follow the steps below:

1. Left-click the comment box and keep the mouse button pressed.
2. Drag the comment box to the desired location.

Changing the size of the comment box

To change the size of the comment box, follow the steps below:

1. Click on the comment box.
2. Drag the comment box on the move handle in the lower right corner to the desired size.

Attaching a comment to another element

To attach a free-form comment to another element, follow these steps:

1. Left-click the point of the arrow that links the comment box with the instruction and keep the mouse button pressed.
2. Drag the arrow to the element to which you want to attach the comment. Possible insertion points are marked with a green square.
3. Release the mouse button.

Showing and hiding free comments

To show or hide a free-form comments, follow these steps:

1. Click the "Free-form comment on/off" button in the toolbar.

See also

Basic information on using free comments in FBD (Page 959)

Basic information on using free comments in FBD (Page 959)

Inserting free-form comments (Page 960)

Editing free-form comments (Page 960)

Editing FBD elements

Selecting FBD elements

You can select several individual elements or all elements in a network.

Requirement

FBD elements are available

Selecting several individual FBD elements

To select several individual FBD elements, follow these steps:

1. Press and hold down the <Ctrl> key.
2. Click on all the FBD elements you wish to select.
3. Now release the <Ctrl> key.

Selecting all FBD elements in a network

To select all FBD elements in a network, follow these steps:

1. Place the cursor in the network whose elements you wish to select.
2. Select the "Select all" in the "Edit" menu or press <Ctrl A>.

Removing instruction inputs and outputs (Page 966)

Deleting FBD elements (Page 967)

Copying FBD elements

Requirement

An FBD element is available.

Procedure

To copy an FBD element, follow these steps:

1. Right-click the FBD element that you want to copy.
2. Select "Copy" in the shortcut menu.

Result

The FBD element will be copied and saved to the clipboard.

See also

Removing instruction inputs and outputs (Page 966)

Deleting FBD elements (Page 967)

Cutting FBD elements

Requirement

An FBD element is available.

Cutting

To cut an FBD element, follow these steps:

1. Right-click the FBD element that you want to cut.
2. Select "Cut" in the shortcut menu.

Result

The FBD element will be cut and saved to the clipboard.

Removing instruction inputs and outputs (Page 966)

Deleting FBD elements (Page 967)

Pasting an FBD element from the clipboard

Requirement

An FBD element is available.

Procedure

To paste an FBD element from the clipboard, follow these steps:

1. Copy an FBD element or cut an FBD element.
2. Right-click the point in the network where you want to paste the element.
3. Select "Paste" in the shortcut menu.

Removing instruction inputs and outputs (Page 966)

Deleting FBD elements (Page 967)

Replacing FBD elements

You can easily exchange FBD elements with other FBD elements of the same type. This has the advantage that the parameters are retained and need not be entered again. For example, you can exchange OR and AND, RS-FlipFlop and SR-FlipFlop, comparison functions or jump instructions.

Requirements

A network with at least one FBD element is present.

Procedure

To replace an FBD element with another FBD element, follow these steps:

1. Select the FBD element that you want to replace.

   If elements compatible with the selected FBD element are available, a triangle will appear in the upper right-hand corner of the element.
2. Position the cursor above the triangle of the FBD element.

   A drop-down list is displayed.
3. From the drop-down list, select the FBD element that you want to use to replace the existing FBD element.

Removing instruction inputs and outputs (Page 966)

Deleting FBD elements (Page 967)

Adding additional inputs and outputs to FBD elements

Introduction

You can expand several FBD elements with additional inputs that execute arithmetic or binary operations. Such elements are, for example, the instructions "Add" (ADD), "Multiply" (MUL), AND or OR. You can expand the "MOVE value" (MOVE) and "Demultiplex" (DEMUX) instruction boxes by adding additional outputs.

The name of the new inputs and outputs is comprised of the type of inserted element and a consecutive number. The name of a new input is may be "IN2"; the name of a new output may be "OUT2".

Requirements

An FBD element is available that permits the insertion of additional inputs and outputs.

Inserting an additional input

To add an additional input to the box of an FBD element, follow these steps:

1. Right-click on an existing input of the FBD element.
2. Select "Insert input" in the shortcut menu.

   An additional input is added to the box of the FBD element.

Or:

1. Click on the yellow star symbol beside the last input in the instruction box.

   An additional input is added to the box of the FBD element.

Inserting an additional output

To add an additional output to the box of an FBD element, follow these steps:

1. Right-click on an existing output of the FBD element.
2. Select "Insert output" from the shortcut menu.

   An additional output is added to the box of the FBD element.

Or:

1. Click on the yellow star symbol beside the last output of the instruction box.

   An additional output is added to the box of the FBD element.

Deleting FBD elements (Page 967)

Removing instruction inputs and outputs

Introduction

Inputs and outputs which you have added to an instruction can be removed.

Requirement

An FBD element is available, which you have expanded with additional inputs or outputs.

Remove input

To remove an input, follow these steps:

1. Select the input that you want to remove.
2. Select the "Delete" command in the shortcut menu.

   The input of the FBD element is removed.

Remove output

To remove an output, follow these steps:

1. Select the output that you want to remove.
2. Select the "Delete" command in the shortcut menu.

   The output of the FBD element will be removed.

Adding additional inputs and outputs to FBD elements (Page 965)

Deleting FBD elements (Page 967)

Deleting FBD elements

Requirement

An FBD element is available.

Procedure

To delete an FBD element, follow these steps:

1. Right-click the FBD element that you want to delete.
2. Select the "Delete" command in the shortcut menu.

See also

Selecting FBD elements (Page 962)

Copying FBD elements (Page 963)

Cutting FBD elements (Page 963)

Pasting an FBD element from the clipboard (Page 964)

Replacing FBD elements (Page 964)

Adding additional inputs and outputs to FBD elements (Page 965)

Removing instruction inputs and outputs (Page 966)

Inserting operands in FBD instructions

Inserting operands

The character strings "<???>", "<??.?>" and "..." are inserted as placeholders for the parameters when a FBD element is inserted. The "<???>" and "<??.?>" strings displayed in red indicate parameters that need to be connected. The "..." string displayed in black indicates parameters that may be connected. "<??.?>" stands for Boolean placeholders.

Note

To display the available data types in a tooltip, move the cursor over the placeholder.

Requirement

An FBD element is available.

Procedure

To connect the parameters of an FBD element, follow these steps:

1. Click the placeholder of the parameter.

   An input field is opened.

2. Enter the corresponding parameters, for example a PLC tag, a local tag or a constant.

   ### Note

   If you enter the absolute address of a parameter that has already been defined, this absolute address will be changed to the symbolic name of the parameter as soon as the input is confirmed. If you have not yet defined the parameter, a new tag with this absolute address and the default name "Tag_1" will be entered in the PLC tag table. When you confirm your input, the absolute address will be replaced with the symbolic name "Tag_1".

3. Confirm the parameter with the Enter key.
4. If you have not yet defined the parameter, you can define it directly in the program editor using the shortcut menu.

   See also: "Declaring PLC tags in the program editor (Page 832)".

Or drag from it the PLC tag table:

1. In the project tree, select the "PLC tags" folder and open the PLC tag table.
2. If you have opened the PLC tag table, drag the desired tag to the corresponding location in your program. If you have not opened the PLC tag table yet, open the detail view now. Drag the desired tag from the detail view to the appropriate place in your program.

Or drag from it the block interface:

1. Open the block interface.
2. Drag the desired operand from the block interface to the corresponding location in your program.

Result

- If the syntax is error-free, the displayed parameter is black.
- If there is an error in the syntax, the cursor stays in the input field and a corresponding error message is displayed in the inspector window in the "Info > Syntax" register.

Wiring hidden parameters

Introduction

Depending on the CPU used, you can use complex instructions in your program that are dispatched with the TIA portal. These instructions can contain parameters that are declared as hidden.

If an instruction contains hidden parameters, the instruction box has a small arrow on the lower edge. You can recognize hidden parameters by their white font.

You can show and wire the hidden parameters at any time.

Showing or hiding hidden parameters

To show or hide hidden parameters, follow these steps:

1. Click on the down arrow at the bottom edge of the instruction box to show hidden parameters.
2. Click on the up arrow at the bottom edge of the instruction box to hide hidden parameters.

Wiring hidden parameters

To wire parameters, follow these steps:

1. Wire the hidden parameters like normally visible parameters.

   The hidden parameter is transformed into a visible parameter.

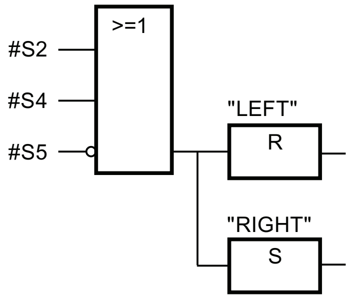
Branches in FBD

Basic information on branches in FBD

Definition

You can use the Function Block Diagram (FBD) programming language to program parallel branches. This is done using branches that are inserted between the boxes. You can insert additional boxes within the branch and in this way build up complex function block diagrams.

The figure below shows an example of the use of branches:



See also

Rules for branches in FBD (Page 970)

Inserting branches in FBD networks (Page 971)

Deleting branches in FBD networks (Page 971)

Rules for branches in FBD

Rules

The following rules apply to the use of branches in FBD:

- Branches are opened downward.
- Branches can be inserted only between FBD elements.
- To delete a branch, you must delete all FBD elements, including the branch itself.
- If you delete the connection between two branches, the FBD elements of the interrupted branch will be positioned freely in the network.

See also

Basic information on branches in FBD (Page 970)

Inserting branches in FBD networks (Page 971)

Deleting branches in FBD networks (Page 971)

Inserting branches in FBD networks

Requirement

A network is available.

Procedure

To insert a new branch in a network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "General > Branch" in the "Basic instructions" palette.
3. Drag the element from the "Elements" pane to the a required location on a connection line between two boxes.

See also

Rules for branches in FBD (Page 970)

Basic information on branches in FBD (Page 970)

Deleting branches in FBD networks (Page 971)

Deleting branches in FBD networks

Requirement

A branch is available.

Procedure

To delete a branch, follow these steps:

1. Select the connection line that links the branch to the main branch.
2. Select the "Delete" command in the shortcut menu.

Result

The branch is now deleted. Boxes connected to the deleted branch are placed freely within the network.

See also

Rules for branches in FBD (Page 970)

Basic information on branches in FBD (Page 970)

Inserting branches in FBD networks (Page 971)

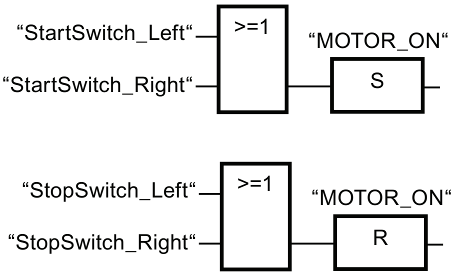
Logic paths in FBD

Basic information on logic paths in FBD

Use of logic paths

The user program will be mapped in one or more networks. The networks can contain one or more logic paths on which the binary signals are arranged in the form of boxes.

The following figure shows an example of the use of several logic paths within a network:



Rules

Remember the following rules when using logic paths:

- Connections are not permitted between logic paths.
- Only one jump instruction is permissible per network. The positioning rules for jump instructions remain valid.

Executing logic paths

Logic paths are executed from top to bottom and from left to right. This means that the first instruction in the first logic path of the first network is executed first. All instructions of this logic path are then executed. After this come all other logic paths of the first network. The next network is executed only after all logic paths have first been executed.

When jumps are used the regular execution of the logic paths is circumvented and the instruction is executed at the jump destination.

Differences between branches and logic paths

The difference between branches and logic paths is that the logic paths are independent branches that can also stand in a different network. Branches, on the other hand, permit the programming of a parallel connection and have a common preceding logic operation.

See also

Inserting a logic path (Page 973)

Deleting a logic operation path (Page 973)

Inserting a logic path

Requirement

- A block is open.
- A network is available.

Procedure

To insert a new logic path in a network, follow these steps:

1. Insert any instruction in a network in such a way that it has no connection to existing instructions.

   A new logic path is inserted.
2. Insert an assignment at the end of the new logic path.
3. Insert additional instructions in the new logic path.

See also

Basic information on logic paths in FBD (Page 972)

Deleting a logic operation path (Page 973)

Deleting a logic operation path

Requirement

A logic path is available.

Procedure

To delete a logic path, proceed as follows:

1. Hold down the left mouse button and draw a frame around the logic path. At the same time, make sure that you select all instructions of the logic path. Alternatively, you can hold down the <Shift> key and select the first the last instruction of the logic path.
2. Right-click on one of the instructions in the logic path.
3. Select the "Delete" command in the shortcut menu.

Inserting a logic path (Page 973)

Creating SCL programs

Basics of SCL

Programming language SCL

Programming language SCL

SCL (Structured Control Language) is a high-level programming language based on PASCAL. The language is based on DIN EN 61131-3 (international IEC 1131-3).

The standard standardizes programming languages for programmable logic controllers. The SCL programming language fulfills the PLCopen Basis Level of ST language (Structured Text) defined in this standard.

Language elements

SCL also contains higher programming languages in addition to the typical elements of the PLC, such as inputs, outputs, timers or memory bits.

- Expressions
- Value assignments
- Operators

Program control

SCL provides convenient instructions for controlling the program allowing you, for example, to create program branches, loops or jumps.

Application

SCL is therefore particularly suitable for the following areas of application:

- Data management
- Process optimization
- Recipe management
- Mathematical / statistical tasks

Expressions

Description

Expressions are calculated during the runtime of the program and return a value. An expression consists of operands (such as constants, tags or function calls) and optionally out of operators (such as *, /, + or -). Expressions can be linked together or nested within each other by operators.

Evaluation order

The evaluation of the expression occurs in a specific order that is defined by the following factors:

- Priority of the operators involved
- Left-to-right order
- Brackets

Types of expressions

The following expression types are available depending on the operator:

- Arithmetic expressions

  Arithmetic expressions consist of either a numerical value or combine two values or expressions with arithmetic operators.
- Relational expressions

  Relational expressions compare the values of two operands and yield a Boolean value. The result is TRUE if the comparison is true, and FALSE if it is not met.
- Logical expressions

  Logical expressions combine two operands with logical operators (AND, OR, XOR) or negating operands (NOT).

How expressions are used

You can use the result of an expression in different ways:

- As a value assignment for a tag
- As as a condition for a control instruction
- As a parameter for a calling a block or instruction

See also

Operators and operator precedence (Page 980)

Arithmetic expressions (Page 976)

Relational expressions (Page 978)

Logical expressions (Page 979)

Arithmetic expressions

Description

Arithmetic expressions consist of either a numerical value or combine two values or expressions with arithmetic operators.

Arithmetic operators can process the data types that are allowed in the CPU in use. The data type of the result is determined by the type of the most significant operand. For example, when you link an INT type operand to a DINT type operand, the result is type DINT.

Data types of arithmetic expressions

The following table shows the data types you can use in arithmetic expressions:

Operation	Operator	1. Operand	2. Operand	Result
Power	**	Integer/floating-point number	Integer/floating-point number	Floating-point number
Unary plus	+	Integer/floating-point number TIME	-	Integer/floating-point number TIME
Unary minus	-	Integer/floating-point number TIME	-	Integer/floating-point number TIME
Multiplication	*	Integer/floating-point number	Integer/floating-point number	Integer/floating-point number
		TIME	Integer	TIME
Division	/	Integer/floating-point number	Integer/floating-point number (not equal 0)	Integer/floating-point number
		TIME	Integer	TIME

Operation	Operator	1. Operand	2. Operand	Result
Modulo function	MOD	Integer	Integer	Integer
Addition	+	Integer/floating-point number	Integer/floating-point number	Integer/floating-point number
		TIME	TIME	TIME
		TOD	TIME	TOD
		DT	TIME	DT
Subtraction	-	Integer/floating-point number	Integer/floating-point number	Integer/floating-point number
		TIME	TIME	TIME
		TOD	TIME	TOD
		DATE	DATE	TIME
		TOD	TOD	TIME
		DT	TIME	DT
		DT	DT	Time

For additional information on valid data types, refer to "See also".

Example

The following example shows an arithmetic expression:

```
SCL
"MyTag1":= "MyTag2" * "MyTag3";
```

See also

Expressions (Page 975)

Relational expressions

Description

Relational expressions compare the values of two operands and yield a Boolean value. The result is TRUE if the comparison is true, and FALSE if it is not met.

Relational operators can process the data types that are allowed in the CPU in use. The data type of the result always is BOOL.

Note the following rules when forming relational expressions:

- All tags are comparable within the following data type groups:
  - Integers/floating-point numbers
  - Binary numbers/bit strings
  - String
- With the following data types/data groups, only tags of the same type can be compared:
  - TIME
  - Date and time
- The comparison of strings is based on the ASCII character set. The length of the tags and the numerical value of each ASCII character are used for the comparison.
- S5-TIME tags are not permitted as relational operands. An explicit conversion from S5TIME to TIME is necessary.

Data types of relational expressions

The following table shows the data types/data type groups you can use in relational expressions:

Operation	Operator	1. Operand	2. Operand	Result
Compare for equal, not equal	=, <>	Integer/floating-point number	Integer/floating-point number	BOOL
		Binary number	Binary number	BOOL
		String	String	BOOL
		TIME	TIME	BOOL
		Date and time	Date and time	BOOL
Compare for less than, less than-equal to, greater than, greater than or equal to	<, <=, >, >=	Integer/floating-point number	Integer/floating-point number	BOOL
		String	String	BOOL
		TIME	TIME	BOOL
		Date and time	Date and time	BOOL

For additional information on valid data types, refer to "See also".

Example

The following example shows a relational expression:

SCL

```
IF a > b THEN c:= a;
IF A > 20 AND B < 20 THEN C:= TRUE;
IF A<>(B AND C) THEN C:= FALSE;
```

Note

The comparison for STRING and DT are executed internally in the S7-300/400 by extended instructions. The following operands are not permitted for these functions:

- Parameter of a FC
- In-out parameter of an FB of type STRUCT or ARRAY

See also

Expressions (Page 975)

Logical expressions

Description

Logical expressions combine two operands with logical operators (AND, OR, XOR) or negating operands (NOT).

Logical operators can process the data types that are allowed in the CPU in use. The result of a logical expression is of BOOL data type, if both operands are of BOOL data type. If at least one of both operands is a bit string, then the result is also a bit string and is determined by the type of the highest operand. For example, when you link a BOOL type operand to a WORD type operand, the result is type WORD.

Data types of logical expressions

The following table shows the data types you can use in logical expressions:

Operation	Operator	1. Operand	2. Operand	Result
Negation	NOT	Binary number	-	Binary number
AND logic operation	AND or &	Binary number	Binary number	Binary number
		Bit string	Bit string	Bit string
OR logic operation	OR	Binary number	Binary number	Binary number
		Bit string	Bit string	Bit string
EXCLUSIVE OR logic operation	XOR	Binary number	Binary number	Binary number
		Bit string	Bit string	Bit string

Example

The following example shows a logical expression:

```
SCL
IF "MyTag1" AND NOT "MyTag2" THEN c:=a;
MyTag:=ALPHA OR BETA;
```

See also

Expressions (Page 975)

Operators and operator precedence

Operators and their order of evaluation

Expressions can be linked together or nested within each other by operators.

The order of evaluation for expressions depends on the precedence of operators and brackets. The following basic rules apply:

- Arithmetic operators are evaluated before relational operators and relational operators are evaluated before logical operators.
- Operators with no precedence are evaluated according to their occurrence from left to right.
- Operations in brackets are evaluated first.

The following table provides an overview of the operators and their precedence:

Operator	Operation	Precedence
Arithmetic expressions		
**	Power	2
+	Unary plus	3

Operator	Operation	Precedence
-	Unary minus	3
*	Multiplication	4
/	Division	4
MOD	Modulo function	4
+	Addition	5
-	Subtraction	5
Relational expressions		
<	Less than	6
>	Greater than	6
<=	Less than or equal	6
>=	Greater than or equal	6
=	Equal	7
<>	Not equal	7
Logical expressions		
NOT	Negation	3
AND or &	Boolean AND	8
XOR	Exclusive OR	9
OR	Boolean OR	10
Miscellaneous operations		
( )	Brackets	1
:=	Assignment	11

See also

Expressions (Page 975)

Value assignments

Definition

You can use a value assignment to assign the value of an expression to a tag. On the left side of the assignment is the tag that takes the value of the expression on the right.

The name of a function can also be specified as an expression. The function is called by the value assignment and sends its return value back to the tag on the left.

The data type of value assignment is defined by the data type of the tag on the left. The data type of the expression on the right must match this type.

For additional information on compatibility and conversion of data types, refer to "See also".

Value assignments for STRUCT data type or PLC data type

An entire structure can be assigned to another if the structures are identically organized and the data types as well as the names of the structural components match.

You can assign a tag, an expression or another structural element to an individual structural element.

Value assignments for the ARRAY data type

An entire ARRAY can be assigned to another ARRAY if both the data types of the ARRAY elements as well as the ARRAY limits match.

You can assign a tag, an expression or another ARRAY element to an individual ARRAY element.

Value assignments for the STRING data type

An entire STRING can be assigned to another STRING. If the assigned character string is longer than the string on the left, a warning is generated during compiling.

You can assign another STRING element to an individual STRING element.

Examples

The following table shows examples for value assignments:

SCL	
`"MyTag1" := "MyTag2";`	`(* Assignment of a tag*)`
`"MyTag1" := "MyTag2" * "MyTag3";`	`(* Assignment of an expression*)`
`"MyTag" := "MyFC"();`	`(* Call a function, which assigns its return value to the "MyTag" tag*)`
`#MyStruct.MyStructElement := "MyTag";`	`(* Assignment of a tag to a structure element*)`
`#MyArray[2] := "MyTag";`	`(* Assignment of a tag to an ARRAY element*)`
`"MyTag" := #MyArray[1,4];`	`(* Assignment of an ARRAY element to a tag*)`
`#MyString[2] := #MyOtherString[5];`	`(* Assignment of a STRING element to another STRING element*)`

Settings for SCL

Overview of the settings for SCL

Overview

The following tables show the settings you can make for SCL:

Editor settings

Group	Setting	Description
View	Keyword highlighting	Notation used to represent the keywords of the programming language. You can choose between uppercase and lowercase letters or a notation corresponding to the conventions of the Pascal programming language.

Default settings for new blocks

If you create new blocks, the following settings are set as default values. You can change these in the block properties at a later point in time.

Group	Setting	Description
Compile	Create extended status information	Allows all tags in a block to be monitored. The memory requirements of the program and execution times increase, however, with this option.
	Check ARRAY limits	Checks at runtime whether array indices are within the declared range for an ARRAY. If an array index exceeds the permissible range, the enable output ENO of the block is set to "0".
	Set ENO automatically	Checks at runtime whether errors occur in the processing of certain instructions. If a runtime error occurs, the enable output ENO of the block is set to "0".

See also

Changing the settings (Page 983)

Changing the settings

Procedure

To change the settings, follow these steps:

1. Select the "Settings" command in the "Options" menu.

   The "Settings" window is displayed in the work area.
2. In the area navigation, select the "PLC programming" group.
3. Change the settings.

Result

The change will be loaded directly, there is no need to save it explicitly.

See also

Overview of the settings for SCL (Page 982)

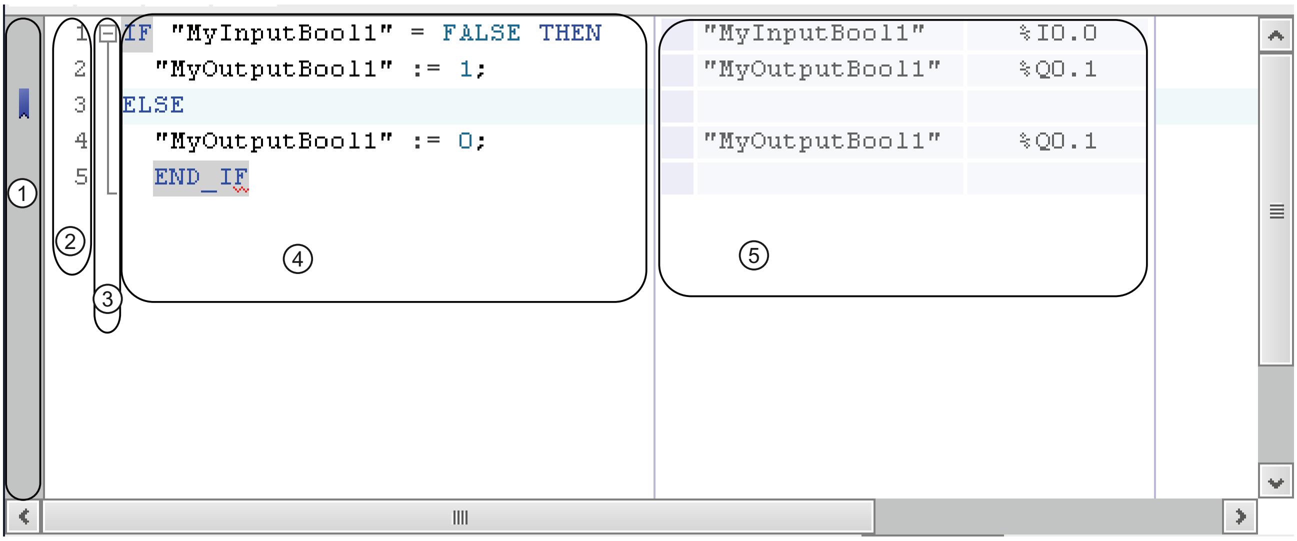
The programming window of SCL

Overview of the programming window

Function

The programming window is the work area, where you enter the SCL program.

The following figure shows the programming window of SCL:



```
IF "MyInputBool1" = FALSE THEN
  "MyOutputBool1" := 1;
ELSE
  "MyOutputBool1" := 0;
  END_IF
```

```
"MyInputBool1"     %I0.0
"MyOutputBool1"    %Q0.1

"MyOutputBool1"    %Q0.1
```

The programming window consists of the following sections:

Section	Meaning
① Sidebar	You can set bookmarks and breakpoints in the sidebar.
② Line numbers	The line numbers are displayed to the left of the program code.
③ Outline view	The outline view highlights related code sections.
④ Code area	You edit the SCL program in the code area.
⑤ Display of the absolute operands	This table shows the assignment of symbolic operands to absolute addresses.

Using bookmarks (Page 988)

Customizing the programming window (Page 985)

Indenting and outdenting lines (Page 986)

Expanding and collapsing sections of code (Page 987)

Customizing the programming window

Introduction

You can customize the appearance of the programming window and the program code in the following way:

- By setting the font, size and color
- By setting the tab spacing
- By displaying the line numbers
- By showing or hiding the absolute operands

Setting the font, size and color

To set the font, size and color, follow these steps:

1. Select the "Settings" command in the "Options" menu.

   The "Settings" window is displayed in the work area.
2. Select the "General > Text editors" group.
3. Select the desired font and font size or choose a font color for the individual language elements.

Setting the tab spacing

To provide a better overview of the program, lines are indented according to syntax. Define the depth of indentation with the tab spacing.

To set the tab spacing, follow these steps:

1. Select the "Settings" command in the "Options" menu.

   The "Settings" window is displayed in the work area.
2. Select the "General > Text Editors" group.
3. Set the tab spacing.

Show line numbers

To display the line numbers, follow these steps:

1. Select the "Settings" command in the "Options" menu.

   The "Settings" window is displayed in the work area.
2. Select the "General > Text editors" group.
3. Select the "Show line numbers" option.

Show or hide the absolute operands

You can show the assignment of symbolic and absolute operands in a table next to the program code, if required.

To hide or show the display of the absolute operands, follow these steps:

1. Click the "Absolute/symbolic operands" icon in the toolbar.

   The display of the absolute operands appears.
2. To move the display, click the table and drag it to the desired position while holding down the mouse button.
3. To change the width of the table, click on the right or left table border and drag it to the right or left while holding down the mouse button.

Indenting and outdenting lines (Page 986)

Expanding and collapsing sections of code (Page 987)

Indenting and outdenting lines

Introduction

To provide a better overview of the program, lines are indented according to syntax. However, you can also manually indent individual lines.

Procedure

To indent or outdent individual lines, follow these steps:

1. Press the "Indent text", "Outdent text" button into the toolbar of the programming editor.

Note

You can set the width of the indent in "Options > Settings".

See also

Using bookmarks (Page 988)

Overview of the programming window (Page 984)

Customizing the programming window (Page 985)

Expanding and collapsing sections of code (Page 987)

Expanding and collapsing sections of code

Introduction

SCL instructions can span several lines. Examples for this are program control instructions or block calls.

These instructions are identified as follows:

- An outline view between the display line number and the program code marks the entire code section.
- When you select the opening keyword, the closing keyword is automatically highlighted.

Procedure

To expand or collapse the code section, follow these steps:

1. Click the minus sign in the outline view.

   The code section closes.
2. Click the plus sign in the outline view.

   The code section opens.

Customizing the programming window (Page 985)

Indenting and outdenting lines (Page 986)

Using bookmarks

Basics of bookmarks

Function

You can use bookmarks to mark program locations in extensive programs so that you can find them quickly later if they need revising. Bookmarks are displayed in the sidebar of the programming window. You can navigate between multiple bookmarks within a block using menu commands.

Bookmarks are saved with the project and are therefore available for anyone who wants to edit the block. However, they are not loaded to a device.

Bookmarks are not evaluated when blocks are compared.

Navigating between bookmarks (Page 989)

Deleting bookmarks (Page 989)

Setting bookmarks

Requirement

The SCL block is open.

Procedure

To set a bookmark, follow these steps:

1. Click on the desired line in the sidebar.
2. Select the "Bookmarks > Set" command in the shortcut menu.

Or:

1. Click on the desired line in the sidebar.
2. Click the "Set/delete bookmark" button in the toolbar.

Or:

1. Hold down the <Ctrl> key.
2. Click on the line in the sidebar in which you want to place the bookmark.

Result

A bookmark is placed in the program code.

Basics of bookmarks (Page 988)

Navigating between bookmarks (Page 989)

Deleting bookmarks (Page 989)

Navigating between bookmarks

Requirement

Several bookmarks are set in a block.

Procedure

To navigate between bookmarks, follow these steps:

1. Set the insertion cursor in the program code.
2. In the "Edit" menu, select the "Go to > Next bookmark" or "Go to > Previous bookmark" command.

Or:

1. Set the insertion cursor in the program code.
2. In the toolbar of the programming editor, click the "Go to next bookmark", "Go to previous bookmark" button.

Or:

1. Click in the sidebar.
2. Select the "Bookmarks > Next" or "Bookmarks > Previous" command in the shortcut menu.

Result

The line with the bookmark is highlighted.

See also

Basics of bookmarks (Page 988)

Setting bookmarks (Page 988)

Deleting bookmarks (Page 989)

Deleting bookmarks

You can delete individual bookmarks or all bookmarks from the block or the CPU.

Deleting individual bookmarks

To delete an individual bookmark, follow these steps:

1. Click on the desired line in the sidebar.
2. Select the "Bookmarks > Remove" command in the shortcut menu.

Or:

1. Click on the desired line in the sidebar.
2. In the "Edit" menu, select the "Bookmarks > Remove" command.

Or:

1. Click on the desired line in the sidebar.
2. Click the "Set/delete bookmark" button in the toolbar.

Deleting all bookmarks from the block

To delete all bookmarks from the block, follow these steps:

1. Click in the sidebar.
2. Select the "Bookmarks > Delete all from block" command in the shortcut menu.

Or:

1. In the "Edit" menu, select the "Bookmarks > Delete all from block" command.

Entering SCL instructions

Rules for SCL instructions

Instructions in SCL

SCL recognizes the following types of instructions:

- Value assignments

  Value assignments are used to assign a tag a constant value, the result of an expression or the value of another tag.
- Instructions for program control

  Instructions for program control are used to implement program branches, loops or jumps.
- Additional instructions from the "Instructions" task card

  The "Instructions" task card offers a wide selection of standard instructions that you can use in your SCL program.
- Block calls

  Block calls are used to call up subroutines that have been placed in other blocks and to further process their results.

Rules

You need to observe the following rules when entering SCL instructions:

- Instructions can span several lines.
- Each instruction ends with a semicolon (;).
- No distinction is made between upper and lower case.
- Comments serve only for documentation of the program. They do not affect the program execution.

Examples

The following examples shows the various types of instructions:

SCL

```
// Example of a value assignment
"MyTag":= 0 ;
// Example of a block call
"MyD"B."MyFB" (ParamInput:= 10) ;
// Example for a program control instruction
WHILE "Counter" < 10 DO
 "MyTAG" := "MyTag" + 2;
END_WHILE;
```

See also

Basics of SCL (Page 974)

Entering SCL instructions manually

Requirement

An SCL block is open.

Procedure

To enter SCL instructions, follow these steps:

1. Enter the syntax of the instruction using the keyboard.

   You are supported by the auto-complete function when performing this task. It offers all the instructions and operands that are allowed at the current location.
2. Select the required instruction or the desired operand from the auto-complete function.

   If you select an instruction that requires specification of operands, placeholders for the operands are inserted into the program. The placeholders for the operands are highlighted in yellow. The first placeholder is selected.
3. Replace this placeholder with an operand.
4. Use the <TAB> key to navigate to all other placeholders and replace them with operands.

Note

You can also drag-and-drop a defined operand from the PLC tag table or from the block interface into the program.

Result

The instruction is inserted.

The programming editor performs a syntax check. Incorrect entries are displayed in red and italics. In addition, you also receive a detailed error message in the inspector window.

Inserting SCL instructions using the "Instructions" task card

The "Instructions" task card offers a wide selection of instructions that you can use in your SCL program. The SCL-specific instructions for program control are available in the "Instructions" task card.

Requirement

An SCL block is open.

Procedure

To insert SCL instructions into a program using the "Instructions" task card, follow these steps:

1. Open the "Instructions" task card.
2. To insert the instruction, select one of the following steps:
   - Navigate to the SCL instruction you want to insert and drag-and-drop it to the required line in the program code. The insertion location is highlighted by a green rectangle.
   - Select the location in the program code where you want to insert the instruction and then double-click on the instruction you want to insert.

   The instruction is inserted in the program. The placeholders for the operands are highlighted in yellow. The first placeholder is selected.
3. Replace this placeholder with an operand. You can also drag a tag from the interface or the PLC tag table with drag-and-drop to the placeholder.
4. Use the <TAB> key to navigate to all other placeholders and replace them with operands.

Result

The instruction is inserted.

The programming editor performs a syntax check. Incorrect entries are displayed in red and italics. In addition, you also receive a detailed error message in the inspector window.

Using Favorites in SCL

Adding SCL instructions to the Favorites

Requirement

- A block is open.
- The multipane mode is set for the "Instructions" task card or the Favorites are also displayed in the editor.

Procedure

To add SCL instructions to the Favorites, follow these steps:

1. Open the "Instructions" task card.
2. Maximize the "Basic instructions" pane.
3. Navigate in the "Basic instructions" pane to the instruction that you want to add to the Favorites.
4. Drag-and-drop the instruction into the "Favorites" pane or into the Favorites area in the program editor.

Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

See also

Inserting SCL instructions using Favorites (Page 994)

Removing SCL instructions from the Favorites (Page 995)

Inserting SCL instructions using Favorites

Requirement

- A block is open.
- Favorites are available.

Procedure

To insert an instruction into a program using Favorites, follow these steps:

1. Drag-and-drop the desired instruction from Favorites to the desired position.

Or:

1. Select the position in the program where you want to insert the instruction.
2. In the Favorites, click on the instruction you want to insert.

Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

See also

Adding SCL instructions to the Favorites (Page 993)

Removing SCL instructions from the Favorites (Page 995)

Removing SCL instructions from the Favorites

Requirement

A code block is open.

Procedure

To remove instructions from Favorites, follow these steps:

1. Right-click on the instruction you want to remove.
2. Select the "Remove instruction" command in the shortcut menu.

Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

Inserting SCL instructions using Favorites (Page 994)

Insert block calls in SCL

Basic information on the block call in SCL

Calling function blocks

Syntax of a call

The following syntax is used to call a function block as a single or multi-instance:

```
<DB name>.<FB name> (Parameter list) //Call as a single instance
<#Instance name> (Parameter list) // Call as multi-instance
```

Calling as single instance or multi-instance

Function blocks can be called either as a single instance or a multi-instance.

- Calling as a single instance

  The called function block stores its data in a data block of its own.

- Calling as a multi-instance

  The called function block stores its data in the instance data block of the calling function block.

For additional information on the types of calls, refer to "See also".

Parameter list

If you call another code block from a SCL block, you can supply the formal parameters of the called block with actual parameters.

The specification of the parameters has the form of a value assignment. This value assignment enables you to assign values (actual parameters) to the parameters you have defined in the called block.

The formal parameters of the called code block are listed in brackets directly after the call. Input and in-out parameters have the assignment identifier ":=", output parameters have the assignment identifier "=>". A gray placeholder placed after the parameter shows the required data type and the type of the parameter.

Rules for supplying parameters

The following rules apply to supplying parameters:

- Constants, tags and expressions can be used as actual parameters.
- The assignment order is not of importance.
- The data types of formal and actual parameters must match.
- The individual assignments are separated by commas.
- If the called block has only one parameter, it is sufficient to specify the actual parameter in the brackets. The formal parameter need not be specified.

See also

Manually inserting block calls (Page 1000)

Inserting block calls with drag-and-drop (Page 1001)

Examples for calling a function block in SCL (Page 998)

Calling functions

Syntax of a call

The following syntax is used to call a function:

```
<Function name> (Parameter list);     //Standard call
<Operand>:=<Function name> (Parameter list); // Call in an
expression
```

Return value

The call options of functions depend on whether the function returns a return value to the calling block. The return value is defined at the RET_VAL parameter. If the RET_VAL parameter is of the VOID data type, then the function will not return a value to the calling block. If the RET_VAL parameter has another data type, then the function returns a return value of this data type.

All data types are permitted in SCL for the RET_VAL parameter except ANY, ARRAY and STRUCT as well as the parameter types TIMER and COUNTER.

Call options

There are two possibilities for calling functions in SCL:

- Standard call for functions with and without a return value

  With a standard call, the results of the function is made available as an output and in-out parameter.
- Call in an expression for functions with a return value

  Functions that return a return value can be used in any expression in place of an operand, for example, in a value assignment.

  The function calculates the return value, which has the same name as the function and returns it to the calling block. There the value replaces the function call.

  After the call, the results of the function will be available as return value or as an output and in-out parameter.

Parameter list

If you call another code block from a SCL block, you need to supply the formal parameters of the called block with actual parameters.

The specification of the parameters has the form of a value assignment. This value assignment enables you to assign values (actual parameters) to the parameters you have defined in the called block.

The formal parameters of the called code block are listed in brackets directly after the call. Input and in-out parameters have the assignment identifier ":=", output parameters have the assignment identifier "=>". A gray placeholder placed after the parameter shows the required data type and the type of the parameter.

Rules for supplying parameters

The following rules apply to supplying parameters to functions:

- All parameters of the function must be supplied.
- The assignment order is not of importance.
- Constants, tags and expressions can be used as actual parameters.
- The data types of formal and actual parameters must match.
- The individual assignments are separated by commas.
- If the called block has only one parameter, it is sufficient to specify the actual parameter in the brackets. The formal parameter need not be specified.
- When you call functions in SCL, you cannot use the release mechanism via EN. Use an IF statement instead to call functions conditionally.

See also

Manually inserting block calls (Page 1000)

Inserting block calls with drag-and-drop (Page 1001)

Examples for calling functions in SCL (Page 999)

Examples for calling a function block in SCL

Calling as a single instance

The following example shows the call of an FB as a single instance:

SCL

```
// Call as a single instance
"MyDB"."MyFB" (MyInput:=10, MyInout:= "Tag1");
```

Result

After the "MyFB" block is executed, the value determined for the "MyInout" in-out parameter is made available in Tag1 in the "MyDB" data block.

Calling as a multi-instance

The following example shows the call of an FB as a multi-instance:

SCL

```
// Call as a multi-instance
#MyInstance."MyFB" (MyInput:= 10, MyInout:= "Tag1") ;
```

Result

After the "MyFB" block is executed, the value determined for the "MyInout" in-out parameter is made available in "Tag1" in the data block of the calling code block.

See also

Calling function blocks (Page 995)

Manually inserting block calls (Page 1000)

Inserting block calls with drag-and-drop (Page 1001)

Examples for calling functions in SCL

Standard call

The following example shows a standard function call:

SCL

```
// Standard function call
"MyFC" (MyInput:=10, "MyInOut":= "Tag1");
```

Result

After the "MyFC" block is executed, the value determined for the "MyInOut" in-out parameter is made available in "Tag1" in the "MyFB_DB". The "Tag1" operand must be further processed in the calling block.

Call in a value assignment

The following example shows a function call in a value assignment:

SCL

```
(*Call in a value assignment, a return value was defined for "MyFC" *)
#MyOperand := "MyFC" (MyInput1:=3, MyInput2:=2, MyInput3:=8.9, MyInOut:= "Tag1") ;
```

Result

The return value will be transferred from "MyFC" to "MyOperand".

Call in an arithmetic expression

The following example shows a function call in an arithmetic expression:

```
SCL
(*Call in a mathematical expression, a return value was defined for "MyFC" *)
#MyOperand := "Tag2" + "MyFC" (MyInput1:=3, MyInput2:=2, MyInput3:=8.9)
```

Result

The return value of "MyFC" will be added to "Tag2" and the result will be transferred to "MyOperand".

Calling functions (Page 997)

Manually inserting block calls (Page 1000)

Inserting block calls with drag-and-drop (Page 1001)

Manually inserting block calls

You can insert calls for functions (FCs) and function blocks (FBs).

Inserting a call for a function (FC)

Proceed as follows to insert a function call:

1. Enter the function name.
2. Confirm your entry with the Return key.

   The syntax for the function call including the parameter list is added to the SCL program. The placeholders for the actual parameters are highlighted in yellow. The first placeholder is selected.
3. Replace this placeholder with an actual parameter. You can also drag a tag from the interface or the PLC tag table with drag-and-drop to the placeholder.
4. Use the <TAB> key to navigate to all other placeholders and replace them with actual parameters.

Inserting a call for a function block (FB)

To insert a call for a function block (FB), follow these steps:

1. Enter the name of the function block.
2. Confirm your entry with the Return key.

   The "Call options" dialog opens.
3. In the dialog, specify whether you want to call the block as a single or multi-instance.
   – If you click the "Single instance" button, in the "Name" field enter a name for the data block to be assigned to the call.
   – If you click the "Multi-instance" button, in the "Name in the interface" field enter a name of the tag with which the called function block is to be entered as a static tag in the interface of the calling block.
4. Confirm your entries with "OK".

   The syntax for the function block call including the parameter list is added to the SCL program. The placeholders for the actual parameters are highlighted in yellow. The first placeholder is selected.
5. Replace this placeholder with an actual parameter. You can also drag a tag from the interface or the PLC tag table with drag-and-drop to the placeholder.
6. Use the <TAB> key to navigate to all other placeholders and replace them with actual parameters.

Result

The block call is inserted.

If you specify an instance data block that does not exist when calling a function block, it is created.

See also

Updating block calls (Page 1003)

Basic information on the block call in SCL (Page 995)

Inserting block calls with drag-and-drop

You can insert calls for existing functions (FC) and function blocks (FB) using a drag-and-drop operation from the project tree.

Requirement

The function to be called (FC) or the function block (FB) to be called is present.

Inserting a call for a function (FC)

To insert a function call using drag-and-drop, follow these steps:

1. Drag the function from the project tree into the program.

   The syntax for the function call including the parameter list is added to the SCL program. The placeholders for the actual parameters are highlighted in yellow. The first placeholder is selected.
2. Replace this placeholder with an actual parameter. You can also drag a tag from the interface or the PLC tag table with drag-and-drop to the placeholder.
3. Use the <TAB> key to navigate to all other placeholders and replace them with actual parameters.

Inserting a call for a function block (FB)

To insert a call for a function block (FB) using drag-and-drop, follow these steps:

1. Drag the function block from the project tree and drop it into the program.

   The "Call options" dialog opens.
2. In the dialog, specify whether you want to call the block as a single or multi-instance.
   - If you click the "Single instance" button, in the "Name" field enter a name for the data block to be assigned to the call.
   - If you click the "Multi-instance" button, in the "Name in the interface" field enter a name of the tag with which the called function block is to be entered as a static tag in the interface of the calling block.
3. Confirm your entries with "OK".

   The syntax for the function block call including the parameter list is added to the SCL program. The placeholders for the actual parameters are highlighted in yellow. The first placeholder is selected.
4. Replace this placeholder with an actual parameter. You can also drag a tag from the interface or the PLC tag table with drag-and-drop to the placeholder.
5. Use the <TAB> key to navigate to all other placeholders and replace them with actual parameters.

Result

The block call is inserted.

If you specify an instance data block that does not exist when calling a function block, it is created.

See also

Updating block calls (Page 1003)

Basic information on the block call in SCL (Page 995)

Updating block calls

If interface parameters of a called block are changed, the block call can no longer be executed correctly. You can avoid such inconsistent block calls by updating the block calls.

You have two options to update the block calls:

- Explicit updating in the program editor.

  The inconsistencies within the open block are displayed and can be updated.
- Implicit updating during compilation.

  All block calls in the program as well as the used PLC data types will be updated.

Update blocks in the program editor

To update a block call within a block, follow these steps:

1. Open the block in the program editor.
2. Click "Update inconsistent block calls" in the toolbar.

   Inconsistent calls are displayed.
3. Correct the inconsistencies.

Update block calls during compilation

Proceed as follows to update all block calls and uses of PLC data types during compilation implicitly:

1. Open the project tree.
2. Select the "Program blocks" folder.
3. Select the command "Compile > Software (rebulid all blocks)" in the shortcut menu.

See also

Manually inserting block calls (Page 1000)

Inserting comments

Commenting program code

You have various options for commenting SCL programs:

- Line comment

  A comment line starts with "//" and extends to the end of the line.
- Comment section

  A comment section is introduced with "(* and completed by "*)". It can span several lines.

Inserting line comments

To insert line comments, follow these steps:

1. Type "//" at the position where you want to place the comment. This does not have to be the beginning of the line.
2. Enter the comment.

Inserting a comment section

To insert a comment section, follow these steps:

1. Type "(*" at the position where you want to place the comment. This does not have to be the beginning of the line.
2. Enter the comment.
3. Complete the comment with "*)".

Disabling one or more lines with comments

To disable program code with comments, follow these steps:

1. Select the code lines you want to disable.
2. Click the "Disable code" button in the editor.

   The line beginning "//" is inserted in the selected lines. The code that follows is interpreted as a comment. If lines already containing a line comment are disabled, "//" is inserted as well. If these lines are enabled again, the original comments are retained.

Enabling comment lines

In order to once again enable lines that have been commented out in the code, follow these steps:

1. Select the code lines you want to enable.
2. Click the "Enable code" button in the editor.

   The "//" mark for line comments at the beginning of the line is removed.

Example

The following code contains comment sections and line comments

```
(*************************************************************************************
  A description of the instructions that follow can be placed here
**************************************************************************************)
IF "MyVal1" > 0 THEN //No division by 0
    "MyReal" := "MyVal2" (* input value *) / "MyVal1" (* measured value *);
END_IF;
//Data type conversion
"MyInt" := REAL_TO_INT("MyReal");
```

Editing SCL instructions

Selecting instructions

You can select individual instructions or all instructions of a block.

Requirement

An SCL block is open.

Selecting individual instructions

To select individual instructions, follow these steps:

1. Set the insertion mark before the first character that you want to select.
2. Press and hold down the left mouse button.
3. Move the cursor to a position after the last character that you want to select.
4. Release the left mouse button.

Selecting all the instructions of a program

To select all instructions, follow these steps:

1. In the "Edit" menu, select the "Select All" command or use the keyboard shortcut <Ctrl+A>.

Note

When you select the opening keyword of an instructing, the closing keyword is automatically highlighted.

Copying, cutting and pasting instructions

Copying an instruction

To copy an instruction, follow these steps:

1. Select the instruction you want to copy.
2. Select "Copy" in the shortcut menu.

Cutting an instruction

To cut an instruction, follow these steps:

1. Select the instruction you want to cut.
2. Select the "Cut" command in the shortcut menu.

Inserting an instruction from the clipboard

To insert an instruction from the clipboard, follow these steps:

1. Copy or cut an instruction.
2. Click on the position at which you want to insert the instruction.
3. Select "Paste" in the shortcut menu.

Deleting instructions

Requirement

An SCL block is open.

Procedure

To delete an instruction, follow these steps:

1. Select the instruction you want to delete.
2. Select the "Delete" command in the shortcut menu.

Eliminating syntax errors in the program

Basic information on syntax errors

Syntax errors

Below are some examples of syntax errors:

- Missing separators or the use of too many separators
- Incorrect keyword spelling
- Incorrect jump label spelling/notation
- Notation which does not match the mnemonic set (e.g. "I 2.3" instead of "E 2.3")
- The use of key words as operands

Identification of syntax errors

Syntax errors are underlined in red or appear in red type.

This identification allows you to recognise incorrect inputs at a glance and jump from error to error to eliminate them. Syntax errors are also listed in the "Info" tab of the inspector window with an error message.

See also

Finding syntax errors in the program (Page 1008)

Finding syntax errors in the program

Procedure

To find syntax errors in the program, follow these steps:

1. Select the position in the program in which you wish to look for errors.
2. Click "Go to next error" in the toolbar.

   The first error after the position you have selected will be marked.

You can use "Go to next error" and "Go to previous error" in the toolbar to find and correct all errors in the block.

Or:

1. Open the error list in the inspector window with "Info > Syntax".

   All syntax errors are listed in the table with a short description of the error.
2. If there are any errors, click on the blue question mark next to the error text to obtain information on eliminating the problem.
3. Double-click the error you want to correct.

   The corresponding error is highlighted.

See also

Basic information on syntax errors (Page 1007)

Changing the programming language

Rules for changing the programming language

Rules

Observe the following rules if you want to change the programming language for a block:

- You can only change between the programming languages LAD, FBD and STL.
- You cannot switch blocks programmed in the programming languages SCL or GRAPH. In GRAPH blocks, however, you can change between LAD and FBD as network languages.
- If the language of individual networks of the block cannot be changed, these networks will be displayed in their original language.
- You can only change the programming language of entire blocks. The programming language cannot be changed for individual networks.
- However, you can create networks within a block using another programming language and then copy them into the desired block.

Change the programming language

Procedure

To change the programming language, follow these steps:

1. Right-click the block in the project tree.
2. Select the "Properties" command in the shortcut menu.

   The dialog with the properties of the block opens.
3. Select the "General" entry in the area navigation.
4. Select the new programming language in the "Language" drop-down list.
5. Confirm your selection with "OK".

See also

Rules for changing the programming language (Page 1008)

Handling program execution errors

Basics of error handling

Introduction

Program execution errors are programming or I/O access errors. You have a number of different options for responding to program execution errors depending on the CPU used.

Handling program execution errors in S7-300/400

You can program the program execution error OB (OB 85) for S7-300/400 CPUs. If a program execution error occurs and you do not use the program execution error OB, the CPU will switch to "STOP" mode.

You will find further information about the program execution error OB in the "Configuring devices and networks" references.

Handling program execution errors in S7-1200

You can set error handling yourself in S7-1200. This allows you to specify how the system should respond to any program execution errors that occur. The following options are available:

- You use the following system reactions provided by the operating system:
  - STOP
  - Ignore

  The system reactions are always used for handling programming errors if you do not use local error handling. If you set local error handling for a block, this has priority over the system reaction.
- You use separate local error handling. Local error handling is error handling within a block. Local error handling has the following advantages:
  - The error information is stored in the system memory, which you can query and evaluate.
  - You can use the error information to program a response in the block to the error that has occurred.
  - Programmed error evaluation and error reactions do not interrupt the program cycle.
  - The system performance is not unnecessarily burdened by the local error handling. If no errors occur, programmed error analyses and reactions are not executed.

    Local error handling applies only to blocks for which it has been set explicitly. If local error handling is set for a block, the system reaction is ignored during the execution of this block.

GetError: Get error locally (Page 1535)

GetErrorID: Get error ID locally (Page 1539)

GetError: Get error locally (Page 1363)

GetErrorID: Get error ID locally (Page 1367)

Local error handling

Principles of local error handling

Introduction

Local error handling makes it possible to query the occurrence of errors within a block and evaluate the associated error information. You can set local error handling for organization blocks (OBs), function blocks (FBs), and functions (FCs). If local error handling is enabled, the system reaction is ignored.

Local error handling applies only to blocks for which it has been set explicitly. The local error handling setting is not assumed by a calling block, nor is it transferred to called blocks. For higher-level blocks and lower-level blocks, the system settings still apply provided dedicated error handling has not been programmed for these blocks.

General procedure for local error handling

When errors occur while a block is being executed with local error handling, a predefined response is initiated based on the following error types:

- Write errors: These errors are ignored, and program execution simply continues.
- Read errors: Program execution continues with the substitute value "0".
- Execution errors: Execution of the instruction is aborted. Program execution resumes with the next instruction.

Information about the first error that occurs is stored in the system memory. This information can be queried and output with an instruction (GetError or GetErrorID). Error information is output in a format that can undergo additional processing. You can use additional instructions to analyze error information and program a reaction to the error based.

When information about the first error is queried, the error memory space in the system memory is enabled. Then, when additional errors occur, information about the next error is output.

Instructions for local error handling

You can use the following instructions for local error handling:

- GetError: Get error locally
- GetErrorID: Get error ID locally

The instructions differ in the amount of error information that is output with each one.

For additional information on the instructions, refer to "See also".

See also

GetError: Get error locally (Page 1535)

GetErrorID: Get error ID locally (Page 1367)

GetErrorID: Get error ID locally (Page 1539)

GetError: Get error locally (Page 1363)

Error output priorities

Overview of the priorities

In local error handling, information about the first error that occurred is displayed. If multiple errors occur at the same time while an instruction is being executed, these errors are displayed according to their priority. The following table shows the priority of different types of errors.

Priority	Error type
1	Error in the program code
2	Missing reference
3	Invalid range
4	DB does not exist
5	Operands are not compatible
6	Width of specified area is not sufficient
7	Timers or counters do not exist
8	No write access to a DB
9	I/O error
10	Instruction does not exist
11	Block does not exist
12	Invalid nesting depth

The highest priority is 1 and the lowest priority is 12.

GetErrorID: Get error ID locally (Page 1367)

GetErrorID: Get error ID locally (Page 1539)

GetError: Get error locally (Page 1363)

Enabling local error handling for a block

Introduction

Local error handling is enabled for a block if you insert one of the following instructions in a network.

- GetError: Get error locally
- GetErrorID: Get error ID locally

For additional information on the instructions, refer to "See also".

If local error handling is enabled for a block, the system reactions for this block are ignored.

Requirement

- The block is open.
- Die "Instructions" task card is open.

Procedure

To enable local error handling for a block, proceed as follows:

1. Navigate to the "Basic instructions" pane of the "Instructions" task card.
2. Open the "Program Control" folder.
3. Drag the instruction "Get error locally" (GetError) or "Get error ID locally" (GetErrorID) to the required network.

Result

Local error handling is enabled for the open block. In the Inspector window under "Properties > Attributes", the "Handle errors within block" check box is selected. This setting cannot be edited in the Inspector window. The local error handling can be disabled by deleting the inserted instructions to the local error handling.

9.1.4.3 Programming data blocks

Basic principles for programming of data blocks

A data block (DB) is used to save the values that are written during execution of the program.

In contrast to the code block, the data block contains only tag declarations. It contains no networks or instructions. The tag declarations define the structure of the data block.

Types of data blocks

There are two types of data blocks:

- Global data blocks

  The global data block is not assigned to a code block. You can access the values of a global data block from any code block. A global data block contains only static tags.

  The structure of the global data block can be freely defined. In the declaration table for data blocks, you declare the data elements that are to contained in the global data block.

- Instance data blocks

  The instance data block is assigned directly to a function block (FB). The structure of an instance data block cannot be freely defined, but is instead determined by the interface declaration of the function block. The instance data block contains exactly those block parameters and tags that are declared there.

  However, you can define instance-specific values in the instance data block, for example, start values for the declared tags.

PLC data types as a template for global data blocks

PLC data types can be used as templates for the creation of global data blocks with identical data structures. You create the structure as PLC data type only once and then generate the required data blocks by assigning the PLC data type.

System data types as a template for global data blocks

System data types can also be used as templates for creating global data blocks with identical data structure. System data types already have a pre-defined structure. You insert the system data type in the program only once and then generate additional data blocks with an identical structure by assigning the system data type.

Access modes

There are two different modes of accessing data values in data blocks:

- Data blocks with optimized access (only S7-1200)

  Data blocks with optimized access have no fixed defined structure. The declaration elements contain only one symbolic name in the declaration, no fixed addressing within the block. You access the data values in these block via symbolic names.

- Data blocks with standard access (all CPU families)

  Data blocks with standard access have a fixed structure. The declaration elements contain both a symbolic name in the declaration and a fixed address within the block. You can access the data values in these blocks via symbolic names or the address.

Retentivity of data values

To prevent data loss in the event of power failure, you can store the data values in a retentive memory area.

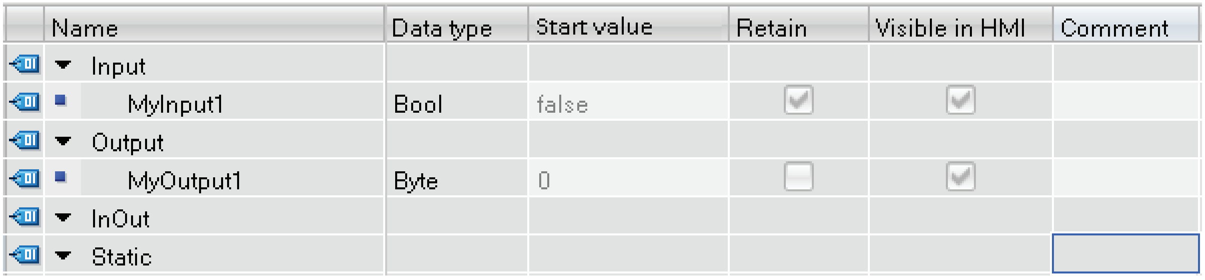
See also

Creating data blocks (Page 846)

Structure of the declaration table for data blocks

Structure of the declaration table for data blocks

The figure below shows the structure of the declaration table for data blocks. The display will vary depending on type of block and type of access.



Name	Data type	Start value	Retain	Visible in HMI	Comment
▼ Input					
MyInput1	Bool	false	☑	☑	
▼ Output					
MyOutput1	Byte	0	☐	☑	
▼ InOut					
▼ Static					

Display of instance-specific values

In instance data blocks, you can apply the already defined values from the interface of the assigned function block or define instance-specific start values. Values that are applied from the function block cannot be edited. You can replace the grayed-out values with instance-specific values. Values that were already changed instance specific are not grayed out.

Meaning of the columns

The following table shows the meaning of the individual columns: You can show or hide the columns as required.

Column	Description
🏷	Symbol you can click to move or copy the tag. You can, for example, drag-and-drop the tag into a program and use it there as operand.
Name	Name of the tags.
Data type	Data type of the tags.
Offset	Relative address of the tags. The column is only visible in data blocks with standard access.
Default value	Default value of the tag in the interface of a higher-level code block or in a PLC data type. The values contained in the "Default value" column can only be changed in the higher-level code block or PLC data type. The values are only displayed in the data block.
Start value	Value that the tag should assume at startup. The default values defined in a code block are used as start values during the creation of the data block. You can then replace these adopted values with instance-specific start values. Specification of an start value is optional. If you do not specify any value, the tag assumes the default value at startup. If a default is not defined either, the default value valid for the data type is used. For example, the value "FALSE" is specified as standard for BOOL.
Monitor value	Current data value in the CPU. This column only appears if an online connection is available and you click "Monitor".
Snapshot	Shows values that were loaded from the device.
Retain	Marks the tag as retentive. The values of retentive tags are retained even after the power supply is switched off.
Visible in HMI	Shows whether the tag is visible by default in the HMI selection list.
Accessible from HMI	Shows whether HMI can access this tag during runtime. The column is only visible on S7-1200-CPUs.
Comment	Comments to document the tags.

Creating data blocks

Requirements

The "Program blocks" folder in the project tree is open.

Procedure

To create a data block, follow these steps:

1. Double-click the "Add new block" command.

   The "Add new block" dialog box opens.
2. Click the "Data block (DB)" button.
3. Select the type of the data block. You have the following options available to you:
   - To create a global data block, select the list entry "Global DB".
   - To create an instance data block, select the function block to which you want to assign the instance data block from the list. The list contains only the function blocks that were previously created for the CPU.
   - To create a data block based on a PLC data type, select the PLC data type from the list. The list contains only the PLC data types that were previously created for the CPU.
   - To create a data block based on a system data type, select the system data type from the list. The list contains only those system data types that have already been inserted to program blocks in the CPU.
4. Enter a name for the data block.
5. Enter the properties of the new data block.
   - Select whether you want to assign the block number manually or automatically. Enter a number if you decide to use manual assignment.
   - Select the type of the block access (for S7-1200 only).
6. To enter additional properties of the new data block, click "Additional information".

   An area with further input fields is displayed.
7. Enter all the properties you require.
8. Activate the "Add new and open" check box if the block does not open as soon as it is created.
9. Confirm your entry with "OK".

Result

The new data block is created. You can find the data block in the project tree in the "Program blocks" folder.

Updating data blocks

Introduction

Changes in the interface of a function block or a PLC data type can lead to the corresponding data blocks becoming inconsistent. These inconsistencies are marked in red in the declaration table and at the call point of the block. To remedy these inconsistencies, the data blocks must be updated.

You have three options to update block calls:

- Explicit updating in the declaration table for data blocks.

  The data block is updated. Changes from the interface of the assigned function block and changes to the used PLC data types are applied.
- Explicit updating in the program editor.

  The block calls in the open block will be updated. The associated instance data block is also adjusted in the process.
- Implicit updating during compilation.

  All block calls in the program as well as the used PLC data types and the corresponding instance data blocks are updated.

Explicit Updating in the Declaration Table for Data Blocks

To explicitly update an individual data block, follow these steps:

1. Open the data block.
2. Select "Update interface" in the shortcut menu.

Explicit Updating in the Program Editor

To update all block calls or a specific call within a block, follow these steps:

1. Open the block in the program editor.
2. Right-click on the instruction with the block call.
3. Select the "Update" command in the shortcut menu.
4. The "Interface update" dialog opens. This dialog shows the differences between the block interface in use and the changed interface of the called block.
5. If you want to update the block call, click "OK". To cancel the update, click "Cancel".

Implicit Updating during Compilation

To implicitly update all block calls and uses of PLC data types as well as the instance data blocks during the compiling, follow these steps:

1. Open the project tree.
2. Select the "Program blocks" folder.
3. Select the command "Compile > Software (rebuild all blocks)" in the shortcut menu.

Changing the properties of tags in instance data blocks (Page 1029)

Creating a data structure for global data blocks

Declaring tags of elementary data type

Requirement

A global data block is open.

Note

You cannot change the structure of instance data blocks and of data blocks based on a PLC data type directly, since the structures of these blocks are defined by the respective function block or the PLC data type.

The type of the data block is entered in the block properties.

Procedure

To declare a tag of the elementary data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. In the "Data type" column, click the button for the data type selection.

   A list of the permissible data types is opened.
3. Select the desired data type.
4. Optional: Change the properties of the tags that are displayed in the other columns.
5. Repeat steps 1 to 4 for all tags that are to be declared.

See also

Displaying and editing block properties (Page 858)

Declaring tags of the ARRAY data type (Page 1020)

Declaring tags of STRUCT data type (Page 1021)

Declaring tags of the ARRAY data type

Requirement

A global data block is open.

Procedure

To declare a tag of the ARRAY data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter the "Array" data type in the "Data type" column. You will be supported by autocompletion in this step.

   The "Array" dialog opens.
3. In the "Data type" text box, specify the data type of the array elements.
4. In the "ARRAY limits" text box, specify the high and low limit for each dimension.

   Example of a one-dimensional ARRAY:

   ```
   [0..3]
   ```

   Example of a three-dimensional ARRAY:

   ```
   [0..3, 0..15, 0..33]
   ```
5. Confirm your entry.
6. Optional: Change the properties of the tags that are displayed in the other columns.

Entering start values of ARRAY elements

To set default start values for the individual elements of an ARRAY, follow these steps:

1. Click the triangle in front of the ARRAY data type tags.

   The ARRAY opens and the individual ARRAY elements are shown in separate rows.
2. Enter the required value in the "Start value" column.

Declaring tags of STRUCT data type

Requirement

A global data block is open.

Procedure

To declare a tag of the STRUCT data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter "Struct" in the "Data type" column. You will be supported by autocompletion during input.

   An empty, indented row is inserted after the new tag.
3. Insert the first structural element in the first empty row.

   An additional empty row is inserted after the element.
4. Select a data type for the structure element.
5. Optional: Change the properties of the structural element that is displayed in the other columns of the block interface.
6. Repeat the step 4 to 7 for all additional structure elements.

   It is not necessary to end the structure explicitly. The structure ends with the last element that is entered.
7. To insert a new tag after the structure, leave a blank row after the end of the structure and then start the new tag in the second empty row.

Result

The tag of STRUCT data type is created.

Enter start values of structure elements

To set default start values for the individual elements of a structure, follow these steps:

1. Click the triangle in front of the STRUCT data type tags.

   The structure opens and the individual structure elements are shown in separate rows.
2. Enter the required value in the "Start value" column.

See also

STRUCT (Page 768)

Declaring tags based on a PLC data type

Requirements

- A global data block is open.
- A PLC data type is declared in the current CPU.

Procedure

To declare a tag based on a PLC data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter the PLC data type in the "Data type" column. You will be supported by autocompletion during input.
3. Optional: Change the properties of the tags that are displayed in the other columns of the table.

Result

The tag is created.

Layout of the block interface (Page 876)

Declaring higher-level tags

Introduction

To access data areas within a declared tag, you can overlay the declared tags with an additional declaration. This provides you with the option of addressing an already declared tag with a different data type. You can, for example, address the individual bits of a tag of WORD data type with an ARRAY of BOOL.

Overlaying tags

To overlay a tag with a new data type, follow these steps:

1. Open a global data block.
2. Select the tag that you want to overlay with a new data type.
3. Click "Add row" in the toolbar.

   A row is inserted after the tag to be overlaid.
4. Enter a tag name in the "Name" column.
5. Enter the "AT" entry in the "Data type" column. You will be supported by Autocomplete in this step.

   The following is added to the entry in the "Name" column.

   ```
   "AT<Name of the higher-level tag>"
   ```
6. Click the data type selection button again and select the data type for the new tag.

   The tag is created. It points to the same data as the higher-level tag, however interprets this data with the new data type.

Removing overlay

To remove the overlay of a tag, follow these steps:

1. Select the overlaid tag that you want to remove.
2. Select the "Delete" command in the shortcut menu.

   The overlay is removed.

See also

Overlaying tags with AT (Page 731)

Define start values

Basic information on start values

Definition

The start value of a tag is a value defined by you which the tag assumes after a CPU startup.

The retentive tags have a special status. Their values take the defined start value only after a "cold restart". After a "warm restart", they retain their values and are not reset to the start value.

Default values and instance-specific start values

The structure of the data blocks can be derived from higher-level elements.

- An instance data block is based, for example, on the interface of a higher-level code block.
- A global data block can be based on a predefined PLC data type.

In this case you can define a default value for each tag in the higher-level element. These default values are used as start values during the creation of the data block. You can then replace these values with instance-specific start values in the data block.

Specification of an start value is optional. If you do not specify any value, the tag assumes the default value at startup. If a default is not defined either, the default value valid for the data type is used. For example, the value "FALSE" is specified as standard for BOOL.

See also

Define start values (Page 1024)

Declaring local tags in the block interface (Page 881)

Apply monitor values as start values (Page 1035)

Define start values

Define start values

To define the start values for the tags of a data block, follow these steps:

1. Open the data block.

   The "Default value" column shows the default values that were defined for the tags in the interface of a higher-level code block or in a PLC data type.

2. Click the "Expanded mode" button to show all elements of structured data types.
3. Enter the desired start values in the "Start value" column. The value must match the data type of the tag and should not exceed the range of the data type.

   The start values are defined. The tag takes the defined value at startup, provided it was not declared as retentive.

Resetting a tag to the default value

To reset a tag for which you have defined a start value to the default value, follow these steps:

1. Select a modified value in the table.
2. Delete the value.

   The default value is entered. The default value is displayed.

Resetting all tags to the default value

To reset to the default value all tags for which you have defined an start value, follow these steps:

1. In the shortcut menu, select "Reset start values".

Basic information on start values (Page 1023)

Apply monitor values as start values (Page 1035)

Setting retentivity

Retentivity of tags in data blocks

Retentive behavior

To prevent data loss in the event of power failure, you can mark the data as retentive. This data is stored in a retentive memory area. The options for setting the retentivity depend on the type of data block and the type of block access that is set.

See also

Setting retentivity in an instance data block (Page 1025)

Setting retentivity in a global data block (Page 1026)

Setting retentivity in an instance data block

Introduction

In an instance data block, the editability of the retentive behavior depends on the type of access of the higher-level function block:

- Function block with standard access

  You can define the instance data both as retentive or non-retentive. Individual retentivity settings are not possible for individual tags.

- Function block with optimized access

  In the instance data block, you can define the retentivity settings of the tags that are selected in the block interface with "Set in IDB". With these tags also, you cannot individually set the retentive behavior for each tag. The retentivity setting has an impact on all tags that are selected in the block interface with "Set in IDB".

Setting Retentivity for Standard Access

To centrally set the retentivity of all tags in the data block with standard access, follow these steps:

1. Open the instance data block.
2. Select the check box in the "Retain" column of a tag.

   All tags are defined as retentive.
3. To reset the retentivity setting for all tags, clear the check box in the "Retain" column of a tag.

   All tags will be defined as non-retentive.

Setting Retentivity for Optimized Access

To set the retentive behavior of the tags that are selected with "Set in IDB" in data blocks with optimized access, follow these steps:

1. Open the instance data block.
2. Select the check box in the "Retain" column of a tag.

   All tags selected with "Set in IDB" in the data block interface are defined as retentive.
3. To reset the retentivity setting for the tags, clear the check box in the "Retain" column of a tag.

   All tags selected with "Set in IDB" in the data block interface will be defined as non-retentive.

Setting retentivity in a global data block

Introduction

In a global data block, the editability of the retentive behavior depends on the type of access:

- Global data block with standard access

  You can define the data both as retentive or non-retentive. Individual retentivity settings are not possible for individual tags.
- Global data block with optimized access

  You can individually define the retentivity settings of the tags. For tags with structured data types, retentivity settings are transferred for all tag elements.

Setting Retentivity for Standard Access

To centrally set the retentivity of all tags in the data block with standard access, follow these steps:

1. Open the global data block.
2. Select the check box in the "Retain" column of a tag.

   All tags are defined as retentive.
3. To reset the retentivity setting for all tags, clear the check box in the "Retain" column of a tag.

   All tags will be defined as non-retentive.

Setting Retentivity for Optimized Access

To individually set the retentivity of all tags in data blocks with optimized access, follow these steps:

1. Open the global data block.
2. In the "Retain" column, select the check box for the tags for which you want to set a retentive behavior.

   The selected tag is defined as retentive.
3. To reset the retentivity setting for the tags, clear the check box in the "Retain" column of a tag.

   All tags selected with "Set in IDB" in the data block interface will be defined as non-retentive.

Basics of block access (Page 700)

Retentivity of tags in data blocks (Page 1025)

Editing the properties of tags in data blocks

Properties of the tags in data blocks

Properties

The following table provides an overview of the properties of tags in data blocks:

Group	Property	Description
General	Name	Name of the tags.
	Data type	Data type of the tags.
	Default value	Default value of the tag in the interface of a higher-level code block or in a PLC data type. The values contained in the "Default value" column can only be changed in the higher-level code block or PLC data type. The values are only displayed in the data block.
	Start value	Value that the tag should assume at CPU startup. The default values defined in a code block are used as start values during the creation of the data block. You can then replace these adopted values with instance-specific start values. Specification of an start value is optional. If you do not specify any value, the tag assumes the default value at startup. If a default is not defined either, the default value valid for the data type is used. For example, the value "FALSE" is specified as standard for BOOL.
	Comment	Comment on the tag.
Attributes	Retain	Marks the tag as retentive. The values of retentive tags are retained even after the power supply is switched off. This attribute is only available in the interface of the function block with optimized access.
	Visible	Indicates whether a parameter is visible in CFC.
	Can be set	Indicates whether a parameter is configurable in CFC.
	For test	Indicates whether a parameter is registered for the CFC test mode.
	Interconnectable	Indicates whether a parameter is interconnectable in CFC.

See also

Changing the properties of tags in instance data blocks (Page 1029)

Changing the properties of tags in global data blocks (Page 1030)

Changing the properties of tags in instance data blocks

Instance-specific tag properties

Two options are available for defining the tag properties:

- The tag properties are applied from the interface of the assigned function block.

  Properties that are applied from the function block are displayed grayed out out in the columns of the declaration table. The "Name" and "Data type" properties are always applied.

- You define instance-specific properties.

  You can change some properties instance specific. Changeable values are, for example, "Comment" or "Visible in HMI". Properties that were changed instance specific are not grayed out in the columns of the declaration table. The instance-specific changes are retained, even if the interface of the higher-level function block is changed and the instance data blocks are subsequently updated.

Editing properties in the declaration table

To edit the properties of one or more tags, follow these steps:

1. Open the instance data block.
2. Change the entries in the columns.

Editing properties in the properties window

To edit the properties of an individual tag, follow these steps:

1. Select a tag in the table.
2. Select the "Properties" command in the shortcut menu.

   The properties window opens. It shows the properties of the tag in the "General" and "Attributes" areas.

3. Select the required area in the area navigation.
4. Change the entries in the text boxes.

Reset individual properties to the default value.

To reset individual tag properties to the value that was defined as default in the function block, follow these steps:

1. Select an instance-specific, modified value in the table.
2. Delete the value.

   The instance-specific value will be deleted and the default value from the interface of the function block entered. The default value is displayed grayed out.

See also

Updating data blocks (Page 1018)

Properties of the tags in data blocks (Page 1028)

Changing the properties of tags in global data blocks

Introduction

Two options are available for defining the tag properties:

- The tag properties are applied from the PLC data type.

  Properties that are applied from the PLC data type are shown grayed out in the columns of the declaration table. The "Name" and "Data type" properties are always applied.

- You define specific properties.

  You can change some properties in the global data block. Changeable values are, for example, "Comment" or "Visible in HMI". Properties that were changed are not grayed out in the columns of the declaration table. The changes are retained, even if the PLC data type changes and the global data block is subsequently updated.

Editing properties in the declaration table

To edit the properties of one or more tags, follow these steps:

1. Open the global data block.
2. Change the entries in the columns.

Editing properties in the properties window

To edit the properties of an individual tag, follow these steps:

1. Select a tag in the table.
2. Select the "Properties" command in the shortcut menu.

   The properties window opens. It shows the properties of the tag in the "General" and "Attributes" areas.
3. Select the required area in the area navigation.
4. Change the entries in the text boxes.

Reset individual properties to the default value.

To reset individual tag properties to the value that was defined as default in the PLC data type, follow these steps:

1. Select a modified value in the table.
2. Delete the value.

   The default value from the PLC data type is entered. The default value is displayed grayed out.

Properties of the tags in data blocks (Page 1028)

Editing the declaration table for data blocks

Inserting table rows

Procedure

Proceed as follows to insert a row above the selected row:

1. Select the row in front of which you want to insert a new row.
2. Click the "Insert row" button on the toolbar of the table.

Result

A new row is inserted above the selected row.

Inserting table rows

Procedure

Proceed as follows to insert a row below the selected row:

1. Select the row below which you want to insert a new row.
2. Click the "Add row" button on the table toolbar.

Result

A new empty row will be inserted below the selected row.

Deleting tags

Requirements

A global data block is open.

Procedure

To delete a tag, follow these steps:

1. Select the row with the tag to be deleted. You can also select several rows by clicking on them one after the other while holding down the <Ctrl> key or by pressing and holding down <Shift> and clicking on the first and last row.
2. Select the "Delete" command in the shortcut menu.

Note

You cannot directly change the structure of instance data blocks and of global data blocks based on a PLC data type, since the structures of these blocks are defined in the higher-level object.

The type of the data block is entered in the block properties.

See also: Displaying and editing block properties (Page 858)

Automatically filling in successive cells

You can load the contents of one or several table cells into the cells below, automatically filling in the successive cells.

If you automatically fill in cells in the "Name" column, a consecutive number will be appended to each name. For example, "Motor" will become "Motor_1".

You can define individual or more cells as well as entire rows as source area.

If less rows exist in the open table than you want to fill, then you will first have to insert additional empty rows.

Requirement

- The table is open.
- Sufficient declaration rows are available.

Procedure

To automatically fill in successive cells, follow these steps:

1. Select the cells to be loaded.
2. Click the "Fill" symbol in the bottom right corner of the cell.

   The mouse pointer is transformed into a crosshair.
3. Keep the mouse button pressed and drag the mouse pointer downwards over the cells that you want to fill in automatically.
4. Release the mouse button.

   The cells are filled in automatically.
5. If entries are already present in the cells that are to be automatically filled in, a dialog appears. In this dialog you can indicate whether you want to overwrite the existing entries or insert new rows for the new tags.

Show and hide table columns

You can show or hide the columns in a table as needed.

Procedure

To show or hide table columns, follow these steps:

1. Click a column header.
2. In the shortcut menu, select the "Show/hide columns" command.

   The selection of available columns is displayed.
3. To show a column, select the column's check box.
4. To hide a column, clear the column's check box.

Editing tags with external editors

To edit individual tags in external editors outside the TIA portal, you can export or import these tags using copy & paste. However, you cannot copy structured tags to an editor.

Requirement

The data block and an external editor are opened.

Procedure

To export and re-import individual tags by drag-and-drop operation, follow these steps:

1. Select one or more tags.
2. Select "Copy" in the shortcut menu.
3. Switch to the external editor and paste the copied tags.
4. Edit the tags as required.
5. Copy the tags in the external editor.
6. Switch back to the declaration table.
7. Select "Paste" in the shortcut menu.

Monitoring data values online

Monitoring data values in data blocks online

You can monitor the current data values of the tags in the CPU directly in the declaration table.

Requirement

- An online connection is available.
- The data block has been loaded to the CPU.
- The program execution is active (CPU in "RUN").
- The data block is open.

Procedure

To monitor the data values, proceed as follows:

1. Start monitoring by clicking the "Monitor all" button.

   The additional "Monitor value" column is displayed in the table. This shows the current data values.

   See also: Structure of the declaration table for data blocks (Page 1015)
2. End the monitoring by clicking the "Monitor all" button again.

Apply monitor values as start values

You can apply the monitor values currently assigned to the tags in the CPU as start values in the data block.

Note

The values that are shown in the "Monitor value" column are always copied. During copying, it is not checked whether all values stem from the same cycle.

Requirement

- An online connection to the CPU is available.
- The data block has been loaded to the CPU.
- The program execution is active (CPU in "RUN").
- The global data block is open.

Procedure

To apply the data values as start values, follow these steps:

1. Start monitoring by clicking the "Monitor all" button.

   The "Monitor value" column is displayed in the table. This shows the current data values.
2. On the toolbar, click "Snapshot of monitored values".

   The latest monitored values will be applied in the "Snapshot" column.
3. End the monitoring by clicking the "Monitor all" button again.
4. Select a value in the "Snapshot" column.
5. Select "Copy" in the shortcut menu.
6. Select a value in the "Start value" column.
7. Select "Paste" in the shortcut menu.
8. Compile and reload the block.

Result

The values are applied as start values. The tags apply the new values at the next startup.

See also

Basic information on start values (Page 1023)

Define start values (Page 1024)

Displaying data values loaded from the device

During the loading of a data block from a device, the current tag values are also loaded. You can display these values.

Requirement

A data block was loaded from the device.

Procedure

To display the current values, follow these steps:

1. Open the data block.
2. Click a column header.
3. In the shortcut menu, select the "Show/hide columns" command.

   The selection of available columns is displayed.
4. Select the check box in the "Snapshot" column.

Result

The current values will be applied in the "Snapshot" column.

> **Note**
>
> If you subsequently change the structure of the data block, the display of the current values gets lost. The "Snapshot" column will then be empty.

9.1.4.4 Programming PLC data types

Basics of PLC data types

Description

PLC data types are data structures that you define and that can be used multiple times within the program. The structure of a PLC is made up of several components, each of which can contain different data types. You define the type of components during the declaration of the PLC data type.

PLC data types can be used for the following applications:

- PLC data types can be used as data types for variables in the variable declaration of logic blocks or in data blocks.
- PLC data types can be used as templates for the creation of global data blocks with identical data structures.

See also

Creating PLC data types (Page 1038)

Structure of the declaration table for PLC data types

Structure of the declaration table for PLC data types

The figure below shows the structure of the declaration table for PLC data types.

	Name	Data type	Default value	Visible in HMI	Comment
◁	Motor	Bool	false	☑	
◁	▾ MyTag1	Struct		☑	
◁	▪ Element1	Bool	false	☑	
◁	▪ Element2	Bool	false	☑	
◁	MyTag2	Bool	false	☑	

Meaning of the columns

The following table shows the meaning of the individual columns: You can show or hide the columns as required.

Column	Description
◁	Symbol you can click to move or copy the tag.
Name	Name of the tags.
Data type	Data type of the tags.
Default value	Value with which you predefine the tag in the declaration of the PLC data type. Specification of the default value is optional. If you do not specify any value the predefined value for the indicated data type is used. For example, the value "false" is predefined for BOOL.
Visible in HMI	Shows whether the tag is visible by default in the HMI selection list.
Accessible from HMI	Shows whether HMI can access this tag during runtime. The column is only visible on S7-1200-CPUs.
Comment	Comments to document the tags.

Creating PLC data types (Page 1038)

Show and hide table columns (Page 1047)

Creating PLC data types

Requirement

The "PLC data types" folder opens in the project tree.

Procedure

To create a PLC data type, proceed as follows:

1. In the "PLC data types" folder, click the "Add new data type" command.

   A new declaration table for creating a PLC data type will be created and opened.
2. Select the PLC data type and select the "Rename" command in the shortcut menu.
3. Enter the name of the PLC data type.

Result

The new PLC data type is created. You can find the PLC data type in the project tree in the "PLC data types" folder.

See also

Structure of the declaration table for PLC data types (Page 1037)

Basics of PLC data types (Page 1036)

Delete PLC data types

Requirement

The PLC data type you want to delete is not open.

Procedure

To delete a PLC data type, follow these steps:

1. In the project tree, open the "PLC data types" folder.
2. Select the PLC data type to be deleted. You can also select several PLC data types by clicking on them one after the other while holding down the <Ctrl> key or by pressing and holding down <Shift> and clicking on the first and last data type.
3. Select the "Delete" command in the shortcut menu.

Note

If you delete a PLC data type, the blocks that use the data type will become inconsistent. These inconsistencies are marked in red in the block used. To remedy these inconsistencies, the data blocks have to be updated.

Updating the block interface (Page 888)

Updating data blocks (Page 1018)

Programming the structure of PLC data types

Declaring tags of elementary data type

Requirement

A PLC data type is open.

Procedure

To declare a tag, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter the required data type in the "Data type" column. You will be supported by autocompletion during input.
3. Optional: Change the properties of the tags that are displayed in the other columns.
4. Repeat steps 1 to 3 for all tags that are to be declared.

Declaring tags of the ARRAY data type

Requirement

A PLC data type is open.

Procedure

To declare a tag of the ARRAY data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter the "Array" data type in the "Data type" column. You will be supported by autocompletion in this step.

   The "Array" dialog opens.
3. In the "Data type" text box, specify the data type of the array elements.
4. In the "ARRAY limits" text box, specify the high and low limit for each dimension.

   Example of a one-dimensional ARRAY:

   ```
   [0..3]
   ```

   Example of a three-dimensional ARRAY:

   ```
   [0..3, 0..15, 0..33]
   ```
5. Confirm your entry.
6. Optional: Change the properties of the tags that are displayed in the other columns.

Note

You cannot define specific default values for ARRAY elements. You can, however, assign them start values at the usage point in the data block.

See also

Structure of the declaration table for PLC data types (Page 1037)

Declaring tags of STRUCT data type

Requirements

A PLC data type is open.

Procedure

To declare a tag of the STRUCT data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter "Struct" in the "Data type" column. You will be supported by autocompletion during input.

   An empty, indented row is inserted after the new tag.
3. Insert the first structural element in the first empty row.

   An additional empty row is inserted after the element.
4. Select a data type for the structure element.
5. Optional: Change the properties of the structural element that is displayed in the other columns.
6. Repeat steps 3 to 5 for all additional structure elements.

   It is not necessary to end the structure explicitly. The structure ends with the last element that is entered.
7. To insert a new tag after the structure, leave a blank row after the end of the structure and then start the new tag in the second empty row.

Result

The tag of STRUCT data type is created.

See also

STRUCT (Page 768)

Structure of the declaration table for PLC data types (Page 1037)

Declaring tags based on a different PLC data type

Requirements

- A global data block is open.
- A PLC data type is declared in the current CPU.

Procedure

To declare a tag based on a different PLC data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter the PLC data type in the "Data type" column. You will be supported by autocompletion during input.

Result

The tag is created.

Note

You define the default values of tags within a PLC data type when the PLC data type is created. You cannot change these values at the point of use of the PLC data type.

See also

Basics of PLC data types (Page 1036)

Structure of the declaration table for PLC data types (Page 1037)

Declaring higher-level tags

Introduction

To access data areas within a declared tag, you can overlay the declared tags with an additional declaration. This provides you with the option of addressing an already declared tag with a different data type. You can, for example, address the individual bits of a tag of WORD data type with an ARRAY of BOOL.

Overlaying tags

To overlay a tag with a new data type, follow these steps:

1. Open the PLC data type.
2. Select the tag that you want to overlay with a new data type.
3. Click "Add row" in the toolbar.

   A row is inserted after the tag to be overlaid.
4. Enter a tag name in the "Name" column.
5. Enter the "AT" entry in the "Data type" column. You will be supported by Autocomplete in this step.

   The following is added to the entry in the "Name" column.

   ```
   "AT<Name of the higher-level tag>"
   ```
6. Click the data type selection button again and select the data type for the new tag.

   The tag is created. It points to the same data as the higher-level tag, however interprets this data with the new data type.

Removing overlay

To remove the overlay of a tag, follow these steps:

1. Select the overlaid tag that you want to remove.
2. Select the "Delete" command in the shortcut menu.
3. The overlay is removed.

See also

Overlaying tags with AT (Page 731)

Editing tag properties in PLC data types

Properties of tags in PLC data types

Properties

The following table gives an overview of tag properties in PLC data types:

Group	Property	Description
General	Name	Name of the tags.
	Data type	Data type of the tags.
	Default value	Default value of the tag in the interface of a higher-level code block or in a PLC data type. The values contained in the "Default value" column can only be changed in the higher-level code block or PLC data type. The values are only displayed in the data block.
	Start value	Not relevant in PLC data types
	Comment	Comment on the tag.
Attributes	Retain	Not relevant in PLC data types
	Visible	Indicates whether a parameter is visible in CFC.
	Can be set	Indicates whether a parameter is configurable in CFC.
	For test	Indicates whether a parameter is registered for the CFC test mode.
	Interconnectable	Indicates whether a parameter is interconnectable in CFC.

Structure of the declaration table for PLC data types (Page 1037)

Changing the properties of tags in PLC data types

Editing general properties in the declaration table

To edit the general properties of one or more tags, follow these steps:

1. Open the PLC data type.
2. Change the entries in the columns.

Editing detailed properties in the properties window

To edit the detailed properties of an individual tag, follow these steps:

1. Select a tag in the table.
2. Select the "Properties" command in the shortcut menu.

   The inspector window shows the properties of the tag in the "General" and "Attributes" areas.
3. Select the required area in the area navigation.
4. Change the entries in the text boxes.

Updating the block interface (Page 888)

Updating data blocks (Page 1018)

Editing the declaration table for PLC data types

Inserting table rows

Procedure

Proceed as follows to insert a row above the selected row:

1. Select the row in front of which you want to insert a new row.
2. Click the "Insert row" button on the toolbar of the table.

Result

A new row is inserted above the selected row.

Inserting table rows

Procedure

Proceed as follows to insert a row below the selected row:

1. Select the row below which you want to insert a new row.
2. Click the "Add row" button on the table toolbar.

Result

A new empty row will be inserted below the selected row.

Deleting tags

Procedure

To delete a tag, follow these steps:

1. Select the row with the tag to be deleted. You can also select several rows by clicking on them one after the other while holding down the <Ctrl> key or by pressing and holding down <Shift> and clicking on the first and last row.
2. Select the "Delete" command in the shortcut menu.

Automatically filling in successive cells

You can load the contents of one or several table cells into the cells below, automatically filling in the successive cells.

If you automatically fill in cells in the "Name" column, a consecutive number will be appended to each name. For example, "Motor" will become "Motor_1".

You can define individual or more cells as well as entire rows as source area.

If less rows exist in the open table than you want to fill, then you will first have to insert additional empty rows.

Requirement

- The table is open.
- Sufficient declaration rows are available.

Procedure

To automatically fill in successive cells, follow these steps:

1. Select the cells to be loaded.
2. Click the "Fill" symbol in the bottom right corner of the cell.

   The mouse pointer is transformed into a crosshair.
3. Keep the mouse button pressed and drag the mouse pointer downwards over the cells that you want to fill in automatically.
4. Release the mouse button.

   The cells are filled in automatically.
5. If entries are already present in the cells that are to be automatically filled in, a dialog appears. In this dialog you can indicate whether you want to overwrite the existing entries or insert new rows for the new tags.

Show and hide table columns

You can show or hide the columns in a table as needed.

Procedure

To show or hide table columns, follow these steps:

1. Click a column header.
2. In the shortcut menu, select the "Show/hide columns" command.

   The selection of available columns is displayed.
3. To show a column, select the column's check box.
4. To hide a column, clear the column's check box.

9.1.4.5 Using external source files

Basics of using external source files

Function

The textual programming languages STL and SCL allow you to enter the program code in any ASCII editor and save it as an external source file. This enables you to perform a range of tasks, for example:

- Declaring tags
- Specify block properties
- Programming blocks
- Specifying system attributes for messages

You can import these source files to your project and use them to generate blocks. You can generate a number of different blocks from one source file.

You also have the option of saving existing blocks as external source files.

See also

Rules for programming external source files (Page 1048)

Saving blocks as external source files (Page 1049)

Inserting external source files (Page 1049)

Opening and editing external source files (Page 1050)

Generating blocks from external source files (Page 1051)

Rules for programming external source files

An external source file basically consists of continuous text. To compile the source into blocks, certain structures and syntax rules must however be adhered to.

Rules

The syntax of the instructions in external source files is very similar to that in the creation of user programs in the program editor with STL or SCL. Note, however, the following additional syntax rules:

- Block call

  When calling a block, transfer the parameters in the defined order in the ASCII editor. If you do not, the comment assignments for these lines may not match.

  Enter the parameters in brackets. The individual parameters are separated by a comma.

- Upper or lower case

  The program editor generally disregards upper or lower case. Jump labels are an exception to this. Character string entries are also case-sensitive ("STRING" data type). Keywords are displayed in upper case. For compilation purposes, however, case is disregarded; you can therefore specify keywords in upper or lower case or a mixture of the two.

- Semicolon

  Mark the end of every instruction and every tag declaration with a semicolon. You can enter several instructions per line.

- Forward slashes

  Begin every comment with two forward slashes (//) and end the comment with the <Enter> key.

Basics of using external source files (Page 1047)

Saving blocks as external source files (Page 1049)

Inserting external source files (Page 1049)

Opening and editing external source files (Page 1050)

Generating blocks from external source files (Page 1051)

Saving blocks as external source files

Procedure

To export a block to an external source file, follow these steps:

1. In the project tree, right-click on the block you want to export to an external source file.
2. Select the "Copy as text" command in the shortcut menu.
3. Open an external text editor.
4. Paste the copied text from the clipboard.
5. Save the file with one of the following file name extensions:
   - ".scl" if you wish to generate a source file for SCL
   - ".stl" if you wish to generate a source file for STL

Result

The block has been saved as an external source file. You can include this source file in a project in the TIA portal and use it to generate other blocks. Please note, however, that you can only use STL source files in S7-300/400 CPUs.

See also

Basics of using external source files (Page 1047)

Inserting external source files (Page 1049)

Opening and editing external source files (Page 1050)

Generating blocks from external source files (Page 1051)

Inserting external source files

Requirement

- An external source file is available and complies with the syntax and structure rules.
- The "External source files" folder is open in the project tree.

Procedure

Follow these steps to insert an external source file:

1. Double-click on the "Add new external file" command.

   The "Open" dialog box is opened.
2. Navigate to and select existing external source files.
3. Confirm your selection with "Open".

Result

The new source file will be added to the "External source files" folder.

See also

Basics of using external source files (Page 1047)

Rules for programming external source files (Page 1048)

Saving blocks as external source files (Page 1049)

Opening and editing external source files (Page 1050)

Generating blocks from external source files (Page 1051)

Opening and editing external source files

By linking the files with the file name extensions "stl" and "scl" to an editor you will be able to open and edit external source files with these formats directly.

This means you do not need to insert the external source files again after editing.

Linking files with the file name extensions "stl" and "scl" file types to an editor

Proceed as follows to link files with the file name extensions "stl" and "scl" to an editor:

1. Open Windows Explorer.
2. Right-click on an STL file.
3. Select "Properties" in the shortcut menu.

   The "Properties" dialog box opens.
4. Click "Change" in the "File type" area on the "General" tab.

   The "Open with" dialog box opens.
5. Select the text editor you want to link to the "stl" file type.
6. Confirm your selection with "OK".
7. Close the "Properties" dialog with "OK".
8. Repeat steps 2 to 7 with an SCL file.

Opening and editing an external source file

To open an external source file, follow these steps:

1. Open the "External source files" folder in the project tree.
2. Double-click on the external source file you want to open.

   The external source file will open in the linked editor and can be edited.

Saving blocks as external source files (Page 1049)

Inserting external source files (Page 1049)

Generating blocks from external source files (Page 1051)

Generating blocks from external source files

Requirement

- The "External source files" folder is open in the project tree.
- An external source file is available.

Procedure

To generate blocks from an external source file, follow these steps:

1. Open the external source file from which you wish to generate blocks.
2. Select the "Generate blocks" command in the "Edit" menu.
3. A prompt will appear telling you any existing blocks will be overwritten.
4. Confirm the safety prompt with "Yes".

Result

The external source file blocks will be generated and inserted in the "Program blocks" folder in the project tree. In the event of errors, information about the errors which have occurred will be displayed in the inspector window. This information, however, relates to the external source file and not to the block generated.

9.1.5 Comparing project data

9.1.5.1 Basics of comparing project data

Introduction to comparing project data

Function

You can compare the following objects to establish any differences:

- Code blocks with other code blocks
- Data blocks with other data blocks
- PLC tag tables with other PCL tag tables
- PLC tags of a PLC tag table with the PLC tags of another PLC tag table
- PLC data types with other PLC data types
- Tags of a PLC data type with the tags of another PLC data type

Devices and the folder "Program blocks" act as starting points for the comparison. You must start a comparison at one of these starting points. The comparison will cover all underlying objects.

Types and levels of comparison

Two different basic types of comparison can be used:

- Online/offline comparison:

  The objects in the project are compared with the objects of the corresponding device. An online connection to the device is necessary for this comparison. With an Online/Offline comparison you can compare only code and data blocks.
- Offline/offline comparison:

  The objects of two devices either within a project or from various different projects are compared. No online connection is required for this comparison.

Please note that you cannot carry out an unlimited number of comparisons at the same time. The limit is one comparison for each type (online/offline or offline/offline) and for each starting point (device or "Program blocks" folder).

You can choose between the following levels of comparison depending on how in-depth an object comparison you require:

- Comparison editor
- Detailed comparison

When you start a comparison, you will first receive an overview in the comparison editor. For some comparison objects, you can then start a detailed comparison in which the objects compared will be opened side-by-side, each in its own program editor instance. Any differences will be highlighted.

The table below gives an overview of the types and levels of comparison you can apply for each object:

Object	Online/offline		Offline/offline	
	Comparison editor	Detailed comparison	Comparison editor	Detailed comparison
LAD block	X	X	X	X
FBD block	X	X	X	X
STL block	X	X	X	X
LAD block	X	S7-1200 V2 only	X	X
GRAPH block	X	-	X	-
Global data block	X	X	X	X
Instance data block	X	X	X	X
PLC tag table	-	-	X	-
PLC data type	-	-	X	-
Legend: X: available -: not available				

Note

You cannot perform a detailed comparison for know-how protected blocks.

Comparison of code blocks (Page 1054)

Comparison of data blocks (Page 1055)

Comparing PLC tag tables and PCL data types (Page 1055)

Carrying out an online/offline comparison (Page 1056)

Carrying out offline/offline comparisons (Page 1057)

Comparison of code blocks

Introduction

The blocks to be compared in a code block comparison are assigned for comparison on the basis of the following criteria:

- Online/offline comparison: Addresses, e.g. FB100
- Offline/offline comparison: Symbolic names of the blocks

The comparison involves an evaluation of the block time stamps. The results are displayed as an overview in the comparison editor. You can then use actions to define what is to be done about the differences. You can also start detailed comparisons for the individual blocks. The versions of a block compared are opened beside each other and the differences are highlighted.

For the comparison of code blocks, both the block interfaces and the individual networks are compared. Any differing tag names are also determined. All comments and other block attributes are excluded from the comparison.

If the block interface changes, the time stamp of the code block interface will also change. This change means a change in the time stamp of the program code. The first step in comparing block interfaces is therefore a comparison of the program code time stamps. If these time stamps are the same, it is assumed that the interfaces are the same. If the time stamps of the interfaces differ, the next step is to compare the data types of the interfaces, section by section. Multi-instances and PLC data types are included in the comparison. If the data types in the sections are the same, the start values of the tags are compared. All differences are displayed.

When networks are compared, first inserted or deleted networks are detected. Then the other networks are compared. Instructions are the same if the operator and operand are the same. The first difference in each instruction is displayed. However, several differences per network can be displayed.

Introduction to comparing project data (Page 1052)

Comparison of data blocks (Page 1055)

Comparing PLC tag tables and PCL data types (Page 1055)

Carrying out an online/offline comparison (Page 1056)

Carrying out offline/offline comparisons (Page 1057)

Comparison of data blocks

Introduction

The blocks to be compared in a data block comparison are assigned for comparison on the basis of the following criteria:

- Online/offline comparison: Addresses, e.g. DB100
- Offline/offline comparison: Symbolic names of the blocks

The first step in data block comparison is comparing the time stamps of the data block. If these time stamps are the same, it is assumed that the data structures are the same. If the time stamps differ, the structures are then compared until the first difference is found. If the data structures in the sections are the same, the initial and current values of the tags are then compared. All differences are displayed. Any differing tag names are also determined. Comments and PLC data type structures used in the data block are not included in the comparison.

Comparing PLC tag tables and PCL data types (Page 1055)

Carrying out an online/offline comparison (Page 1056)

Carrying out offline/offline comparisons (Page 1057)

Comparing PLC tag tables and PCL data types

Introduction

The device PLC tag tables and the device PLC data types will also be shown in the comparison editor if you carry out an offline/offline comparison. The PLC tag tables and the PLC data types will be matched by name and you will receive the following information:

- Status: A symbol shows whether the PLC tag tables / PLC data types are identical or differ.
- Missing PLC tag tables / PLC data types: You can see at a glance whether the PLC tag tables / PLC data types are available in both devices.
- Number of tags: The number of tags each PLC tag table contains is displayed.

You cannot define actions for PLC tag tables and PLC data types.

Comparison of data blocks (Page 1055)

Carrying out an online/offline comparison (Page 1056)

Carrying out offline/offline comparisons (Page 1057)

9.1.5.2 Carrying out an online/offline comparison

Requirement

The project tree is open.

Procedure

To perform an online-offline comparison, follow these steps:

1. Select a device in the project tree.
2. Select the "Compare > Offline/online" command in the shortcut menu.
   - If you have already started a comparison of this type for the device selected and would like to replace this comparison with the new comparison, confirm the message which appears by clicking on "Yes". If you click on "No", the new comparison will be cancelled.
   - If you have not yet established an online connection, the "Go online" dialog opens. If the online connection has already been defined, the comparison editor opens.

Result

All objects that exist online and offline are displayed. The symbols in the comparison editor and in the project tree show you the status of the objects. You can now define the actions you require for the objects or start detailed comparisons.

See also

Carrying out offline/offline comparisons (Page 1057)

9.1.5.3 Carrying out offline/offline comparisons

Requirement

The project tree is open.

Comparing the blocks of two different devices in the same project

To compare the blocks of two devices within a project, follow these steps:

1. Select a device or the folder "Program blocks" in the project tree.
2. Select the "Compare > Offline/offline" command in the shortcut menu.

   If you have already started a comparison for this comparison type, a message is displayed. To replace the previous comparison with the new comparison, acknowledge the message shown with "Yes". The "Offline/offline comparison" dialog will open. If you click on "No", the new comparison will be cancelled.
3. Click on the "Device in this project" button.

   The devices available in the project will be listed.
4. Select the device with which you wish to carry out the comparison.
5. Click "OK."

   The comparison editor will open and symbols will show the results of the offline-offline comparison.

Comparing the blocks of two different devices from two different projects

To compare the blocks of two devices from different projects, follow these steps:

1. Select a device or the folder "Program blocks" in the project tree.
2. Select the "Compare > Offline/offline" command in the shortcut menu.

   If you have already started a comparison for this comparison type, a message is displayed. To replace the previous comparison with the new comparison, acknowledge the message shown with "Yes". The "Offline/offline comparison" dialog will open. If you click on "No", the new comparison will be cancelled.
3. Click on the "Device in another project" button.
4. Enter the project with which you wish to carry out the comparison or select it by clicking on the "Browse" button.

   The devices available in the project selected will be listed.
5. Select the device with which you wish to carry out the comparison.
6. Click "OK."

   The comparison editor will open and symbols will show the results of the offline-offline comparison.

Comparing PLC tags

To compare the PLC tags of two PLC tag tables, follow these steps:

1. Select a device in the project tree.
2. Select the "Compare > Offline/offline" command in the shortcut menu.

   If you have already started a comparison for this comparison type, a message is displayed. To replace the previous comparison with the new comparison, acknowledge the message shown with "Yes". The "Offline/offline comparison" dialog will open. If you click on "No", the new comparison will be cancelled.
3. Specify the project with which you wish to carry out the comparison.
4. Select the device with which you wish to carry out the comparison.
5. Click "OK."

   The comparison editor opens and symbols show the results of the offline-offline comparison of the PLC tag table.
6. Double-click on the PLC tag table to compare the individual PLC tags in the table with the PLC tags of the PLC tag table which have the same names as the comparison device.

   The individual tags in the PLC tag table are listed and the existing differences between each tag and the PLC tags in the same PLC tag table in the other device are displayed. For each PLC tag you can set an action to be executed at synchronization.

Comparing PLC data types

To compare the PLC data types of two devices, follow these steps:

1. Select a device in the project tree.
2. Select the "Compare > Offline/offline" command in the shortcut menu.

   If you have already started a comparison for this comparison type, a message is displayed. To replace the previous comparison with the new comparison, acknowledge the message shown with "Yes". The "Offline/offline comparison" dialog will open. If you click on "No", the new comparison will be cancelled.
3. Specify the project with which you wish to carry out the comparison.
4. Select the device with which you wish to carry out the comparison.
5. Click "OK."

   The comparison editor opens and symbols show the results of the offline-offline comparison of the PLC data types for the devices.
6. Double-click on the PLC data type to compare the tags of the PLC data type with the tags of the PLC data type which have the same names as the comparison device.

   The tags of the PLC data types are listed and the existing differences to the tags of the same PLC data type in the other device are displayed. For each tag you can set an action to be executed at synchronization.

Carrying out an online/offline comparison (Page 1056)

9.1.5.4 Using the comparison editor

Overview of the comparison editor

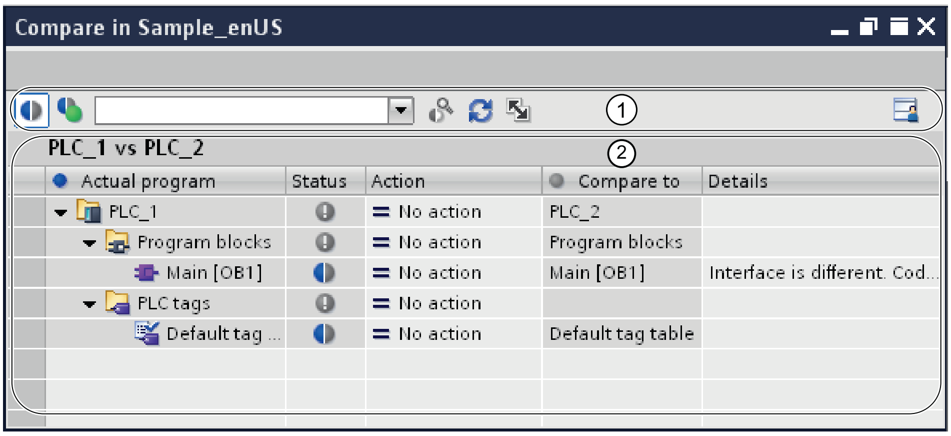
Function

The comparison editor gives an overview of the results of online/offline and offline/offline comparisons in a table. You can also define which actions are to be carried out for non-identical objects compared.

Please note that you cannot carry out an unlimited number of comparisons at the same time. The limit is one comparison for each type (online/offline or offline/offline) and for each starting point (device or "Program block" folder).

Components of the comparison editor

The following figure shows the components of the comparison editor using an offline/offline comparison as an example:



PLC_1 vs PLC_2

● Actual program	Status	Action	● Compare to	Details
PLC_1	!	= No action	PLC_2	
Program blocks	!	= No action	Program blocks	
Main [OB1]	◐	= No action	Main [OB1]	Interface is different. Cod...
PLC tags	!	= No action		
Default tag ...	◐	= No action	Default tag table	

① Comparison editor toolbar

② Tabular comparison overview

Comparison editor toolbar

With the toolbar, you can access the following comparison editor functions:

- Showing and hiding identical objects

  You can hide identical objects to make the comparison easier to follow.

- Scope of the comparison

  You can define which blocks are to be compared.

- Start detailed comparison

  You can start a detailed comparison for objects to show the individual differences. This function is, however, not available for every object.

- Refresh the view

  After you have modified objects, you can update the view of the comparison editor with this function.

- Execute action

  You can synchronize non-identical objects using specific comparison actions.

Comparison editor columns

The following table sets out the meaning of the columns in the comparison editor:

Column	Description
Actual program	Program selected for comparison which is compared with an offline or online version of the program.
Status	Result of the comparison, indicated by symbols
Action	Action for synchronization
Description	Description of the selected action
Compare to	Offline or online version of the program used for comparison.
Path	Path to the comparison object
Details	Details of current differences

Not all columns are shown in the default setting. You can, however, show or hide the columns as required as in all table editors.

Comparison editor symbols

The results of the comparison are indicated by symbols.

The following table shows the comparison results symbols for an online/offline comparison:

Symbol	Description
!	Folder contains objects whose online and offline versions differ
?	Comparison results are not known

Symbol	Description
🟩	Online and offline versions of the object are identical
●	Online and offline versions of the object are different
◐	Object only exists offline
◑	Object only exists online

The following table shows the comparison results symbols for an offline/offline comparison:

Symbol	Description
●	Actual program
○	Version compared
❗	Folder contains objects of which the versions compared differ
❓	Results of the offline/offline comparison are not known
🟩	The versions of the object compared are identical
●	The versions of the object compared differ
◐	Object only exists in the output program
◑	Object only exists in the version compared

The following table shows the symbols for possible actions:

Symbol	Description
⏸	No action
→	Overwrite the object of the compared version with the object from the output program
←	Overwrite the object of the output program with the object from the compared version
⇄	Different actions for the comparison objects in the folder

Filtering the comparison editor view (Page 1062)

Updating the comparison results (Page 1063)

Filtering the comparison editor view

You can improve the clarity of the comparison editor using the following filters:

- Hiding identical comparison objects

  You can hide comparison objects which have identical online/offline or offline/offline versions. Any such comparison objects you have hidden can also be shown again at any time.

- Block type shown

  You can define the blocks whose comparison results are to be shown.

Requirement

The comparison editor is open.

Hiding identical comparison objects

To hide identical objects, follow these steps:

1. Click on the "Show only objects with differences" button in the toolbar.

   Only the elements that differ online and offline are displayed.

Showing identical comparison objects

To show identical objects again, follow these steps:

1. Click on the "Show identical and different objects" button in the toolbar.

   All elements will be displayed.

Selecting block type to be shown

To select the block type whose comparison results are to be shown, follow these steps:

1. Click on the arrow button in the drop-down list in the toolbar.
2. Select the block type you want.

See also

Carrying out an online/offline comparison (Page 1056)

Carrying out offline/offline comparisons (Page 1057)

Overview of the comparison editor (Page 1059)

Updating the comparison results (Page 1063)

Updating the comparison results

As soon as you change an object, the comparison results are no longer valid and must be updated.

Note

For online/offline comparisons, you should note that changes in the device may result in the system automatically updating the comparison editor if objects in the comparison are affected by the change. This can have the following results:

- Some of the actions you have defined may become invalid, for example if the device no longer contains the object in question. Objects with such invalid actions will be highlighted so you can define new, valid actions.
- The selection you made before the automatic update may also be cancelled.

Requirement

The comparison editor is open.

Procedure

To update the comparison results, follow these steps:

1. Click the "Refresh view" button in the toolbar.

   The comparison results are updated.

   Note

   Please note that the "Refresh view" button will not be available while the comparison editor is loading or synchronizing content.

Synchronizing non-identical objects

Specifying actions

If you have performed a comparison, you can specify the actions to be performed for non-identical objects in the comparison editor. You cannot select any actions for identical objects.

Note

Please note the following CPU-specific aspects when defining actions:

- S7-300/400:
  - You can define actions for the "Program blocks" folder, for folders you have created and for individual blocks.
  - Neither SCL nor GRAPH blocks can be loaded from the device to the offline project.
- S7-1200:
  - You can only define actions at a CPU level. This means that the action you define for the CPU will be performed on all underlying objects.
  - SCL blocks cannot be loaded from the device to the offline project.

Requirement

The comparison editor is open.

Procedure

To select an action for a non-identical object, follow these steps:

1. Click on the arrow button in the drop-down list in the "Action" column.
2. Select the action you want.

   The action set will be carried out for the object in question the next time synchronization is performed.

   If you have accidentally changed the action you had selected, you can undo the change before the next synchronization. The shortcut menu is only available for folders if the same actions have been set for all objects in those folders.
3. To restore the previous action selected, right-click on the object or folder.
4. Select the "Restore previous selection" command in the shortcut menu.

Updating the comparison results (Page 1063)

Synchronizing objects (Page 1065)

Synchronizing objects

Synchronization executes the actions you have specified for non-identical objects.

Requirement

- The comparison editor is open.
- The desired actions have been selected.

Procedure

To synchronize objects, follow these steps:

1. Click the "Execute actions" button in the toolbar.

Result

The actions you specified for the objects are performed.

Specifying actions (Page 1064)

9.1.5.5 Performing detailed block comparisons

Starting a detailed comparison

You can start a detailed comparison for blocks. The versions of a block compared are opened beside each other and the differences highlighted.

Note

Please note the following:

- You cannot carry out detailed comparisons of blocks created in the GRAPH programming language.
- You can carry out detailed comparisons for S7-300/400 and S7-1200 V2 for blocks created in the SCL programming language.

Starting detailed comparisons using the comparison editor

To start a detailed comparison for a block using the comparison editor, follow these steps:

1. In the comparison editor, right-click on the block for which you want to perform a detailed comparison.
2. Click on the "Show details on selected object" button in the toolbar.

Starting detailed comparisons in the program editor

To start a detailed comparison for a block in the program editor, follow these steps:

1. Open the block for which you wish to carry out a detailed comparison.
2. Click the "Detailed comparison" button in the toolbar.

Result

One instance of the program editor will be opened for each version of the block compared and the two instances will be displayed side by side. Any differences will be highlighted in color in each version.

Navigating in the detailed comparison (Page 1069)

Changing blocks during detailed comparison (Page 1070)

Updating comparison results (Page 1071)

Representation of the detailed comparison

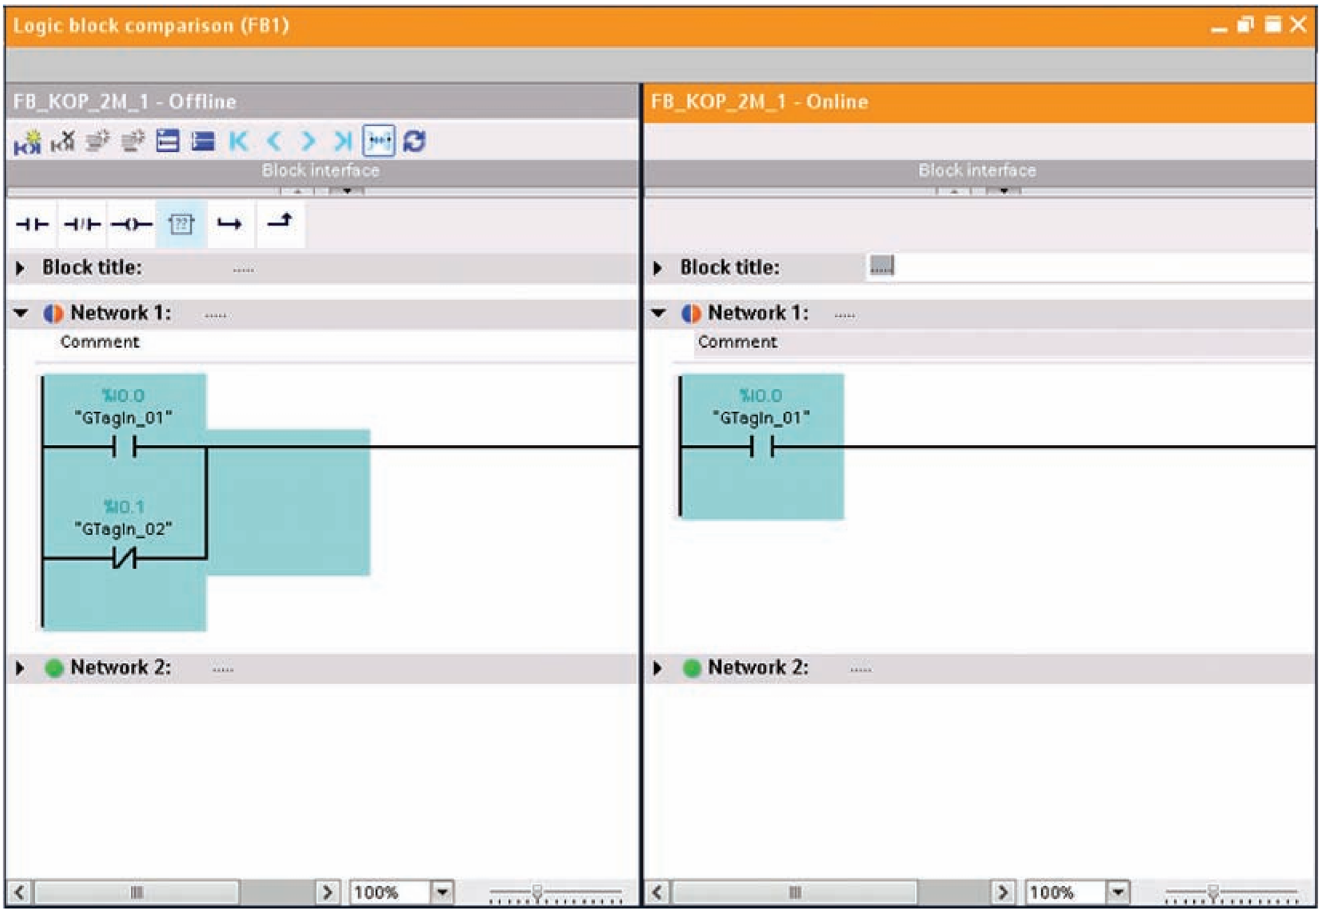
Identification of the differences

The detailed comparison allows you to identify the exact places where versions of a block differ. The following color coding allows you to find these places as quickly as possible:

- The lines where there are differences are highlighted in gray.
- Differing operands and instructions are highlighted in green.
- If the number of networks differs, pseudo-networks are added to allow the display of identical networks to be synchronized. These pseudo-networks are highlighted in grey and contain the text "No corresponding network found" in the title bar of the network. Pseudo-networks cannot be edited.
- If the sequence of the networks is incorrect, pseudo networks will be inserted at the corresponding locations. These pseudo networks are highlighted in gray and contain the text "The networks are not synchronized" in the title bar of the network. The pseudo network also features a "Go to network <No>" link, which you can use to navigate to the corresponding network.

Example

The following figure shows an example of the detailed comparison for the LAD programming language:



Reducing the number of differences displayed

For the sake of clarity, not all the differences are highlighted but rather the first difference of an operation in each case. For example, if all the inputs in a box with multiple inputs are different in the offline and online versions of the block, only the first input is highlighted as a difference. You can resolve this difference and update the comparison list. The next input will then be highlighted as a difference.

The number of differences highlighted within a network therefore depends on the number of instructions.

Changing blocks during detailed comparison (Page 1070)

Updating comparison results (Page 1071)

Navigating in the detailed comparison

Requirement

You have run a detailed comparison.

Navigate to the differences

To navigate to a difference between the two blocks, follow these steps:

1. Open the list of results for the detailed comparison under "Info > Comparison result" in the Inspector window.
2. Double-click a difference.

   The difference is selected in both editors.

Or:

1. Click one of the following navigation buttons on the toolbar:
   – Position on first difference

     Navigates to the first difference in the block, and displays the difference in both editors.

   – Position on previous difference

     Navigates to the previous difference starting from the current position, and displays the difference in both editors.

   – Position on next difference

     Navigates to the next difference starting from the current position, and displays the difference in both editors.

   – Position on last difference

     Navigates to the last difference in the block, and displays the difference in both editors.

Switching off/on the synchronization of the vertical scrolling between the editors

The scrolling for both editors is synchronized to ensure that the corresponding networks are visible parallel to each other during vertical scrolling. You can switch this mode off and on. To do this, follow these steps:

1. To switch off synchronized scrolling, click the "Synchronize scrolling between editors" button in the toolbar.
2. To switch on synchronized scrolling again, click the "Synchronize scrolling between editors" button one more time in the toolbar.

9.1.6 Compiling and downloading blocks

9.1.6.1 Compiling blocks

Basic information on compiling blocks

Introduction

A user program must first be compiled before the CPU can execute it. You need to recompile your program each time you make a change.

The following procedures take place during compilation:

- The user program is checked for syntax errors.
- All the block calls within the compiled blocks are checked. In case of changes to the interface of called blocks, errors will be shown in the "Compilation" tab of the information window. You have to correct these errors first.
- Finally, the user program is compiled into a code that can be read by the CPU.

Compilation methods

You can start compilation in the following windows or editors:

- Compiling blocks in the project tree

  Used to compile individual blocks or for the simultaneous compilation of all blocks in the "Program blocks" folder.

- Compiling blocks in the program editor

  This is intended for compilation of a single open block.

- Compiling blocks in the call or dependency structure

  Used to compile individual blocks.

  See also: Call structure (Page 1103), Dependency structure (Page 1111)

Compilation options

If you are compiling blocks in project tree, you have further options:

- Software

  Only the changed blocks are compiled.

- Software (compile all blocks)

  All blocks are compiled. This is recommended for the first compilation and after major revisions.

Consistency check

Changing the interfaces of blocks called or PLC data types used can result in inconsistencies between calling blocks and called blocks or between the PLC data types and the global data blocks which use these PLC data types.

To avoid such inconsistencies in the user program, the system performs an automatic consistency check before each compilation process. The time stamps are compared and compilation is then either carried out or cancelled depending on the results of the comparison.

- The calling block can only be compiled if the time stamps of the interfaces of the called blocks are older than those of the calling block.
- A global data block based on a PLC data type can only be compiled correctly if the time stamp of the global data block is newer than the time stamp of the PLC data type used.
- The instance data block can only be compiled correctly if the interface time stamps for the interface of the instance data block are identical to those of the assigned function block.

If the compilation process is cancelled, a message will be displayed in the inspector window. You must then update the block calls in the relevant blocks and the PLC data types in the global data blocks before re-starting the compilation process. The consistency check also finds know-how protected blocks which cannot be compiled. The corresponding messages will also be shown in the inspector window.

If you start loading immediately instead of first compiling, the blocks selected will be automatically compiled and the block call and global data blocks implicitly updated. Please note the following differences between the CPU families:

- S7-1200: All blocks affected are loaded to ensure no inconsistencies can arise.
- S7-300/400: Only the block selected is loaded.

Updating block calls in LAD (Page 918)

Updating block calls in FBD (Page 956)

Compiling blocks in the project tree

You can compile one block, multiple blocks or all of the blocks in the project tree.

Requirements

The project tree is open.

Compiling one or more blocks in the project tree

To compile multiple blocks in the project tree, follow these steps:

1. Open the "Program blocks" folder in project tree.
2. Select the blocks you want to compile.
3. Select the "Compile > Software" command in the shortcut menu.

Compiling all blocks in the project tree

To compile all blocks in the "Program blocks" folder in project tree, follow these steps:

1. Select the "Program blocks" folder in the project tree.
2. You can select one of two different options for the compilation:
   - If you want to compile only the changes since the last compilation, select the "Compile > Software" command in the shortcut menu.
   - If you want to compile all blocks completely, select the "Compile > Software (compile all blocks)" command in the shortcut menu.

Result

The code for the blocks will be generated if the consistency check has been successful. Instance data blocks generated by the system which are no longer needed will be deleted.

The message under "Info > Compilation" in the inspector window reports whether the compilation was successful.

See also

Basic information on compiling blocks (Page 1071)

Correcting compilation errors (Page 1075)

Finding syntax errors in the program (Page 1008)

Compiling blocks in the program editor

Requirements

The block to be compiled is open.

Procedure

To compile a block in the program editor, follow these steps:

1. Right-click the white area underneath a network in the instruction window of the program editor.
2. Select the "Compile" command in the shortcut menu.

Result

The code for the block is generated. Instance data blocks generated by the system which are no longer needed will be deleted.

The message under "Info > Compilation" in the inspector window reports whether the compilation was successful.

See also

Basic information on compiling blocks (Page 1071)

Compiling blocks in the project tree (Page 1073)

Correcting compilation errors (Page 1075)

Correcting compilation errors

In the Inspector window in "Info > Compile", you can see whether any compilation was successful or whether errors were detected in the program. If errors occur, you will need to correct them and then start the compilation again.

Procedure

To correct errors following compilation, follow these steps:

1. Open the error list in the Inspector window with "Info > Compile".
2. If there is one, click on the blue question mark next to the error text for information on remedying errors.
3. Double-click the error you want to correct.

   The corresponding error is highlighted.
4. Correct the error.
5. Restart compilation.

9.1.6.2 Downloading blocks

Introduction to downloading blocks

Downloading blocks to device

So that the CPU can execute the user program, the program must first be compiled and then downloaded to the device. The following options are available for downloading:

- Downloading blocks to the program editor

  You can load a single open block in the program editor.
- Downloading blocks to the project tree

  You can download several or all of the blocks in the block folder via the project tree.
- Downloading blocks to an accessible device

  You can download blocks to an accessible device by dragging them.

Note

To avoid inconsistencies between calling and called blocks, all blocks affected are compiled and loaded after each global change, such as a change in the block interface.

Note

S7-1200 Version 1.0

Please note the following:

- If you download a know-how-protected block to a device, no restore information is loaded along with it. This means that you cannot reopen a know-how-protected block if you upload it from the device.
- If you download an element of your project to the CPU, for example a program block, a data block or the hardware configuration, the CPU runs a cold restart the next time it changes to RUN mode. Apart from deleting the inputs, initializing the outputs and deleting the non-retentive memory, cold restart also deletes the retentive memory areas. All subsequent changes from STOP to RUN are warm restarts in which the retentive memory is not deleted.

Uploading blocks from device

You can upload blocks from an accessible device to your project. This is necessary, for example, if you want to edit blocks that only exist in the device. All available blocks (organization blocks, function blocks, functions and data blocks) and the global PLC tags are uploaded to the project.

Uploading blocks from or downloading blocks to a memory card

Memory cards are plug-in cards used, for example, to expand the memory of a device. Only Siemens SD cards can be used for devices of the S7-1200 series.

To use a memory card as replacement of the load memory, you must download the user program or individual blocks to a memory card. You can just as well upload blocks from a memory card back into the project.

Note

Note the following when uploading to or downloading from a memory card:

- If the CPU contains no previous program and you insert an empty memory card in the CPU the program will be loaded from the PG/PC to the memory card and not to the CPU.
- If you insert an empty memory card prior to the startup of the CPU, the program that is on the CPU will be transferred automatically to the memory card. The program on the CPU will then be deleted.
- If you insert a memory card with a program in the CPU prior to the startup of the CPU and the CPU already contains a program, the program on the memory card will be executed and not the program on the CPU. The program on the CPU will be deleted.

Downloading blocks to device

Downloading blocks from program editor to device

Requirement

The block to be downloaded is open.

Procedure

To download a block from the program editor to the device, follow these steps:

1. Right-click the white area underneath a network in the instruction window of the program editor.
2. Select the "Download to device" command in the shortcut menu.
   - If you have not already established an online connection, the "Extended download to device" dialog will open. Set all the necessary parameters for the connection and click on "Load". You can also open the "Extended download to device" dialog via the "Online" menu.

     See also: Going online and going offline
   - If you have already defined an online connection, the project data will if necessary be compiled and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for loading.

3. Check the messages and, where necessary, enable the actions in the "Action" column.

NOTICE
Performing the proposed actions during system operation can cause serious damage to property or injury to persons if there are functional faults or program errors! Make sure before starting the actions that they will not pose a hazard.

   As soon as downloading becomes possible, the "Load" button is enabled.

4. Click on "Load".

   The block is downloaded and the "Load results" dialog opens. This dialog shows you the status and the actions after downloading.

5. If you want to start the modules again directly after downloading, select the "Start all" check box.
6. To close the "Load results" dialog box, click "Finish".

Result

The code for the block will be downloaded to the device. If the changes affect additional blocks, these will be compiled and also downloaded to the device. Blocks that only exist in the device online will be deleted. Inconsistencies between the blocks in the user program are avoided by downloading all blocks affected and deleting the unnecessary blocks in the device.

The messages under "Info > General" in the Inspector window show whether the downloading process was successful.

Downloading blocks to an accessible device (Page 1081)

Downloading blocks from the project tree to the device

In the project tree you can download one block, multiple blocks or all blocks to a device.

Downloading one or more blocks from the project tree to the device

To download one block or multiple blocks to the device from the project tree, follow these steps:

1. Open the "Program blocks" folder in project tree.
2. Select the blocks you want to download.
3. Select the "Download to device > Software" command in the shortcut menu.
   – If you have not already established an online connection, the "Extended download to device" dialog will open. Set all the necessary parameters for the connection and click on "Load". You can also open the "Extended download to device" dialog via the "Online" menu.

     See also: Going online and going offline

   – If you have already defined an online connection, the project data will if necessary be compiled and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for loading.
4. Check the messages and, where necessary, enable the actions in the "Action" column.

NOTICE
Performing the proposed actions during system operation can cause serious damage to property or injury to persons if there are functional faults or program errors! Make sure before starting the actions that they will not pose a hazard.

   As soon as downloading becomes possible, the "Load" button is enabled.
5. Click on "Load".

   The blocks will be downloaded and the "Load results" dialog will open. This dialog shows you the status and the actions after downloading.
6. If you want to start the modules again directly after downloading, select the "Start all" check box.
7. To close the "Load results" dialog box, click "Finish".

Downloading all blocks from the project tree to the device

To download all blocks in the "Program blocks" folder to the device from the project tree, follow these steps:

1. Select the "Program blocks" folder in the project tree.
2. Select the "Download to device" submenu in the shortcut menu.

3. If you only want to download the changes since the last download, select the "Software" option. If you want to download all blocks in their entirety, select the "Software (all blocks)" option.

   – If you have not already established an online connection, the "Extended download to device" dialog will open. Set all the necessary parameters for the connection and click on "Load". You can also open the "Extended download to device" dialog via the "Online" menu.

     See also: Going online and going offline

   – If you have already defined an online connection, the project data will if necessary be compiled and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for loading.

4. Check the messages and, where necessary, enable the actions in the "Action" column.

NOTICE
Performing the proposed actions during system operation can cause serious damage to property or injury to persons if there are functional faults or program errors! Make sure before starting the actions that they will not pose a hazard.

   As soon as downloading becomes possible, the "Load" button is enabled.

5. Click on "Load".

   The blocks will be downloaded and the "Load results" dialog will open. This dialog shows you the status and the actions after downloading.

6. If you want to start the modules again directly after downloading, select the "Start all" check box.

7. To close the "Load results" dialog box, click "Finish".

Result

The code for the blocks is downloaded to the device. If the changes affect additional blocks, these will be compiled and also downloaded to the device. Blocks that only exist in the device online will be deleted. Inconsistencies between the blocks in the user program are avoided by downloading all blocks affected and deleting the unnecessary blocks in the device.

The messages under "Info > General" in the Inspector window show whether the downloading process was successful.

Downloading blocks from program editor to device (Page 1077)

Downloading blocks to an accessible device (Page 1081)

Downloading blocks to an accessible device

Requirement

The accessible devices are displayed.

See also: Displaying accessible devices (Page 3071)

Procedure

To download blocks to an accessible device, follow these steps:

1. Open the "Program blocks" folder of the PLC in the project tree.
2. Select the blocks you want to download to the accessible devices.
3. In the project tree, drag the blocks to the "Program blocks" folder of the accessible device.

   The "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for loading.
4. Check the messages and, where necessary, enable the actions in the "Action" column.

NOTICE
Performing the proposed actions during system operation can cause serious damage to property or injury to persons if there are functional faults or program errors! Make sure before starting the actions that they will not pose a hazard.

   As soon as downloading becomes possible, the "Load" button is enabled.
5. Click the "Load" button.

   The load is executed. The "Load results" dialog will then open. In this dialog, you can check whether or not loading was successful and take any further action that may be necessary.
6. If you want to start the modules again directly after downloading, select the "Start all" check box.
7. Click "Finish".

Result

The blocks selected will be downloaded to the accessible device. If the changes affect additional blocks, these will also be downloaded to the accessible node. Blocks that only exist in the device online will be deleted. Inconsistencies between the blocks in the user program are avoided by downloading all blocks affected and deleting the unnecessary blocks in the device.

The messages under "Info > General" in the Inspector window show whether the downloading process was successful.

Uploading blocks from device

Uploading blocks from device

Requirement

The online and offline versions of a block differ or a block only exists online.

Procedure

To upload blocks from a device, follow these steps:

1. Establish an online connection with the device from which you want to download the blocks.

   See also: Establishing and terminating an online connection
2. Select the "Program blocks" folder.
3. In the "Online" menu, select the "Upload from device" command.

   The "Upload preview" dialog box opens. This dialog displays messages and proposes actions necessary for loading.
4. Check the messages and, where necessary, enable the actions in the "Action" column.

   As soon as uploading becomes possible, the "Upload from device" button is enabled.
5. Click the "Upload from device" button.

   The load is executed.

Result

The blocks will be uploaded from the device to the project. You can edit them as normal, recompile them and download them to the device again.

See also

Uploading blocks from an accessible device (Page 1083)

Uploading blocks from an accessible device

Requirement

- The accessible devices are displayed.

  See also: Displaying accessible devices (Page 3071)
- The project includes a device.

Procedure

To upload blocks from an accessible device to your project, follow these steps:

1. In the project tree, drag the accessible device "Program blocks" folder to the "Program blocks" folder of the device in the project.

   The "Upload preview" dialog box will open. This dialog displays messages and proposes actions necessary for loading. If the device folder in the project already contains data, a message will inform you that this data will be replaced.
2. Check the messages and, where necessary, enable the actions in the "Action" column.
3. The "Upload from device" button will be enabled as soon as uploading becomes possible.
4. Click on the "Upload from device" button.

Result

The blocks will be uploaded from the accessible devices to the project. You can edit them as normal and recompile and load them.

Uploading blocks from device (Page 1082)

Uploading blocks from or downloading blocks to a memory card

Downloading blocks to a memory card

Requirement

- The memory card is not marked as program card.
- The "Program blocks" folder of the memory card is open.

Procedure

To download blocks to a memory card, follow these steps:

1. Open the device "Program blocks" folder in the project tree.
2. Select the blocks you want to download to the memory card.
3. Drag the blocks in project tree to the "Program blocks" folder of the memory card.

   The "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for loading.
4. Check the messages and, where necessary, enable the actions in the "Action" column.
5. As soon as downloading becomes possible, the "Load" button is enabled.
6. Click the "Load" button.

   The load is executed. The "Load results" dialog will then open. In this dialog, you can check whether or not loading was successful and take any further action that may be necessary.
7. Click "Finish".

Result

The block is downloaded to the memory card If the changes affect additional blocks, these will also be downloaded to the memory card. Blocks that exist only on the memory card are deleted. Inconsistencies between the blocks in the user program are avoided by downloading all affected blocks and the deleting of the non-required blocks on the memory card.

The messages under "Info > General" in the Inspector window show whether the downloading process was successful.

Downloading blocks to a memory card (Page 1083)

9.1.7 Protecting blocks

9.1.7.1 Protecting blocks

Introduction

You can use a password to protect one or more blocks of the OB, FB, FC type and global data blocks from unauthorized access.

You can not manually protect instance data blocks; they depend on the know-how protection of the assigned FB. This means that when you create an instance data block for a know-how protected FB, the instance data block also receives this know-how protection. This is independent of whether you explicitly create the instance data block or if it is created by a block call.

If a block is know-how protected, only the following data is readable without the correct password:

- Interface parameters Input, Output, InOut, Return, Static, Temp
- Block title
- Block comment

- Block properties
- Global tags without information on the point of use

The following actions can be performed with a know-how protected block:

- Copying and deleting
- Calling in a program
- Online/offline comparison
- Compiling and loading
- Printing

The code of the block, on the other hand, is protected from unauthorized reading and modification. For S7-1200 CPUs, you can also set up copy protection which binds execution of the block to the CPU or SD card with the defined serial number.

Note

Please note the following:

- S7-1200 Version 1.0: If you download a know-how-protected block to a device, no restore information is loaded along with it. This means that you cannot open a know-how-protected block again even with the correct password if you upload it from the device.
- Only the non-protected data is compared in offline-online comparison of know-how protected blocks.
- You will no longer be able to access the block if you do not have the password.
- If you add a know-how-protected block to a library, the master copy created will also be know-how protected. You therefore require the correct password for the know-how protected block when using copies.

Removing block know-how protection (Page 1092)

Changing a password (Page 1091)

9.1.7.2 Setting up and removing block copy protection

For S7-1200 CPUs, you can set up copy protection which binds execution of the block to a specific CPU or specific SD card. The block can then only be executed if it is in the device with the set serial number.

It is important that you also know-how-protect any block for which you have set up copy protection. If you do not, anyone can reset the copy protection. You must, however, set up copy protection first as the copy protection settings are read-only if the block is already know-how-protected.

Note

You can only remove the copy protection of a block if the block is not know-how protected. This means that you cannot remove the copy protection of a block with know-how protection that you load from a device, because you cannot undo the know-how protection.

Requirement

The block is not know-how protected.

Setting up copy protection

To set up copy protection for a block, follow these steps:

1. Open the block you wish to copy-protect.
2. Open the "Properties" tab in the inspector window.
3. Select "Protection" in the area navigation in the inspector window.
4. Select either "Bind to serial number of the CPU" or "Bind to serial number of the memory card" from the drop-down list in the "Copy protection" area.
5. Enter either the serial number of the CPU or memory card or enable the option "Serial number inserted when downloading to a device or memory card" if the serial number is to be inserted automatically when you load.
6. You can now set up the know-how protection for the block in the "Know-how protection" area.

Removing copy protection

To remove copy protection, follow these steps:

1. Remove the know-how protection for the block whose copy protection you wish to remove.
2. Open the block.
3. Open the "Properties" tab in the inspector window.
4. Select "Protection" in the area navigation in the inspector window.
5. Select "No binding" in the drop-down list in the "Copy protection" area.

Changing a password (Page 1091)

9.1.7.3 Setting up block know-how protection

You can set up know-how protection for blocks in the devices in your project.

Procedure

To set up block know-how protection, follow these steps:

1. Select the blocks with no know-how protection which you want to protect.
2. Select the command "Know-how protection" in the "Edit" menu.

   The "Know-how protection" dialog will open.
3. Click "Define".

   The "Define password" dialog box opens.
4. Enter a password in the "New" field.
5. Enter the same password in the "Confirm" field.
6. Confirm your entries with "OK".
7. Close the "Know-how protection" dialog by clicking on "OK".

Result

The blocks selected will be know-how-protected. Know-how protected blocks are marked with a lock in the project tree. The password entered is valid for all blocks selected.

Opening know-how protected blocks (Page 1089)

Printing know-how protected blocks (Page 1090)

Removing block know-how protection (Page 1092)

Changing a password (Page 1091)

9.1.7.4 Opening know-how protected blocks

You can only open multiple know-how protected blocks at once if they are protected with the same password.

Procedure

To open a know-how protected block, follow these steps:

1. Double-click on the block you wish to open.

   The "Access protection" dialog will open.
2. Enter the password for the know-how protected block.
3. Confirm your entry with "OK".

Result

The know-how protected block will open provided you have entered the correct password. However, the block will remain know-how protected. If you copy the block or add it to a library, for example, the copies will also be know-how protected.

Once you have opened the block, you can edit the program code and the block interface of the block for as long as the block or TIA portal is open. The password must be entered again the next time the block is opened. If you close the "Access protection" dialog with "Cancel", the block will open but the block code will not be displayed and you will not be able to edit the block.

Changing a password (Page 1091)

9.1.7.5 Printing know-how protected blocks

You can only print complete know-how protected blocks if they have been opened with the correct password. If you print a closed block or if the block was not opened with the correct password, only the non-protected block data will be printed.

Procedure

To print a know-how protected block in full, follow these steps:

1. Open the know-how protected block you wish to print.

   See also: Opening know-how protected blocks (Page 1089)
2. Select the "Print" command in the "Project" menu.

   The "Print" dialog will open.
3. Select the printer in the "Name" field.
4. Click "Advanced" to modify the Windows printer settings.
5. Select the documentation information set in the "Document information" drop-down list that you want to use for the frame layout.
6. Under "Print objects/area" select whether you want to print all objects or the complete area, or only a selection.
7. Under "Properties" select the print scope.
   - Select "All" to print the complete block.
   - Choose "Visible" to print all the information within the block that is visible on the screen.
   - Select "Compact" to print a shortened form of the block.
8. Click "Preview" to generate a print preview in advance.

   A print preview is created in the work area.
9. Click "Print" to start the printout.

Changing a password (Page 1091)

9.1.7.6 Changing a password

Procedure

To change the password, follow these steps:

1. Select the know-how protected blocks for which you want to change the password.

   Note

   You can only change the password for several blocks at once if all blocks selected have the same password.

2. Select the command "Know-how protection" in the "Edit" menu.

   The "Know-how protection" dialog will open.

3. Click the "Change" button.
4. Enter the old password in the "Old" field.
5. Enter the new password in the "New" field.
6. Enter the new password again in the "Confirm" field.
7. Confirm your entries with "OK".
8. Close the "Know-how protection" dialog by clicking on "OK".

Removing block know-how protection (Page 1092)

9.1.7.7 Removing block know-how protection

Procedure

To remove block know-how protection, follow these steps:

1. Select the blocks for which you want to remove know-how protection.

   Note

   You can only remove know-how protection for several blocks at once if all blocks selected have the same password.

2. Select the command "Know-how protection" in the "Edit" menu.

   The "Know-how protection" dialog will open.
3. Deactivate the check box "Hide code (know-how protection)".
4. Enter the password.
5. Confirm your entries with "OK".

Result

Know-how protection will be disabled for the blocks selected.

9.2 Displaying program information

9.2.1 Overview of available program information

Program information

The program information of a user program contains the view specified in the following table.

View	Application
Assignment list (Page 1094)	Provides an overview of the address bits for the I, Q, and M memory areas already allocated within the user program. Also indicates if an address has been allocated by access from an S7 program or if the address has been assigned to a SIMATIC S7 module.
Call structure (Page 1103)	Shows the call structure of the blocks within the user program and provides an overview of the blocks used and their relationships.
Dependency structure (Page 1111)	Shows the list of blocks used in the user program. A block is shown at the first level and blocks that call or use this block are indented below it. In contrast to the call structure, instance blocks are listed separately.
Resources (Page 1117)	Shows the hardware resources of the CPU for objects (OB, FC, FB, DB, PLC tags and user-defined data types), for CPU memory areas and for the existing I/O modules.

Displaying several views simultaneously

You can generate and display several views for one or more user programs to facilitate testing and changing your user program.

Displaying multiple views, for example, enables you to:

- Display all program information for a user program next to one another
- Compare different user programs

9.2.2 Displaying an assignment list

9.2.2.1 Introduction to the assignment list

Program information in the assignment list

The assignment list shows if an address has been allocated by access from an S7 program or if the address has been assigned to a SIMATIC S7 module. It is therefore an important basis for locating errors or changes in the user program.

In the assignment list, you have a CPU-specific overview of which bit is used in which byte of the memory areas listed below:

- Input (I)
- Output (O)
- Bit memory (M)
- Timer (T)
- Counter (C)
- I/O (P)

Display of the assignment list

The assignment list of inputs, outputs, and bit memory is displayed in several separate work windows.

Filters

You can filter the display within the assignment list. You can use predefined filters or create your own.

Displaying cross-reference information

You have the option of displaying cross-reference information for selected addresses in the assignment list.

You can display the cross-references for a selected address in the Inspector window using the "Cross-reference information" shortcut menu command. The command "Tools > Cross-references" allows you to also open the cross-reference list for the selected object.

Displaying the PLC tag table

You can open the PLC tag table from the assignment list and edit the properties of the tags used.

To do this select an address of the assignment list and select the "Open editor" command in the shortcut menu.

Enabling the display of retentivity

You can enable and disable the display of the retentive state of bit memory by selecting the "Hide/show retain area" toolbar button.

See also

Symbols in the assignment list (Page 1096)

Layout of the assignment list (Page 1095)

9.2.2.2 Layout of the assignment list

Layout of the assignment list

Depending on the CPU, the assignment list is displayed in several work windows with the following operands.

For S7-300/400 CPUs:

- Inputs
- Outputs
- Bit memory
- Timers
- Counters

For S7-1200 CPUs:

- Inputs
- Outputs
- Bit memory

Displaying inputs, outputs, bit memory, timers and counters

It shows all operands used and their assignment in the S7 program.

For all displayed operands, each line in the assignment list is dedicated to a byte of the memory area, in which the corresponding eight bits from 7 to 0 are labeled according to their access. In conclusion, a "bar" indicates if access is made by a byte (B), word (W) or double word (D).

You can find an explanation of the symbols in the assignment list here. (Page 1096)

See also

Introduction to the assignment list (Page 1094)

9.2.2.3 Symbols in the assignment list

Meaning of the symbols in the assignment list

The following table shows the meaning of the symbols in the assignment list:

Symbol	Meaning
◆	Indicates the address assignment in the selected state.
◆	Indicates the address assignment in the non-selected state.
◇	Indicates that a pointer start address and a tag address access the same address range and that they are selected.
◇	Indicates that a pointer start address and a tag address access the same address range and that they are not selected.
•	Indicates the pointer assignment in the selected state.
•	Indicates the pointer assignment in the non-selected state.
▮	Indicates that the byte is in use with byte access and the corresponding tag is selected. The shortcut menu allows you to display cross-reference information for the selected variables as well as the PLC tag table.
▮	Indicates that the byte is in use with byte access and the corresponding tag is not selected.
▮ ▮	Indicates that the byte is in use with word access and the corresponding tag is selected. The shortcut menu allows you to display cross-reference information for the selected variables as well as the PLC tag table.
▮ ▮	Indicates that the byte is in use with word access and the corresponding tag is not selected.
▮ ▮ ▮ ▮	Indicates that the byte is in use with double word access and the corresponding tag is selected. The shortcut menu allows you to display cross-reference information for the selected variables as well as the PLC tag table.
▮ ▮ ▮ ▮	Indicates that the byte is in use with double word access and the corresponding tag is not selected.
Background color: gray	Indicates that a byte is in use with byte, word or double word access and that the address is also in use by the hardware. The gray background color indicates overlapping memory access.
Background color: yellow	Indicates that the address is not in use by the hardware.
▦	Indicates that the memory area has been defined as system memory.
⏲	Indicates that the memory area has been defined as clock memory.

Layout of the assignment list (Page 1095)

Introduction to the assignment list (Page 1094)

9.2.2.4 Displaying an assignment list

Requirement

A project has been created with programmed blocks.

Procedure

Proceed as follows to display the assignment list:

1. Select the "Program blocks" folder or one or more of the blocks it contains.
2. Select the "Assignment list" command in the "Tools" menu.

Result

The assignment list for the selected program is displayed.

View options in the assignment list

Refer to view respective view options that are set to display the desired information in the assignment list.

See also

Setting the view options for the assignment list (Page 1098)

Layout of the assignment list (Page 1095)

9.2.2.5 Setting the view options for the assignment list

Introduction

The following view options are available for the assignment list:

- Used addresses:

  When this check box is activated, the addresses, I/Os and pointers used in the program are displayed.

- Free hardware addresses:

  When this check box is activated, only the free hardware addresses are displayed.

Requirement

- A project has been created with programmed blocks.
- The assignment list is open.

Procedure

Proceed as follows to set the view options for the assignment list:

1. Click on the arrow of the symbol ("View options") in the task bar.

   The view options for the assignment list are opened. Check marks are set in front of the activated view options.

2. If you want to activate or deactivate a view option, click on the respective check box and set or remove the check mark.

Result

The view options are set and the desired information is displayed in the assignment list.

9.2.2.6 Filter options in the assignment list

Filter settings

You can define your own filter settings for the assignment list. The following options are available for defining filters:

- Display all addresses of the address areas specified.
- Display of single, defined addresses from the selected address area, for example, "0" and "200".
- Display of complete areas from the selected address area, for example, "0 - 256".

The following table provides an overview of all available options:

Selection in the	Selection	Symbol	Meaning
Address area	All CPU-dependent displayed addresses (I, O, M, T, C) can be activated as they are by default, or individual address areas can be activated.	Check box is activated	Only the activated address areas (I, O, M, T, C) are shown in the assignment list.
Filter area	Show assignment for all addresses	*	Displays the assignment of all addresses of the enabled address areas (I, Q, M).
	Show assignment for selected addresses, for example, for the inputs "IB 0" and "IB 256"	0;256 Separate individual addresses and areas by a semicolon.	Assignments of selected addresses for the activated address areas (I) are shown.
	Show assignment for selected areas, for example, for the inputs "IB 0 to IB 100" and "IB 200 to IB 256".	0-100;200-256 Contiguous areas should be connected by a hyphen.	Assignments of selected areas for the activated address areas (I) are shown.

9.2.2.7 Defining filters for assignment list

Requirement

- A project has been created with programmed blocks.
- The assignment list is open.

Defining filter

Proceed as follows to define a filter for the assignment list:

1. Click on the symbol ("Filter") in the task bar.

   The "Assignment List Filter" dialog opens.
2. Click on the symbol ("Create new filter") in the task bar.

   A new filter is created with the name "Filter_1". The check boxes for all addresses (inputs, outputs, memory bits, timers and counters) are activated by default for the filter.
3. If you want to change the name of the filter, click on the drop-down list in the task bar and enter a new filter name.
4. Deactivate the check boxes of addresses that are not to be affected by the filter.
5. Enter one of the following options in the filter area of the activated address:
   - Show all addresses used = "*"
   - Show single, defined addresses, for example, IB 0" and IB 25 = "0.25". Individual addresses and address areas are separated by commas or semicolons.
   - Show complete address areas, for example, IB 0 to IB 256 = "0-256". Complete address areas should be connected by a hyphen.
6. Confirm your entries with "OK".

   The newly defined filter is shown in the task bar of the assignment list under the specified name.

Delete filter

Proceed as follows to delete a filter:

1. Click on the symbol ("Filter") in the task bar.

   The filter dialog for the assignment list opens.
2. In the drop-down list of the task bar, select the filter you want to delete.
3. Click on the symbol ("Delete selected filter") in the task bar.

   The selected filter is deleted.

See also

Filter options in the assignment list (Page 1099)

Displaying an assignment list (Page 1097)

Introduction to the assignment list (Page 1094)

9.2.2.8 Filtering an assignment list

Requirement

- A project has been created with programmed blocks.
- The assignment list is open.

Procedure

1. Click on the arrow on the drop-down list.

   The available filter are displayed.
2. Select the desired filter.

Result

The assignment list is filtered according to the settings of the selected filter.

Note

The filter settings are saved when the project is closed.

9.2.2.9 Defining retentive memory areas for bit memories

Introduction

In the assignment list you can define the width of the retentive memory area for bit memories. The content of tags which are addressed in retentive memory is retained after power off and at the STOP to RUN transition after power on.

The display of retentive bit memories can be enabled and disabled in the assignment list. If their display is enabled, retentive bit memories are identified by an icon in the "Address" column.

Requirement

The assignment list is open.

Procedure

Proceed as follows to define the width of the retentive memory area for bit memories:

1. Click "Retain" in the toolbar.

   The "Retain memory" dialog will open.
2. Starting at the count of 0, define the width of the retentive memory area by entering the last byte of this area in the input field. Watch out for any addresses of tags already assigned to the retentive area.
3. Load the block to the target system. Select the "Program blocks" folder in the Project tree and select the "Download to device" submenu in the shortcut menu.

Result

The width of the retentive memory area is defined. If enabled in the assignment list, an icon will indicate the retentive state of all tags in the "Address" column.

9.2.2.10 Enabling the display of retentive bit memories

Introduction

In the assignment list you can enable and disable the display of retentive bit memories. The retentive bit memories are identified by means of an icon in the "Address" column if the display of retentivity is enabled.

Requirement

The assignment list is open.

Procedure

Proceed as follows to enable and disable the display of retentive bit memories:

1. Click "Display/hide retentivity" in the toolbar.

Result

The retentive tags are identified by means of an icon in the "Address" column of the bit memory area if the display of retentivity is enabled. The icons in the "Address" column are hidden if the display of retentivity is disabled.

9.2.3 Displaying the call structure

9.2.3.1 Introduction to the call structure

Call structure

The call structure describes the call hierarchy of the block within an S7 program.

It provides an overview of:

- The blocks used
- Jumps to the places of use of the blocks
- Relationships between blocks
- Local data requirements of the blocks
- Status of the blocks

Information in the call structure

Displaying the call stucture provides you with a list of the blocks used in the user program. The first level of the call structure is highlighted in color and shows the blocks that are not called by any other block in the program. Organization blocks are always shown on the first level of the call structure. Functions, function blocks and data blocks are only shown on the first level if they are not called by an organization block. When a block calls other blocks or functions, they are listed indented under the calling block. Instructions and blocks are shown in the call structure only if they are called by a block.

View options

The following view options are available for the call structure:

- Show conflicts only:

  When this check box is activated, only the conflicts within the call structure are displayed.
- Group multiple calls together:

  When this check box is activated, several block calls are grouped together. The number of block calls is displayed in the "Call frequency" column. The links to the various call locations are offered in a drop-down list in the "Details" column.

Displaying the block calls

You can display the block calls in a block by clicking on the arrow in front of the block title. To display the call information of all blocks, click on the "Expand list" icon in the toolbar.

You can hide the total overview by clicking the "Collapse list" icon.

Displaying cross-reference information

You can display the cross-reference information for a block in the Inspector window by right-clicking on the relevant block and selecting the "Cross-reference information" command from the shortcut menu.

To open the "Cross-references" view, click the "Cross-references" command in the shortcut menu.

Displaying blocks in the program editor

You can open the program editor and edit blocks there from the call structure.

To do this select the required block in the call structure and select the "Open editor" command in the shortcut menu.

Displaying deleted blocks

The rows belonging to deleted blocks are identified by an icon.

Note

Please note that any existing local data can only be displayed or updated after compiling a block.

See also

Symbols in the call structure (Page 1105)

9.2.3.2 Symbols in the call structure

Meaning of the symbols in the call structure

The following table shows the meaning of the symbols in the call structure:

Symbol	Meaning
🟪	Indicates an organization block (OB).
🟦	Indicates a function block (FB).
🟩	Indicates a function (FC).
⛁	Indicates a data block (DB).
⛁	Indicates that the block is declared as a multiinstance.
⊡	The object has an interface dependency to an object connected to the left.
□	Indicates that the block needs to be compiled again.
▯	Indicates that the data block needs to be compiled again.
╲	Indicates that the object is not available.
⊐	Indicates that the interface causes a time stamp conflict.
🕓	Indicates that the variable causes a time stamp conflict.
▪	Indicates that the block is not called directly or indirectly from an OB.
🔒	Indicates that an object has know-how protection.
▶	Indicates that the block is normally called recursively.
⊡	Indicates that a tag declaration in the interface has a recursive dependency: • Scenario 1: FB1 calls FB2 and this then calls FB1. The instance data blocks of these FBs have a recursion in the interface. • Scenario 2: A multiple instance FB uses the instance DB of its parent FB as a global DB.

9.2.3.3 Layout of the call structure

Layout of the call structure

The view of the call structure consists of the following columns:

Column	Content/meaning
Call structure	Shows an overview of the blocks called If the viewing option "Group multiple calls together" is enabled, several block calls are grouped together and the "Number of calls" column is displayed.
Call type (!)	Shows the type of call, for example recursive block call.
Address	Shows the absolute address of the block. With a function block, the absolute address of the corresponding instance data block is also shown.
Details	Shows the network or interface of the calling block. All information are offered as a link in this column. With this link, you can jump to the location of the block call in the program editor. If the viewing option "Group multiple calls together" option is enabled, the calls are grouped together and are available as links in a drop-down list.
Local data (in path)	Indicates the local data requirement of the full path. Blocks with optimized access have higher local data requirements because the information for the symbolic addressing is stored with them. Please note that any existing local data can only be displayed or updated after compiling a block.
Local data (for blocks)	Show the local data requirements of the block. Blocks with optimized access have higher local data requirements because the information for the symbolic addressing is stored with them. Please note that any existing local data can only be displayed or updated after compiling a block.

See also

Symbols in the call structure (Page 1105)

Introducing the consistency check in the call structure (Page 1109)

9.2.3.4 Displaying the call structure

Requirement

A project has been created with blocks.

Procedure

Proceed as follows to display the call structure:

1. Select the "Program blocks" folder or one or more of the blocks it contains.
2. Select the "Call structure" command in the "Tools" menu.

Result

The call structure for the selected program is displayed.

Note

Please note that any existing local data can only be displayed or updated after compiling a block.

See also

Setting the view options for the call structure (Page 1108)

9.2.3.5 Setting the view options for the call structure

Introduction

The following view options are available for the call structure:

- Show conflicts only:

  Only the blocks causing conflicts within the call structure are displayed if this check box is activated.

  The following blocks cause conflicts:

  – Blocks executing any calls with older or newer code time stamps.

  – Blocks calling a block with modified interface.

  – Blocks using a tag with modified address and/or data type.

  – Block called neither directly, nor indirectly by an OB.

  – Blocks calling a block which no longer exists.

- Group multiple calls together:

  When this viewing option is enabled, several block calls and data block accesses are grouped together. The number of block calls is displayed in the "Call frequency" column. The links to the various call locations are offered in a drop-down list in the "Details" column.

Requirement

- A project has been created with programmed blocks.
- The call structure is open.

Procedure

Proceed as follows to set the view options for the call structure:

1. Click on the arrow of the symbol ("View options") in the task bar.

   The view options for the call structure opens. Check marks are set in front of the activated view options.

2. If you want to activate or deactivate a view option, click on the respective check box and set or remove the check mark.

Result

The view options are set and the required information is displayed in the call structure.

9.2.3.6 Introducing the consistency check in the call structure

Consistency check

Changing the time stamp of a block during or after the program is generated can lead to time stamp conflicts, which in turn cause inconsistencies among the blocks that are calling and being called.

Using the consistency check

The "Consistency check" function is used to visualize inconsistencies when time stamp conflicts occur. Whe the consistency check is performed, the inconsistent blocks are shown in the call structure and marked with the correspoinding symbols.

- Most time stamp and interface conflicts can be rectified by recompiling the blocks.
- If compilation fails to clear up inconsistencies you can use the link in the "Details" column to go to the source of the problem in the program editor and manually eliminate any inconsistencies.
- The blocks marked in red must be recompiled.

See also

Symbols in the call structure (Page 1105)

9.2.3.7 Checking block consistency in the call structure

Requirement

- A project has been created with programmed blocks.
- The call structure is open.

Procedure

Proceed as follows to check the block consistency:

1. Click on the symbol ("Consistency check") in the task bar.

   The block consistency is checked. Blocks found to be inconsistent are marked accordingly by a symbol.
2. If a block is inconsistent, click on the arrow in front of the block title in the call structure.

   The inconsistent blocks are displayed. The exact problem locations are listed as links in the "Details" column.
3. Click on the respective link in the "Details" column to jump to the location in the block requiring correction.
4. Check and correct the inconsistencies in the blocks.
5. Recompile the blocks by selecting the required blocks and clicking on the command "Compile" in the shortcut menu.
6. Download the corrected blocks to the target system by clicking the command "Download to device" in the shortcut menu.

Result

The block consistency is checked. The inconsistencies in the blocks are corrected. The corrected blocks are loaded to the target system.

See also

Symbols in the call structure (Page 1105)

9.2.4 Displaying the dependency structure

9.2.4.1 Introduction to the dependency structure

Introduction

The dependency structure shows the dependencies each block has to other blocks in the program.

Information in the dependency structure

Displaying the dependency structure provides you with a list of the blocks used in the user program. A block is shown at the far left and blocks that call or use this block are indented below it.

The dependency structure also shows the status of the individual blocks using symbols.

Objects causing a time stamp conflict and perhaps leading to an inconsistency in the program are marked with various symbols.

The dependency structure is an extension of the cross-reference list for objects.

View options

The following view options are available for the dependency structure:

- Show conflicts only:

  When this check box is activated, only the conflicts within the dependency structure are displayed.

- Group multiple calls together:

  When this check box is activated, several block calls are grouped together. The number of block calls is shown numerically in the "Dependency structure" column. The links to the various call locations are offered in a drop-down list in the "Details" column.

Displaying the dependency structure

Clicking on the arrow in front of the block title displays the blocks that call or use this block. To display the dependencies of all blocks,

click the "Expand list" icon in the toolbar.

You can hide the total overview by clicking the "Collapse list" icon.

Displaying cross-reference information

You can display the cross-reference information for a block in the Inspector window by right-clicking on the respective block and selecting the "Display Usage" command from the shortcut menu.

Displaying blocks in the program editor

You can open the program editor and edit blocks there from the dependency structure. To do this select the required block in the dependency structure and select the "Open editor" command in the shortcut menu.

9.2.4.2 Layout of the dependency structure

Layout of the dependency structure

The view of the dependency structure consists of the following columns:

Column	Content/meaning
Dependency	It indicates the dependencies between each block and the other blocks in the program.
Call type (!)	Shows the type of call, for example recursive block call.
Address	Shows the absolute address of the block.
Call frequency	Indicates the number of multiple calls of blocks.
Details	Shows the network or interface of the called block. All information are offered as a link in this column. With this link, you can jump to the location of the block call in the program editor. If the viewing option "Group multiple calls together" option is enabled, the calls are grouped together and are available as links in a drop-down list.

See also

Symbols in the dependency structure (Page 1113)

9.2.4.3 Symbols in the dependency structure

Meaning of the symbols in the dependency structure

The following table shows the meaning of the symbols in the dependency structure:

Symbol	Meaning
🟪	Indicates an organization block (OB).
🟦	Indicates a function block (FB).
🟩	Indicates a function (FC).
⛁	Indicates a data block (DB).
⊡	The object has an interface dependency to an object connected to the left.
□	Indicates that the block needs to be compiled again.
⬯	Indicates that the data block needs to be compiled again.
🕒	Indicates that there is an inconsistency with this object.
🔒	Indicates that an object has know-how protection.
⊡	Indicates that a tag declaration in the interface has a recursive dependency: • Scenario 1: FB1 calls FB2 and this then calls FB1. The instance data blocks of these FBs have a recursion in the interface. • Scenario 2: A multiple instance FB uses the instance DB of its parent FB as a global DB.

9.2.4.4 Displaying the dependency structure

Requirement

A project has been created with programmed blocks.

Procedure

Proceed as follows to display the dependency structure:

1. Select the block folder or one or more of the blocks contained therein.
2. Select the "Dependency structure" command in the "Tools" menu.

Result

The dependency structure for the selected program is displayed.

See also

Setting the view options for the dependency structure (Page 1114)

9.2.4.5 Setting the view options for the dependency structure

Introduction

The following view options are available for the dependency structure:

- Show conflicts only:

  When this check box is activated, only the conflicts within the dependency structure are displayed.

  The following blocks cause conflicts:

  – Blocks executing any calls with older or newer code time stamps.

  – Blocks called by a block with modified interface.

  – Blocks using a tag with modified address and/or data type.

  – Block called neither directly, nor indirectly by an OB.

- Group multiple calls together:

  When this check box is activated, several block calls are grouped together. The number of block calls is shown in the relevant column. The links to the various call locations are offered in a drop-down list in the "Details" column.

Requirement

- A project has been created with programmed blocks.
- The dependency structure is open.

Procedure

Proceed as follows to set the view options for the dependency structure:

1. Click on the arrow of the symbol ("View options") in the task bar.

   The view options for the dependency structure are opened. Check marks are set in front of the activated view options.

2. If you want to activate or deactivate a view option, click on the respective check box and set or remove the check mark.

Result

The view options are set and the required information is displayed in the dependency structure.

9.2.4.6 Introducing the consistency check in the dependency structure

Consistency check

Changing the time stamp of a block during or after the program is generated can lead to time stamp conflicts, which in turn cause inconsistencies among the blocks that are calling and being called.

Using the consistency check

The "Consistency check" function is used to visualize inconsistencies. Whe the consistency check is performed, the inconsistent blocks are shown in the dependency structure and marked with the correspoinding symbols.

- Most time stamp and interface conflicts can be rectified by recompiling the blocks.
- If compilation fails to clear up inconsistencies you can use the link in the "Details" column to go to the source of the problem in the program editor and manually eliminate any inconsistencies.
- The blocks marked in red must be recompiled.

9.2.4.7 Checking block consistency in the dependency structure

Requirement

- A project has been created with programmed blocks.
- The dependency structure is open.

Procedure

Proceed as follows to check the block consistency:

1. Click on the symbol ("Consistency check") in the task bar.

   The block consistency is checked. Blocks found to be inconsistent are marked accordingly by a symbol.
2. If a block is inconsistent, click on the arrow in front of the block title in the dependency structure.

   The inconsistent blocks are displayed. The exact problem locations are listed as links in the "Details" column.
3. Check and correct the inconsistencies in the blocks.
4. Recompile the blocks by selecting the required blocks and clicking on the command "Compile" in the shortcut menu.
5. Download the corrected blocks to the target system by clicking the command "Download to device" in the shortcut menu.

Result

The block consistency is checked. The inconsistencies in the blocks are corrected. The corrected blocks are loaded to the target system.

Symbols in the dependency structure (Page 1113)

9.2.5 Displaying CPU resources

9.2.5.1 Introducing resources

Introduction

The "Resources" tab indicates the hardware resources of the configured CPU for:

- the used programming objects,
- the assignment of memory areas within the CPU and
- the assigned inputs and outputs of the existing input and output modules.

Information provided in the "Resources" tab

The resources tab provides an overview of the hardware resources used on your CPU for:

- the programming objects used in the CPU (e.g. OB, FC, FB, DB, PLC tags, and user-defined data types),
- the memory areas available on the CPU (work memory, load memory, retentive memory), their maximum size and utilization by the programming objects stated above,
- the I/O of modules which can be configured for the CPU (I/O modules, digital input modules, digital output modules, analog input modules, and analog output modules), including the I/O already in use.

Display of the maximum available load memory

The maximum size of available load memory can be selected from a drop-down list box in the "Total" row of the "Load memory" column.

Display of the maximum available work memory

The maximum size of available work memory can be selected from a drop-down list box in the "Total" row of the "Work memory" column.

Display of the maximum available retentive memory

The maximum size of available retentive memory can be selected from a drop-down list box in the "Total" row of the "Retentive memory" column.

Note

Retentive memory data

All bit memories and data blocks specified as retentive will be integrated in the calculation of the retentive data.

Updating the display in the "Resources" tab

Click the "Update view" toolbar button to update the display of objects.

Benefits of the display in the "Resources" tab

The "Resources" tab of the program information dialog provides a detailed list of all objects and of the corresponding memory area used.

The tab also indicates shortage of resources and helps to avoid such states.

Blocks which are not compiled can be identified as their size is indicated by a question mark.

See also

Layout of the "Resources" tab (Page 1119)

Displaying resources (Page 1120)

Selecting the maximum load memory available (Page 1120)

9.2.5.2 Layout of the "Resources" tab

Layout of the "Resources" tab in the program information

The view of the "Resources" tab consists of the following columns:

Column	Content/meaning
Objects	The "Details" area provides an overview of the programming objects available in the CPU, including their memory assignments.
Load memory	Displays the maximum load memory resources of the CPU as a percentage and as absolute value. The values displayed under "Total" provide information on the maximum memory available in the load memory. The values displayed under "Used" provide information on the memory actually used in the load memory.
Work memory	Displays the maximum work memory resources of the CPU as a percentage and as absolute value. The values displayed under "Total" provide information on the maximum memory available in the work memory. The values displayed under "Used" provide information on the memory actually used in the load memory.
Retentive memory	Displays the maximum resources for retentive memory in the CPU as a percentage and as absolute value. The values displayed under "Total" provide information on the maximum memory available in the retentive memory. The values displayed under "Used" provide information on the memory actually used in the load memory.
I/O	Displays the I/Os which are available on the CPU, including their module-specific availability in the next columns. The values displayed at "Configured" provide information about the maximum number of I/O available. The values displayed under "Used" provide information on the memory actually used in the load memory.

DI / DQ / AI / AQ	Displays the number of configured and used inputs/outputs:
	DI = Digital inputs
	DQ = Digital outputs
	AI = Analog inputs
	AQ = Analog outputs
	The values displayed at "Configured" provide information about the maximum number of I/O available.
	The values displayed under "Used" provide information on the actually used inputs and outputs.

See also

Displaying resources (Page 1120)

Selecting the maximum load memory available (Page 1120)

Introducing resources (Page 1117)

9.2.5.3 Displaying resources

Requirement

A project with programmed blocks has been created.

Procedure

Proceed as follows to display the resources of the respective CPU memory areas:

1. Select the block folder or one or several of the blocks contained therein.
2. Select the "Resources" command in the "Tools" menu.

Result

The memory resources of the CPU are displayed.

9.2.5.4 Selecting the maximum load memory available

Requirement

A project with programmed blocks has been created.

Procedure

Proceed as follows to display the available maximum of load memory resources:

1. Open the drop-down list in the "Total" field of the "Load memory" column by clicking the icon.
2. Select a corresponding value for the CPU used by clicking it in the drop-down list box.

Result

The "Total" field displays the selected maximum memory resources.

9.3 Displaying cross-references

9.3.1 General information about cross references

Introduction

The cross-reference list provides an overview of the use of operands and tags within the user program.

Uses of cross-references

The cross-reference list offers you the following advantages:

- When creating and changing a program, you retain an overview of the operands, tags and block calls you have used.
- From the cross-references, you can jump directly to the point of use of operands and tags.
- During a program test or when troubleshooting, you are informed of the following:
  - which operand is processed by which command in which block,
  - which tag is used in which picture,
  - which block is called by which other block.
- As part of the project documentation, the cross-references provide a comprehensive overview of all operands, memory areas, blocks, tags and pictures used.

See also

Structure of the cross-reference list (Page 1122)

Displaying the cross-reference list (Page 1124)

Displaying cross-references in the Inspector window (Page 1125)

9.3.2 Structure of the cross-reference list

Views of the cross-reference list

There are two views of the cross-reference list. The difference between the two views is in the objects displayed in the first column:

- Used by:

  Display of the referenced objects. Here, you can see where the object is used.
- Used:

  Display of the referencing objects. Here, you can see the users of the object.

The assigned tool tips provide additional information about each object.

Structure of the cross-reference list

The cross-reference list has the following structure:

Column	Content/meaning
Object	Name of the object that uses the lower-level objects or that is being used by the lower-level objects.
Number	Number of uses
Point of use	Each point of use, for example, network
Property	Special properties of referenced objects, for example, the tag names in multi-instance declarations.
as	Shows additional information about the object, e.g., that an instance DB is used as template or as multiple instance.
Access	Type of access, whether access to the operand is read access (R) and/or write access (W).
Address	Address of the operand
Type	Information on the type and language used to create the object
Path	Path of object in project tree

Depending on the installed products, additional columns or different columns are displayed for the cross-references.

Settings in the cross-reference list

You can make the following settings using the buttons in the toolbar of the cross-reference list:

- Update cross-reference list

  Updates the current cross-reference list.

- Making settings for the cross-reference list

  Here, you select check boxes to specify whether all used, all unused, all defined or all undefined objects will be displayed. If the "Undefined objects" option is enabled, references to previously deleted objects are also displayed.

- Collapse entries

  Reduces the entries in the current cross-reference list by closing the lower-level objects.

- Expand entries

  Expands the entries in the current cross-reference list by opening the low-level objects.

Sorting in the cross-reference list

You can sort the entries in the "Object" column, including other product-specific columns, in ascending or descending order. To do this, click on the relevant column title.

See also

General information about cross references (Page 1121)

Displaying the cross-reference list (Page 1124)

9.3.3 Displaying the cross-reference list

Prerequisites

You have created a project.

Introduction

There are several ways of displaying cross-references depending on whether you are in the Portal view or in the Project view and which object you have selected in the project tree.

In the Portal view, you can only display cross-references for the entire CPU; in the Project view, you can, for example, display cross-references for the following objects:

- "PLC tags" folder
- "PLC data types" folder
- "Program blocks" folder
- "Tags and connections" folder
- Individual tags
- Individual PLC data types
- Individual blocks
- Technological objects

Displaying cross-references

Proceed as follows to display cross-references:

1. Select the required action in the Portal view, for example "PLC programming" and the "Show cross-references" command or select one of the objects listed above in the Project view and select the "Cross-references" command in the "Tools" menu.
2. Click the "Used by" button to display where the objects shown in the cross-reference list are used.
3. Click the "Uses" button to view the users of the objects displayed in the cross-reference list.
4. You can perform the following actions using the buttons in the toolbar:
   - Update cross-reference list
   - Making settings for the cross-reference list
   - Collapse entries
   - Expand entries
5. You can sort the entries in the "Object" and "Address" columns in ascending or descending order by clicking on the relevant column title.
6. To go to the point of use of the object, click on the displayed link.

See also

General information about cross references (Page 1121)

Structure of the cross-reference list (Page 1122)

9.3.4 Displaying cross-references in the Inspector window

Introduction

The Inspector window displays cross-reference information about an object you have selected in the "Info > Cross-references" tab. This tab displays the instances where a selected object is being used and the other objects using it.

The Inspector window also includes blocks which are only available online in the cross-references.

Structure

The Inspector window displays the cross-reference information in tabular format. Each column contains specific and detailed information on the selected object and its application. The table below shows the additional information listed in the "Info > Cross-reference" tab:

Column	Meaning
Object	Name of the object that uses the lower-level objects or that is being used by the lower-level objects.
Number	Number of uses
Point of use	Each location of use, for example, network
Property	Special properties of referenced objects, for example, the tag name in multi-instance declarations
as	Shows additional information about the object, e.g., that an instance DB is used as template or as multiple instance.
Access	Access mode Shows whether the operand is accessed by a read (R) and/or write (W) operation.
Address	Address of the operand
Monitor value	This column will only be displayed when the program editor is open. Here you can monitor global tabs using the shortcut menu.
Type	Information about the type and language used to create the object
Path	Path of object in project tree

Depending on the installed products, additional columns or different columns are displayed for the cross-references.

9.4 Testing the user program

9.4.1 Basics of testing the user program

Functions

You have the option of testing the running of your user program on the device. You can then monitor signal states and values of tags and can assign values to tags to simulate certain situations in the running of the program.

Requirement

There must be an executable program loaded on the device.

Test options

The following test options are available:

- Testing with program status

  The program status allows you to monitor the running of the program. You can display the values of operands and the results of logic operations (RLO) allowing you to recognize and fix logical errors in your program.
- Testing in single step mode (S7-300/400 only)

  You can test blocks you created in STL or SCL in the single step mode. You do this by setting breakpoints in the program code at which program execution stops. You can then continue to run the program one step at a time. Within a CPU, you can test either with program status or in single step mode. You cannot, however, use both test options at the same time within a CPU.
- Testing with the watch table

  With the watch table, you can monitor and modify the current values of individual tags in the user program or on a CPU. You can assign values to individual tags for testing and run the program in a variety of different situations. You can also assign fixed values to the I/O outputs of a CPU in STOP mode, for example to check the wiring.
- Testing with the force table

  With the force table, you can monitor and force the current values of individual tags in the user program or on a CPU. When you force, you overwrite individual tags with specified values. This allows you to test your user program and run through various situations.

  When forcing, make sure that you keep to the necessary safety measures for forcing (Page 1173)!

See also

Introduction to testing with program status (Page 1128)

Introduction to testing with the watch table (Page 1133)

Introduction for testing with the force table (Page 1156)

9.4.2 Testing with program status

9.4.2.1 Testing the program

Introduction to testing with program status

Function

If you display the program status, you can monitor the execution of the program. This provides you with an overview of the values of the individual operands and the results of the logic operations and you can check whether the components of the automation system are correctly controlled.

⚠ WARNING

Testing while the plant is operating can cause serious damage to property or injury to persons if there are functional disturbances or program errors.

Make sure that no dangerous situations can arise before you conduct a test.

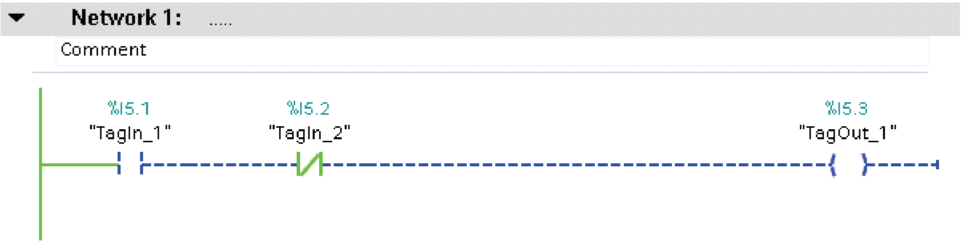
Displays in program status

Program status display for LAD programs

Displays in program status

The display of the program status is updated cyclically.

The following figure shows an example of the program status display for LAD:



Representation of the program status

You can recognize the status of individual instructions and lines of a network quickly based on the color and type of lines and symbols. The following table shows the relationship between representation and status:

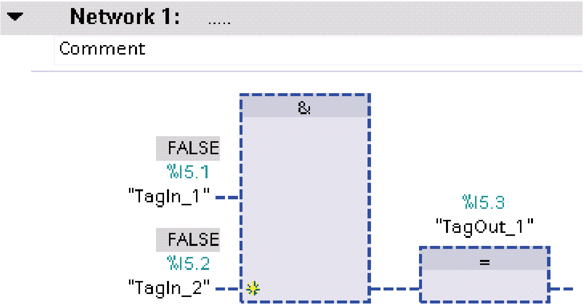
Representation	Status
Green solid	Satisfied
Blue dashed	Not satisfied
Gray solid	Unknown or not executed
Black	Not interconnected
Parameter in a frame with a saturation of 100 %	Value is current
Parameter in a frame with a saturation of 50 %	Value originates from an earlier cycle. The point in the program was not executed in the current cycle.

Program status display for FBD programs

Displays in program status

The display of the program status is updated cyclically.

The following figure shows an example of the program status display for FBD:



Representation of the program status

You can recognize the status of individual instructions and lines of a network quickly based on the color and type of lines and symbols. The following table shows the relationship between representation and status:

Representation	Status
Green solid	Satisfied
Blue dashed	Not satisfied
Gray solid	Unknown or not executed
Black	Not interconnected
Parameter in a frame with a saturation of 100 %	Value is current
Parameter in a frame with a saturation of 50 %	Value originates from an earlier cycle. The point in the program was not executed in the current cycle.

The values of the operands are displayed above the relevant operand name in a gray box.

Program status display for SCL programs

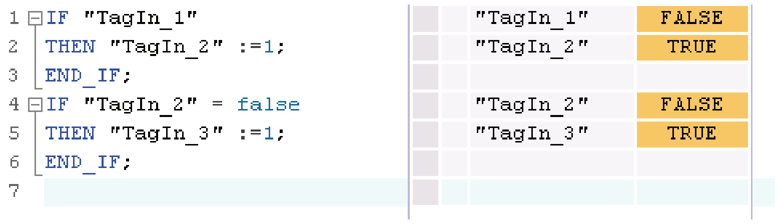
Displays in program status

The display of the program status is updated cyclically and shown in a table. The table is displayed immediately beside the SCL program and you can see the program status for each line of the program. The table contains the following information:

- Tag names
- Value

You can move the table to the left or right at any time.

The following figure shows an example of the program status display for SCL:



```
IF "TagIn_1"
THEN "TagIn_2" :=1;
END_IF;
IF "TagIn_2" = false
THEN "TagIn_3" :=1;
END_IF;

```

"TagIn_1"	FALSE
"TagIn_2"	TRUE
"TagIn_2"	FALSE
"TagIn_3"	TRUE

In the first column, you can see the name of the tag for which the current value is being displayed. If the line includes the "IF", "WHILE" or "REPEAT" instruction, the result of the instruction is displayed in the line as "True" or "False". If the line contains more than one tag, the value of the first tag is displayed. In both cases, all tags of these lines are displayed with their values in a separate list as soon as you select a line. If you place the cursor in a tag in the program code, this is shown in bold face in the list. You can also display the other tags of a line explicitly by clicking the arrow right located in front of lines containing more than one tag.

If the code of the line is not executed, the tag name is displayed in the values table in gray text.

The current values of the tags are displayed in the last column. If no values can be displayed for a tag, the line has a yellow background and three question marks are shown. In this case, select the "Create extended status information" check box in the properties of the block and download the block to the device again. All values are then displayed.

Switching test with program status on/off

You can activate the program status for all programming languages. For the graphic programming languages LAD and FBD, you can also enable the program status at a specific position or for a specific selection.

Requirement

- The identical block exists in the device.
- The block is open.

Switching the program status on or off

To switch the program status for a block on or off, follow these steps:

1. Click the "Monitoring on/off" button in the toolbar.

   If you have not already established an online connection, the "Go online" dialog opens. In this dialog, you can establish an online connection.

   See also: Establishing and terminating an online connection

Enabling program status starting at a specific point in a network

To start the program status for LAD and FBD at a specific point, follow these steps:

1. Click the "Monitoring on/off" button in the toolbar.
2. Right-click on the tag you want program status to start from.
3. Select "Modify > "Monitor from here" in the shortcut menu.

Enabling program status for selected tags

To start the program status for LAD and FBD for selected tags, follow these steps:

1. Click the "Monitoring on/off" button in the toolbar.
2. Select the tags for which you want to start the program status.
3. Select "Modify > Monitor selection" in the shortcut menu.

Note

The resources for testing with program status are limited. If there are not enough resources for the current test, earlier tests will be terminated.

Result

If you enable the display of the program status, an online connection is established and the program status is displayed. When you turn off the display of the program status, you can terminate the online connection at the same time.

If the CPU is in "HOLD" or "STOP" mode, the call hierarchy of the block is displayed in the "Call hierarchy" pane on the "Testing" task card. With S7-1200 CPUs, the call hierarchy is also displayed during the test with program status. Using this call hierarchy, you can change to one of the calling blocks.

Editing blocks during the program test

If you edit blocks while the test with program status is still running, online monitoring will be interrupted and you will be able to edit the block offline. If the block is not available offline in the project, you will first have to load it from the device to the project. After editing the block, you will also have to compile and download it again.

Procedure

To edit blocks while the test with program status is still running, follow these steps:

1. Edit the block as necessary.

   The test with program status is interrupted and the block is switched offline assuming it exists offline.
2. If the block does not exist offline, load it to the project from the device.
3. Compile the block.

   See also: Compiling blocks (Page 1071)
4. Download the block to the device.

   See also: Downloading blocks (Page 1076)

Result

The block now contains your modifications both online and offline. The online connection is re-established and testing with program status continues.

Modifying tags in the program status

While testing with the program status, you have the option of modifying tags to the following values once and immediately:

- Modify to 1

  Modifies tags of the "Bool" data type to the value "True".
- Modify to 0

  Modifies tags of the "Bool" data type to the value "False"
- Modify operand

  You can enter a modify value for tags that do not belong to the "Bool" data type.

Note that you cannot modify peripheral inputs, for example, via TagName:P.

Procedure

To modify tags during testing with the program status, proceed as follows:

1. Right-click on the tag you want to modify.
2. Select one of the following commands in the shortcut menu:
   - "Modify > Modify to 1"
   - "Modify > Modify to 0"
   - "Modify > Modify operand"
3. If you select "Modify operand", the "Modify operand" dialog opens. Enter the value you require in the "Modify value" box and confirm with "OK".

9.4.3 Testing with the watch table

9.4.3.1 Introduction to testing with the watch table

Overview

The following functions are available in the watch table:

- Monitoring tags
  This displays the current values of the individual tags of a user program or a CPU on the programming device or PC.
- Modifying tags
  You can use this function to assign specific values to the individual tags of a user program or CPU. Modifying is also possible with Test with program status .
- "Enable peripheral outputs" and "Modify now"
  These two functions enable you to assign specific values to individual peripheral outputs of a CPU in STOP mode. You can also use them to check your wiring.

Monitoring and modifying tags

The following tags can be monitored and modified:

- Inputs, outputs, and bit memory
- Contents of data blocks
- I/O

Possible applications

The advantage of the watch table is that a variety of test environments can be stored. This enables you to reproduce tests during commissioning or for service and maintenance purposes.

See also

Creating and editing watch tables (Page 1137)

Layout of the watch table (Page 1134)

Basic mode and expanded mode in the watch table (Page 1135)

Icons in the watch table (Page 1136)

9.4.3.2 Layout of the watch table

Introduction

A watch table contains the tags you defined for the entire CPU. A "Watch and force tables" folder is automatically generated for each CPU created in the project. You create a new watch table in this folder by selecting the "Add new Watch table" command.

Layout of the watch table

The columns displayed in the watch table depend on the mode you are working in: basic mode or expanded mode.

The following additional columns are shown in expanded mode:

- Monitor with trigger
- Modify with trigger

The names of the columns can also be changed dynamically based on the action.

Meaning of the columns

The following table shows the meaning of the individual columns in basic mode and expanded mode:

Mode	Column	Meaning
Basic mode	i	Identifier column
	Name	Name of the inserted tag
	Address	Address of the inserted tag
	Display format	Selected display format
	Monitor value	Values of the tags, depending on the selected display format.
	Modify value	Value with which the tag is modified.
	⚡	Select the tag to be modified by clicking the corresponding check box.
	Comment	Comment for documentation of the tags
The following additional columns are shown in expanded mode:	Monitor with trigger	Display of selected monitoring mode
	Modify with trigger	Display of selected modify mode

Icons in the watch table (Page 1136)

9.4.3.3 Basic mode and expanded mode in the watch table

Difference between basic mode and expanded mode in the watch table

Depending on the mode specified, the watch table displays different columns and column headings that can be used to perform different actions.

You will find a detailed list of the columns in Layout of the watch table (Page 1134).

Switching between basic mode and expanded mode

You have the following options of toggling between the basic and expanded mode:

- Click the icon "Show/hide advanced setting columns". Click this icon again to return to the basic mode.

  Or:

- Activate the check box for the "Expanded Mode" command in the "Online" menu. Deactivate this check box to return to the basic mode.

Functionality in expanded mode

The following functionality is only possible in expanded mode:

- Monitor with trigger
- Modify with trigger
- Enable peripheral outputs

Setting the monitoring and modify mode (Page 1145)

9.4.3.4 Icons in the watch table

Meaning of the icons

The following table shows the meaning of the icons in the watch table:

Icon	Meaning
▦	Identifies a table inside the project tree as a watch table.
i	Shows information in the identifier column.
⚡1	Modifies the addresses of all selected tags immediately and once. This command is executed once and as quickly as possible without reference to a defined trigger point in the user program.
⚡🕒	Modifies the addresses of all selected tags with reference to a defined trigger point in the user program.
⚡✓	Disables the command output disable of the peripheral outputs. You can then modify the peripheral outputs when the CPU is in STOP mode.
▥🕒	Displays all columns of expanded mode. If you click this icon again, the columns of expanded mode will be hidden.
▥⚡	Displays all modify columns. If you click this icon again, the modify columns will be hidden.
▷	Starts monitoring of the visible tags in the active watch table. The default setting for the monitoring mode in basic mode is "permanent". In expanded mode, you can set defined trigger points for the monitoring of tags.
1	Starts monitoring of the visible tags in the active watch table. This command is executed immediately and the tags are monitored once.
⚡	Displays the check box for the selection of tags to be modified.
🟩	Indicates that the value of the selected tag has been modified to "1".
▨	Indicates that the value of the selected tag has been modified to "0".

Icon	Meaning
=	Indicates that the address is being used multiple times.
	Indicates that the substitute value is being used. Substitute values are values that are output to the process in case of signal output module faults or are used instead of a process value in the user program in case of signal input module faults. The substitute values can be assigned by the user (e.g., retain old value).
	Indicates that the address is blocked because it is already being modified.
	Indicates that the address cannot be modified.
	Indicates that the address cannot be monitored.
F	Indicates that an address is being forced.
F	Indicates that an address is being partly forced.
F	Indicates that an associated I/O address is being fully or partly forced.
F	Indicates that an address cannot be fully forced. Example: It is indeed possible to force the address QW0:P, but it is not possible to force the address QD0:P since this address area is eventually not available on the CPU.
✖	Indicates that a syntax error occurred.
⚠	Indicates that the address is selected but at the moment e.g. has not yet been modified.

9.4.3.5 Creating and editing watch tables

Creating a watch table

Introduction

The watch table allows you to monitor and modify tags in the user program. Once you have created a watch table, you can save it, duplicate it, and print it and use it again and again to monitor and modify tags.

Requirement

A project is open.

Procedure

To create a watch table, follow these steps:

1. Click "Project view" in the status bar.

   The project view is displayed.
2. In the project tree, double-click the CPU for which you want to create a watch table.
3. Double-click the "Watch and force tables" folder and then the "Add new watch table" command.

   A new watch table is added.
4. In the "Name" column or in the "Address" column, enter the name or the absolute address for the tags that you want to monitor or modify.
5. You can select a display format from the drop-down list in the "Display format" column if you want to change this default setting.
6. Now decide whether you want to monitor or modify the entered tags and, if applicable, enter the desired values for modifying.

Opening a watch table

Requirement

A watch table has been created.

Procedure

To open a watch table, follow these steps:

1. Open the "Watch and force tables" folder below the desired CPU.
2. Double-click on the required watch table in the folder.

Result

The selected watch table opens.

Copying and pasting a watch table

Requirement

A watch table has been created.

Procedure

To copy a watch table, follow these steps:

1. Right-click the watch table that you want to copy.

2. In the context menu, select "Copy".
3. In the project tree, open the folder structure for the CPU in which you want to paste the copied watch table.
4. Right-click on the "Watch and force tables" folder.
5. In the context menu, select "Paste".
6. Alternatively, you can select the entire contents of the watch table and Drag & Drop it onto another watch table.

Result

A copy of the selected watch table is placed in the "Watch and force tables" folder of the relevant CPU.

Saving a watch table

Prerequisite

A watch table has been created.

Procedure

To save a watch table, follow these steps:

1. In the project tree select the watch table you want to save.
2. If you wish to change the preset name of the table, select the "Rename" command in the context menu and enter a new name for the table.
3. In the "Project" menu, select "Save". Note that this save operation will save the entire project.

Result

The contents of the watch table and the project are saved.

Note

You can reuse saved watch tables to monitor and modify tags when retesting your program.

9.4.3.6 Entering tags in the watch table

Basic information on entering tags in the watch table

Recommended procedure

- Select the tags whose values you want to monitor or modify, and enter them in the watch table.
- When entering tags into the watch table, please note that these tags must be previously defined in the PLC tag table.
- When entering tags, work from the outside to the inside. This means that you start by entering the tags for the inputs in the watch table. Then, you enter the tags that are affected by the inputs or that affect the outputs. Finally, you enter the tags for the outputs.

Example of filling out a watch table

- Enter the absolute address to be monitored or modified in the "Address" column.
- Enter the symbolic name for the tag in the "Name" column.
- Select the display format you require from the drop-down list in the "Display format" column, if you do not want to use the default setting.
- Now decide whether you want to monitor or modify the entered tags. Enter the desired values for modifying as well as a comment in the corresponding columns of the watch table.

Syntax check

When you enter the tags in the watch table, the syntax of each cell is checked when you exit the cell. Incorrect entries are marked in red.

Note

When you place the mouse pointer in a cell marked in red, brief information is displayed with additional notes on the error.

See also

Permitted operands for the watch table (Page 1141)

Permissible modify values for the watch table (Page 1141)

Permitted operands for the watch table

Permissible operands for the watch table

The following table shows the operands that are permitted for the watch table:

Permitted operand	Example of data type	Example (International mnemonics)
Input/output/bit memory	BOOL	I1.0, Q1.7, M10.1 I0.0:P; Q0.0:P
Input/output/bit memory	BYTE	IB1/QB10/MB100 IB1:P; QB1:P
Input/output/bit memory	WORD	IW1; QW10; MW100 IW2:P; QW3:P
Input/output/bit memory	DWORD	ID4; QD10; MD100 ID2:P; QD1:P
Data block	BOOL	DB1.DBX1.0
Data block	BYTE	DB1.DBB1
Data block	WORD	DB1.DBW1
Data block	DWORD	DB1.DBD1

Note

Please observe the following notes to work with the watch table.

- You cannot enter "DB0..." because it is used by the system!
- Peripheral outputs can be modified but not monitored.
- Peripheral inputs can be monitored but not modified.

Basic information on entering tags in the watch table (Page 1140)

Permissible modify values for the watch table

Entry of modify values in the watch table

The following table shows the operands that are permitted for the entry of modify values in the watch table:

Table 9- 14 Bit operands

Possible bit operands	Example for permitted modify values
I1.0	True
M1.7	False
Q1.0	0
Q1.1:P	1
DB1.DBX1.1	2#0
M1.6	2#1

Table 9- 15 Byte operands

Possible byte operands	Example for permitted modify values
IB1	2#00110011
MB12	B#16#1F
QB10	1F
QB11:P	'a'
DB1.DBB1	10

Table 9- 16 Word operands

Possible word operands	Example for permitted modify values
IW1	2#0011001100110011
MW12	W#16#ABCD
MW14	ABCD
QW10	B#(12, 34)
QW12:P	12345
DB1.DBW1	'ab'
MW16	S5T#9s_340ms
MW18	C#123
MW9	D#2006-12-31

Table 9- 17 Double word operands

Possible double word operands	Example for permitted modify values
ID1	2#00110011001100110011001100110011
QD10	Dw#16#abcdef10
QD12:P	ABCDEF10
DB1.DBD2	b#(12,34,56,78)
MD8	L#-12
MD12	L#12
MD16	123456789

Possible double word operands	Example for permitted modify values
MD20	123456789
MD24	T#12s345ms
MD28	Tod#1:2:34.567
MD32	P#e0.0

Overview of the display formats

Display formats in the watch table

The display format you select specifies the representation of a tag value.

When entering the address a display format is automatically preset. If you want to change this, you can select a display format from the drop-down list in the "Display formats" column. The drop-down list only offers the display formats which are valid for this data type. The display format that appears first in the list is the pre-selected format.

Example

The following table shows the data types permitted for the watch table and their possible display formats:

Data type	Possible display formats
BOOL	Bool, Hex, BCD, Octal, Bin, Dec, Dec+/-
BYTE	Hex, BCD, Octal, Bin, Dec, Dec+/-, Character
WORD	Hex, BCD, Octal, Bin, Dec, Dec+/-, Dec_Sequence, Character, SIMATIC_Timer, Date
DWORD	Hex, BCD, Octal, Bin, Dec, Dec+/-, Dec_Sequence, Character, Floating-point number, Time of day, Timer, Pointer
SINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character
INT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, SIMATIC_Timer, Counter
DINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Floating-point number, Time of day, Timer, Pointer
USINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character
UINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, SIMATIC_Timer, Counter
UDINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Floating-point number, Time of day, Timer, Pointer
BCD16	BCD, Hex, Octal, Bin, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Date, SIMATIC_Timer, Counter
BCD32	BCD, Hex, Octal, Bin, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Floating-point number, Time of day, Timer, Pointer

Data type	Possible display formats
REAL	Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Time of day, Timer, Pointer
LREAL	Floating-point number Note: The display of LREAL in the watch table is limited to 13 digits plus exponent.
DATE	Date, Hex, BCD, Bin
TIME_OF_DAY	Time of day, Hex, BCD, Bin
TIME	Timer, Hex, BCD, Bin
DATE_AND_TIME	Date and time,
TIMER	SIMATIC_Timer, Hex, BCD, Bin
CHAR	Character, Hex, BCD, Octal, Bin, Dec, Dec+/-
STRING	Character string
POINTER	Pointer, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Floating-point number, Time of day, Timer, Number
COUNTER	Counter, Hex, BCD, Bin

For more information, refer to the description of the valid data types.

Selecting the display format for tags

Procedure

To select the display format of the tags, follow these steps:

1. Enter the desired address in the watch table.
2. Click the desired cell in the "Display format" column, and open the drop-down list.

   The permissible display formats are shown in the drop-down list.
3. Select the desired display format from the drop-down list.

Note

If the selected display format cannot be applied, the "hexadecimal" display format is automatically shown.

9.4.3.7 Monitoring tags in the watch table

Introduction to monitoring tags in the watch table

Introduction

The watch table allows you to monitor the tags of the configured input and output modules in the CPU, depending on the monitoring and modify mode (Page 1145) selected. To monitor tags, an online connection to the CPU must exist.

Options for monitoring tags

The following options are available for monitoring tags:

- Monitor now
  This command starts the monitoring of the visible tags in the active watch table immediately and once only.
- Monitor all
  This command starts the monitoring of all visible tags in the active watch table, depending on the selected watch mode:
  - In basic mode, the monitoring mode is set to "permanent" by default.
  - In expanded mode, you can specify defined trigger points for the monitoring of tags.

  Note

  If the monitoring mode is changed while in expanded mode and then a switch is made to basic mode, the monitoring mode set before will also be applied in basic mode.

CPU-specific limitations when monitoring tags

The following CPU-specific differences exist:

- CPU S7-300/400:
  CPUs from this family can monitor the first 30 characters of a string.
- CPU S7-1200:
  CPUs from this family can monitor a string up to the total size of 254 characters.

Setting the monitoring and modify mode

Introduction

By selecting the monitoring and modify mode, you specify the trigger point and the duration of the tag monitoring in the watch table and the force table.

Possible monitoring and modify modes (duration of monitoring or modifying)

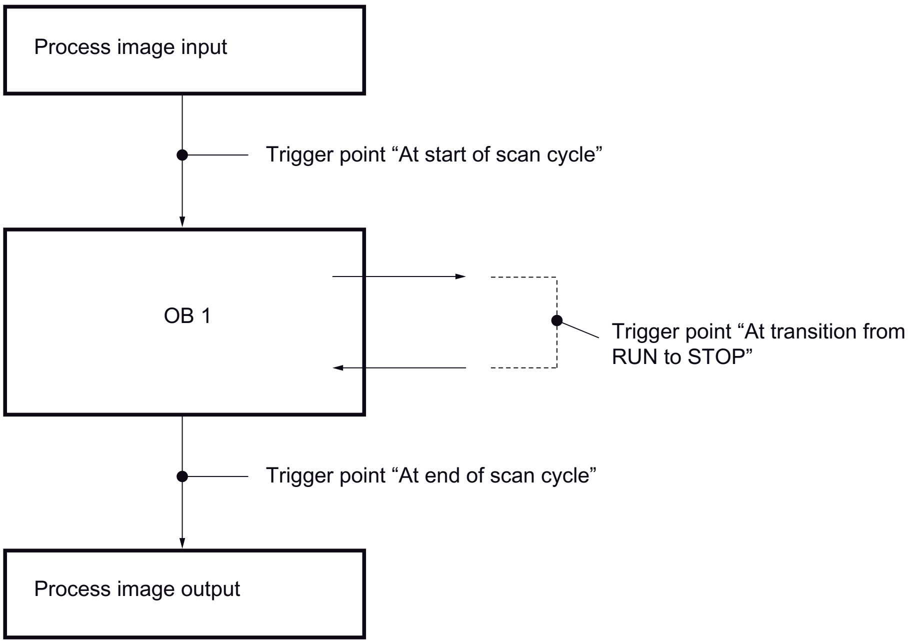
The following monitoring and modify modes are available:

- Permanent
  - In this mode, the inputs can be monitored at the start of the scan cycle and the outputs at the end.
- Once only, at start of scan cycle
- Once only, at end of scan cycle
- Permanently, at start of scan cycle
- Permanently, at end of scan cycle
- Once only, at transition to STOP
- Permanently, at transition to STOP

Selecting the trigger point

The trigger points "Beginning of scan cycle", "End of scan cycle", and "Switch to stop" specify the time at which the tags are to be read from the CPU or updated in the CPU.

The following diagram shows the position of these trigger points:



Process image input
Trigger point “At start of scan cycle”
OB 1
Trigger point “At transition from RUN to STOP”
Trigger point “At end of scan cycle”
Process image output

Position of the trigger points

From the position of the trigger points, it follows that:

- Modifying of inputs is only appropriate at the beginning of the scan cycle (corresponding to the beginning of the user program OB 1), because otherwise the process image input is updated again after modifying and is thus overwritten.
- Modifying of outputs is only appropriate at the end of the scan cycle (corresponding to the end of the user program OB 1), because otherwise the process image output can be overwritten by the user program.
- The modified value is displayed in the "Monitor value" column, provided that monitoring is active and the modified value is not overwritten by the user program.

Monitoring of tags

When tags are being modified, the following applies to the trigger points:

- If you have specified the modify mode as "once only", you will receive a message if the selected tags cannot be modified.
- In "permanent" modify mode, you do not receive a message.

Note regarding the "Modify now" command

You can modify the values of selected tags immediately using the "Online > Modify >Modify now" command. This command is executed once only and as quickly as possible without reference to a defined position (trigger point) in the user program. This function is used mainly for modifying when the CPU is in STOP mode.

"Monitor all" command for tags

Introduction

The "Monitor all" command allows you to start monitoring the visible tags in the active watch table. The default setting for the monitoring mode in basic mode of the watch table is "permanent". In expanded mode, you can specify defined trigger points for the monitoring of tags. In this case, the tags are monitored with reference to the specified trigger points.

Prerequisite

- A watch table has been created.
- An online connection to the CPU exists.

Procedure

To execute the "Monitor all" command, follow these steps:

1. Enter the tags to be monitored and the corresponding addresses in the watch table.

2. Switch to expanded mode by clicking

   the icon "Show/hide advanced setting columns" in the toolbar.
3. If you want to change the default monitoring mode for a tag, click the appropriate cell in the "Monitor with trigger" column and select the desired monitoring mode from the drop-down list.
4. Click the "Monitor all" icon in the toolbar.

Result

The tags of the active watch table are monitored using the monitoring mode selected.

See also

Icons in the watch table (Page 1136)

Entering tags in the watch table (Page 1140)

Basic mode and expanded mode in the watch table (Page 1135)

"Monitor now" command for tags

Introduction

The "Monitor now" command starts the monitoring of tags immediately without reference to defined trigger points. The tag values are read out once only and displayed in the watch table.

Requirement

- A watch table has been created.
- An online connection to the CPU exists.

Procedure

To execute the "Monitor now" command, follow these steps:

1. Enter the tags to be monitored and the corresponding addresses in the watch table.
2. Click the "Monitor now" icon in the toolbar.

Result

The tags of the active watch table are monitored immediately and once only.

See also

Icons in the watch table (Page 1136)

Entering tags in the watch table (Page 1140)

Basic mode and expanded mode in the watch table (Page 1135)

9.4.3.8 Modifying tags in the watch table

Introduction to modifying tags

Introduction

The watch table allows you to modify the tags of the configured input and output modules in the CPU, depending on the monitoring and modify mode (Page 1145) selected. To monitor the tags, an online connection to the CPU must exist.

> ⚠ DANGER
>
> **Danger when modifying:**
>
> Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors!
> Make certain that dangerous conditions cannot occur before you execute the "Modify" function.

Options for modifying tags

The following options are available for modifying tags:

- Modify to "0"

  This command modifies the selected address to the modify value "0".
- Modify to "1"

  This command modifies the selected address to the modify value "1".
- Modify once only and immediately

  This command modifies all selected addresses in the active watch table "once only and immediately".

- Modify with trigger

  This command modifies all selected addresses in the active watch table using the monitoring and modify mode (Page 1145) selected.

  The "Modify with trigger" function is only available in expanded mode. You will not receive a message indicating whether or not the selected addresses were actually modified with the specified value. You should use the "Modify once only and immediately" function if you require such a confirmation.

- Enable peripheral outputs

  This command disables the command output disable.

  This function can only be executed in expanded mode, when the CPU is in STOP and the option Force (Page 1170) of tags is not enabled. If desired, deactivate this function in the force table.

Note

When modifying, note the following:

Modifying can **not** be undone.

Modify tags to "0"

Introduction

You can assign one-time values to tags independent of the monitoring and modify mode and modify them. The modify command is executed as fast as possible, similar to a "Trigger now" command, without reference to a defined position in the user program.

⚠ DANGER

Danger when modifying:

Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors!
Make certain that dangerous conditions cannot occur before you execute the "Modify" function.

Prerequisite

- A watch table has been created.
- An online connection to the CPU exists.

Procedure

To modify tags to "0", follow these steps:

1. Enter the desired address in the watch table.

2. Select the "Online > Modify > Modify to 0" command in order to modify the selected address with the specified value.

Result

The selected address is modified to "0".

Note

When modifying, note the following:

Modifying can **not** be undone!

Modify tags to "1"

Introduction

You can assign one-time values to tags independent of the monitoring and modify mode and modify them. The modify command is executed as fast as possible, similar to a "Trigger now" command, without reference to a defined position in the user program.

DANGER

Danger when modifying:

Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors!
Make certain that dangerous conditions cannot occur before you execute the "Modify" function.

Prerequisite

- A watch table has been created.
- An online connection to the CPU exists.

Procedure

To modify tags to "1", follow these steps:

1. Enter the desired address in the watch table.
2. Select the "Online > Modify > Modify to 1" command in order to modify the selected address with the specified value.

Result

The selected address is modified to "1".

Note

When modifying, note the following:

Modifying can **not** be undone!

"Modify now" command for tags

Introduction

You can assign one-time values to tags independent of the monitoring and modify mode and modify them immediately. The modify command is executed as fast as possible, similar to a "Trigger now" command, without reference to a defined position in the user program.

⚠ DANGER

Danger when modifying:

Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors!
Make certain that dangerous conditions cannot occur before you execute the "Modify" function.

Requirements

- A watch table has been created.
- An online connection to the CPU exists.

Procedure

To modify tags immediately, follow these steps:

1. Enter the desired addresses and modify values in the watch table.
2. Select the addresses to be modified by selecting the check boxes for modifying in the column after the "Modify value".
   A yellow triangle appears behind the selected check box, indicating that the address is now selected for modifying but has not yet been modified.
3. Select the "Online > Modify > Modify once and now" command in order to immediately modify the selected address once only with the specified value.

Result

The selected addresses are modified immediately and once only.

Note

When modifying, note the following:

Modifying can **not** be undone!

"Modify with trigger" command for tags

Introduction

You can assign values to addresses dependent on the defined monitoring and modify mode and modify them. The modify command is executed as specified in the monitoring and modify mode, with reference to the defined trigger position in the user program.

⚠ DANGER

Danger when modifying:

Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors!
Make certain that dangerous conditions cannot occur before you execute the "Modify" function.

Prerequisites

- A watch table has been created.
- An online connection to the CPU exists.
- The watch table has to be in expanded mode.

Procedure

To modify tags "with trigger", follow these steps:

1. Enter the desired addresses and modify values in the watch table.
2. Select the addresses to be modified by selecting the check boxes for modifying in the column after the "Modify value".
   A yellow triangle appears behind the selected check box, indicating that the address is now selected for modifying but has not yet been modified.
3. Switch to expanded mode using the icon "Show/hide advanced settings columns" in the toolbar or the "Online > Expanded mode" command.

   The "Monitor with trigger" and "Modify with trigger" columns are displayed.

4. In the "Modify with trigger" column, select the desired modify mode from the drop-down list box. The following options are available:
   - Permanent
   - Permanently, at start of scan cycle
   - Once only, at start of scan cycle
   - Permanently, at end of scan cycle
   - Once only, at end of scan cycle
   - Permanently, at transition to STOP
   - Once only, at transition to STOP
5. Start modifying using the "Online > Modify > Modify with trigger" command.
6. Confirm the prompt with "Yes" if you want to start modifying with trigger.

Result

The selected tags are modified using the selected monitoring and modify mode. The yellow triangle is no longer displayed.

Note

When modifying, note the following:

Modifying can **not** be undone!

Enable peripheral outputs

Introduction

The "Enable peripheral outputs" function deactivates the command output disable of the peripheral outputs. You can then modify the peripheral outputs when the CPU is in STOP mode. This function is available in the watch table in "Expanded mode" only.

⚠ DANGER

Danger when enabling the peripheral outputs:

Attention, the enabling of the peripheral outputs can cause serious personal injury and material damage!
Make certain that dangerous conditions cannot occur before you execute the "Enable peripheral outputs" function.

Prerequisites

- A watch table has been created.
- An online connection to the CPU exists.
- The CPU is in STOP mode before you can enable the peripheral outputs.
- The watch table has to be in expanded mode.
- The option Force (Page 1170) of tags must not be enabled.

Note

"Enable peripheral outputs" function

- This function is possible only in STOP mode. The function is exited by an operating state change of the CPU and by the termination of the online connection.
- While the function is enabled, forcing is not possible.

Procedure

To enable the peripheral outputs in STOP mode, follow these steps:

1. Enter the desired addresses and modify values in the watch table.
2. Select the addresses to be modified by selecting the check boxes for modifying in the column after the "Modify value".
   A yellow triangle appears behind the selected check box, indicating that the address is now selected for modifying but has not yet been modified.
3. Switch to expanded mode using the icon "Show/hide advanced settings columns" in the toolbar or the "Online > Expanded mode" command.

   The "Monitor with trigger" and "Modify with trigger" columns are displayed.
4. Change the relevant CPU to STOP using the operator panel.
5. Right-click to open the shortcut menu and select "Enable peripheral outputs".
6. Confirm the prompt with "Yes" if you want to unlock the command output disable for the peripheral outputs.
7. Modify the peripheral outputs using the "Online > Modify > Modify now" command.

Result

The peripheral outputs are modified with the selected modify values. The yellow triangle is no longer displayed.

Enabling the peripheral outputs

The "Enable peripheral outputs" function remains active until:

- The "Enable peripheral outputs" command is deactivated again via the shortcut menu or via the "Online > Modify > Enable peripheral outputs" command.
- The CPU is no longer in STOP mode.
- The online connection is terminated.

Note

When modifying, note the following:

Modifying can **not** be undone!

9.4.4 Testing with the force table

9.4.4.1 Introduction for testing with the force table

Overview

You can use the force table to assign permanent values to individual tags

of the user program. This action is referred to as "forcing".

The following functions are available in the force table:

- **Monitoring tags**
  This displays the current values of the individual tags of a user program or a CPU on the programming device or PC. Tags can be monitored with or without a trigger condition.
- **Forcing tags**
  This function lets you assign a permanent value to individual peripheral tags of the user program.

Monitoring and forcing tags

The monitoring and forcing of tags is always dependent on the operand scope of the CPU used.

The following tags can be monitored:

- Inputs, outputs, and bit memories
- Contents of data blocks
- Peripheral inputs

The following tags can be forced:

- Peripheral inputs
- Peripheral outputs

Example

- Independent of the CPU used, only I/O can be forced, such as: "Tag_1":P or "QW0:P" or "IW0:P". Note that "Tag_1":P must not be the symbolic name of a bit memory.

Possible applications

One advantage of the force table is that you can simulate different test environments and overwrite tags in the CPU with a permanent value. This enables you to intervene in the ongoing process for regulating purposes.

See also

Layout of the force table (Page 1159)

Basic mode and expanded mode in the force table (Page 1160)

Icons in the force table (Page 1160)

Open and edit force table (Page 1161)

9.4.4.2 Safety precautions when forcing tags

Safety precautions when forcing tags

Because the forcing function allows you to intervene permanently in the process, observance of the following notices is essential:

⚠ DANGER

Prevent personal injury and material damage!

Note that an incorrect action when executing the "Force" function can:

- Harm persons or pose a health hazard.
- Cause damage to machinery or the entire plant.

⚠ CAUTION

Prevent personal injury and material damage!

- Before you start the "Force" function, you should ensure that no one else is currently executing this function on the same CPU.
- Forcing can only be stopped by clicking the "Stop forcing" icon or using the "Online > Force > Stop forcing" command. Closing the active force table does **not** stop the forcing!
- Forcing can **not** be undone!
- Review the differences between " modifying tags" (Page 1149) and "forcing tags" (Page 1170).
- If a CPU does not support the "Force" function, the relevant icons cannot be selected.
- If the function "Enable peripheral outputs" is active on your CPU, then forcing is **not** possible on this CPU. If desired, deactivate this function in the watch table.

9.4.4.3 Layout of the force table

Introduction

In the force table, enter the CPU-wide tags that you have defined and selected and which are to be forced in the allocated CPU. Only peripheral inputs and peripheral outputs can be forced.

For each CPU created in the project, a force table will automatically be created in the "Watch and force tables" folder. Only one force table can be allocated to a CPU. This force table displays all the addresses forced in the allocated CPU.

Layout of the force table

The columns displayed in the force table depend on the mode you are working in: basic mode or expanded mode.

In expanded mode the "Monitor with trigger" column is also displayed.

Meaning of the columns

The following table shows the meaning of the individual columns in basic mode and expanded mode:

Mode	Column	Meaning
Basic mode	i	Identification column
	Name	Name of the inserted tag
	Address	Address of the inserted tag
	Display format	Selected display format
	Monitor value	Values of the tags, dependent on the selected display format.
	Force value	Value with which the tag is forced.
	F ("Force")	Select the tag to be forced by activating the corresponding check box.
	Comment	Comment for documentation of the tags
The following additional column is shown in expanded mode:	Monitor with trigger	Display of selected monitoring mode

Basic mode and expanded mode in the force table (Page 1160)

9.4.4.4 Basic mode and expanded mode in the force table

Difference between basic mode and expanded mode in the force table

In expanded mode the "Monitor with trigger" column is also displayed in the force table.

You will find a detailed list of the columns under Layout of the force table (Page 1159).

Switching between basic mode and expanded mode

You have the following options of toggling between the basic and expanded mode:

- Click the icon "Show/hide advanced setting columns". Click this icon again to return to the basic mode.

  Or:

- Activate the check box for the "Expanded mode" command in the "Online" menu. Deactivate this check box to return to the basic mode.

Functionality in expanded mode

The "Monitor with trigger" function can only be selected in expanded mode.

9.4.4.5 Icons in the force table

Meaning of the icons

The following table shows the meaning of the icons in the force table:

Icon	Meaning
	Identifies a table inside the project tree as a force table.
i	Identification column
	Displays all columns of expanded mode. If you click this icon again, the columns of the expanded mode will be hidden.
F▷	Starts forcing for all addresses of the selected tags. If forcing is already running, the previous action is replaced without interruption.
F■	Stops forcing of addresses in the force table.
▷	Starts monitoring of the visible tags in the force table. The default setting for monitoring in basic mode is "permanent". In expanded mode an additional column is shown and you can set certain trigger points for monitoring tags.
1	Starts monitoring of the visible tags in the force table. This command is executed immediately and the tags are monitored once.
F	Displays the check box for the selection of tags to be forced.

Icon	Meaning
F⊘	Indicates that an address cannot be forced.
F⊘	Indicates that an address cannot be fully forced. Example: It is possible to force the address QW0:P, but it is not possible to force the address QD0:P because this address area is potentially not available on the CPU.
⊘	Indicates that an address cannot be monitored.
F	Indicates that an address is being forced.
F	Indicates that an address is being partly forced.
F	Indicates that the associated peripheral address is being forced.
✖	Indicates that a syntax error occurred.
⚠	Indicates that the address is selected but has not been forced yet.

9.4.4.6 Open and edit force table

Display force table

Introduction

You cannot create a new force table; one force table already exists for each CPU. It is permanently allocated to this CPU and cannot be copied or duplicated.

Requirements

A project with an allocated CPU has to be open.

Displaying a force table

The force table is always displayed below a CPU in the "Watch and force tables" folder.

Open force table

Requirements

A project with an allocated CPU must be created.

Procedure

Proceed as follows to open a force table:

1. Open the "Watch and force tables" folder below the desired CPU.
2. Double-click the "Force table" in this folder.

Result

The selected force table opens.

Save force table

Requirements

A project with an allocated CPU has been created.

Procedure

Proceed as follows to save a force table:

1. Enter the desired changes in the force table.
2. Select the "Save" command in the "Project" menu or click the "Save project" icon in the toolbar. Note that this save operation will save the entire project.

Result

The contents of the force table and the associated project are saved.

Note

You cannot rename a force table.

9.4.4.7 Entering tags in the force table

Basic principles for entering tags in the force table

Recommended procedure

Select the tags whose values you want to monitor or force, and enter them in the force table.

When entering tags in the force table, please note that these tags must be previously defined in the PLC tag table.

Example of filling out a force table

- You can enter the absolute address that is to be forced or monitored in the "Address" column or you can enter the symbolic name of the tag in the "Name" column.
- Select the display format you require from the drop-down list in the "Display format" column, if you do not want to use the default setting.
- Now you have to decide whether you want to monitor or force the entered tags. Enter the required force value and a comment in the appropriate columns of the force table.
- Note that only peripheral inputs and peripheral outputs can be forced and review the Safety precautions when forcing tags (Page 1173).

Syntax check

When you enter tags in the force table, the syntax of each cell will be checked when you exit the cell. Incorrect entries are marked in red.

Note

When you place the mouse pointer in a cell marked in red, brief information is displayed with additional notes on the error.

Permitted operands for the force table

Permitted operands for the force table

The following table shows the operands that are permitted for forcing in the force table:

Permitted operand	Example of data type	Example (International mnemonics)
Peripheral input/peripheral output	BOOL	I0.0:P; Q0.0:P
Peripheral input/peripheral output	BYTE	IB1:P; QB1:P
Peripheral input/peripheral output	WORD	IW2:P; QW3:P
Peripheral input/Peripheral output	DWORD	ID2:P; QD1:P

The following table shows the operands that are permitted for monitoring in the force table:

Permitted operand	Example of data type	Example (International mnemonics)
Input/output/bit memory	BOOL	I1.0, Q1.7, M10.1 I0.0:P
Input/output/bit memory	BYTE	IB1/QB10/MB100 IB1:P

Permitted operand	Example of data type	Example (International mnemonics)
Input/output/bit memory	WORD	IW1; QW10; MW100 IW2:P
Input/output/bit memory	DWORD	ID4; QD10; MD100 ID2:P
Data block	BOOL	DB1.DBX1.0
Data block	BYTE	DB1.DBB1
Data block	WORD	DB1.DBW1
Data block	DWORD	DB1.DBD1

Note

You cannot enter "DB0..." because it is used by the system!

Permitted force values for the force table

Entering force values in the force table

The following table shows the operands that are permitted for entering force values in the force table:

Table 9- 18 Bit operands

Possible bit operands	Example for permitted force values
I1.0:P	True
I1.1:P	False
Q1.0P	0
Q1.1:P	1
I2.0:P	2#0
I2.1:P	2#1

Table 9- 19 Byte operands

Possible byte operands	Example for permitted force values
IB1:P	2#00110011
IB2:P	B#16#1F
QB14:P	1F
QB10:P	'a'
IB3:P	10

Table 9- 20 Word operands

Possible word operands	Example for permitted force values
IW0:P	2#0011001100110011
IW2:P	W#16#ABCD
QW10:P	ABCD
QW12:P	B#(12, 34)
IW4:P	'ab'
IW6:P	12345
IW8:P	S5T#9S_340ms
IW10:P	C#123
IW12:P	D#2006-12-31

Table 9- 21 Double word operands

Possible double word operands	Example for permitted force values
ID0:P	2#00110011001100110011001100110011
ID4:P	1.2
QD10:P	1.234.e4
QD14:P	Dw#16#abcdef10
ID8:P	16#ABCDEF10
ID12:P	b#(12,34,56,78)
ID16:P	L#-12
ID20:P	L#12
ID24:P	123456789
ID28:P	123456789
ID32:P	T#12s345ms
ID36:P	Tod#14:20:40.645
ID40:P	P#e0.0

Overview of the display formats

Display formats in the force table

The display format you select specifies the representation of a tag value.

When entering the address a display format is automatically preset. If you want to change this, you can select a display format from the drop-down list in the "Display formats" column. The drop-down list only offers the display formats which are valid for this data type. The display format that appears first in the list is the pre-selected format.

Example

The following table shows the data types permitted for the force table and their possible display formats:

Data type	Possible display formats
BOOL	Bool, Hex, BCD, Octal, Bin, Dec, Dec+/-
BYTE	Hex, BCD, Octal, Bin, Dec, Dec+/-, Character
WORD	Hex, BCD, Octal, Bin, Dec, Dec+/-, Dec_Sequence, Character, SIMATIC_Timer, Date
DWORD	Hex, BCD, Octal, Bin, Dec, Dec+/-, Dec_Sequence, Character, Floating-point number, Time of day, Timer, Pointer
SINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character
INT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, SIMATIC_Timer, Counter
DINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Floating-point number, Time of day, Timer, Pointer
USINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character
UINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, SIMATIC_Timer, Counter
UDINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Floating-point number, Time of day, Timer, Pointer
BCD16	BCD, Hex, Octal, Bin, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Date, SIMATIC_Timer, Counter
BCD32	BCD, Hex, Octal, Bin, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Floating-point number, Time of day, Timer, Pointer
REAL	Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Time of day, Timer, Pointer
LREAL	Floating-point number
DATE	Date, Hex, BCD, Bin
TIME_OF_DAY	Time of day, Hex, BCD, Bin
TIME	Timer, Hex, BCD, Bin
DATE_AND_TIME	Date and time,
TIMER	SIMATIC_Timer, Hex, BCD, Bin
CHAR	Character, Hex, BCD, Octal, Bin, Dec, Dec+/-
STRING	Character string
POINTER	Pointer, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Floating-point number, Time of day, Timer, Number
COUNTER	Counter, Hex, BCD, Bin

For more information, refer to the description of the valid data types.

Selecting the display format for tags

Procedure

To select the display format of the tags, follow these steps:

1. Enter the desired address in the force table.
2. Click the desired cell in the "Display format" column, and open the drop-down list.

   The permitted display formats are shown in the drop-down list.
3. Select the desired display format from the drop-down list.

Note

If the selected display format cannot be applied, then the last selected display format will be displayed automatically.

9.4.4.8 Monitoring tags in the force table

Introduction to monitoring tags in the force table

Introduction

Use the force table to monitor the tags of the configured input and output modules in the CPU, dependent on the monitoring mode (Page 1168) you have selected. An online connection to the CPU must exist to monitor tags.

Options for monitoring tags

The following options are available for monitoring tags:

- Monitor all
  This command starts the monitoring of all visible tags in the active force table, dependent on the selected monitoring mode:
  - In basic mode, the monitoring mode is set to "permanent" by default.
  - In expanded mode, you can specify defined trigger points for the monitoring of tags.

  Note

  If the monitoring mode is changed while in expanded mode and then a switch is made to basic mode, the monitoring mode set before will also be applied in basic mode.

- Monitor now
  This command starts the monitoring of the visible tags in the active force table immediately and once only.

CPU-specific limitations when monitoring tags

The following CPU-specific differences exist:

- CPU S7-300/400:
  CPUs from this family can only monitor the first 30 characters of a string.
- CPU S7-1200:
  CPUs from this family can monitor a string up to the total size of 254 characters.

Setting the monitoring mode in the force table

Introduction

By selecting the monitoring mode, you specify the trigger point and the duration of tag monitoring in the force table.

Possible monitoring mode (duration of monitoring)

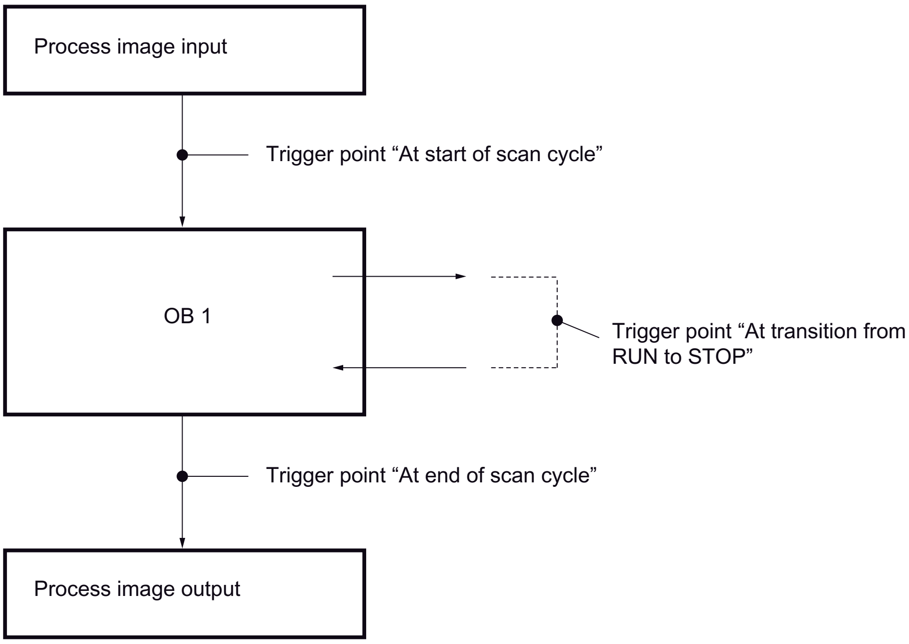
The following selection options are available:

- Permanent: In this mode, the inputs can be monitored at the start of the scan cycle and the outputs at the end.
- Once only, at start of scan cycle
- Once only, at end of scan cycle
- Permanently, at start of scan cycle
- Permanently, at end of scan cycle
- Once only, at transition to STOP
- Permanently, at transition to STOP

Selecting the trigger point

The trigger points "Beginning of scan cycle", "End of scan cycle", and "Switch to stop" specify the time at which the tags are to be read from the CPU or updated in the CPU.

The following diagram shows the position of these trigger points:



Process image input
Trigger point “At start of scan cycle”
OB 1
Trigger point “At transition from RUN to STOP”
Trigger point “At end of scan cycle”
Process image output

"Monitor all" command for tags

Introduction

Use the "Monitor all" command to start monitoring the visible tags in the active force table. In basic mode of the force table, the default setting for the monitoring mode is "permanent". In expanded mode, you can specify defined trigger points for the monitoring of tags. In this case, the tags are monitored with reference to the specified trigger points.

Requirements

- A force table has been created.
- An online connection to the CPU exists.

Procedure

To execute the "Monitor all" command, follow these steps:

1. Enter the tags to be monitored and the corresponding addresses in the force table.

2. Switch to expanded mode by clicking

   the icon "Show/hide advanced setting columns" in the toolbar.
3. If you want to change the default monitoring mode for a tag, click the appropriate cell in the "Monitor with trigger" column and select the desired monitoring mode from the drop-down list.
4. Click the "Monitor all" icon in the toolbar.

Result

The tags of the active force table will be monitored using the set monitoring mode.

"Monitor now" command for tags

Introduction

The "Monitor now" command starts the monitoring of tags immediately without reference to defined trigger points. The tag values are read out only once and displayed in the force table.

Requirements

- A force table has been created.
- An online connection to the CPU exists.

Procedure

To execute the "Monitor now" command, follow these steps:

1. Enter the tags to be monitored and the corresponding addresses in the force table.
2. Click the "Monitor now" icon in the toolbar.

Result

The tags of the active force table are monitored immediately and once only.

9.4.4.9 Forcing tags in the force table

Introduction to forcing tags

Introduction

You can use the force table to assign permanent values to individual tags of the user program. This action is referred to as forcing. Only peripheral inputs and peripheral outputs can be forced.

To use the forcing function, you must have an online connection to the CPU and the utilized CPU must support this functionality.

If you open a force table in the "Watch and force tables" folder below a CPU, all values forced in the allocated CPU will be displayed in this force table, provided that an online connection to the CPU exists.

Possible applications

By permanently assigning defined values to tags, you can specify defined default settings for your user program and, thus, test the programmed functions. Forcing is possible in basic mode and in expanded mode (Page 1160).

Caution when forcing tags

Before forcing, you must review the safety precautions (Page 1173) for this procedure.

⚠ DANGER

Prevent personal injury and material damage!

Note that an incorrect action when executing the "Force" function can:

- Harm persons or pose a health hazard.
- Cause damage to machinery or the entire plant.

Options for forcing tags

The following options are available for forcing tags:

- Force to "0"

  This command forces the selected address in the CPU to the force value "0".

- Force to "1"

  This command forces the selected address in the CPU to the force value "1".

- Force all

  This command starts the forcing of enabled addresses in the active force table or replaces an existing force job without interruption.

- Stop forcing

  This command stops the forcing of all addresses in the active force table.

Constraints when forcing tags

Note the following constraints when forcing:

- Forcing is always dependent on the operand scope of the CPU used.
- In principle, only peripheral inputs and peripheral outputs can be forced.
- If the function "Enable peripheral outputs" is active on your CPU, then forcing is not possible. If desired, deactivate this function in the watch table.

Unique aspects when forcing tags

Note that forcing of tags will overwrite values in the CPU and will continue even after the online connection to the CPU is terminated.

- Stop forcing

  Terminating the online connection is not sufficient to stop the forcing operation! To stop forcing, you must select the "Online > Force > Stop forcing" command. Only then will the tags that are visible in the active force table no longer be forced.

- Stop forcing of individual tags

  The "Online > Force > Stop forcing" command always applies to all tags displayed in the force table. To stop forcing individual tags, you must clear the check mark for forcing of these tags in the force table and restart forcing using the "Online > Force > Force all" command.

Safety precautions when forcing tags

Safety precautions when forcing tags

Because the forcing function allows you to intervene permanently in the process, observance of the following notices is essential:

⚠ DANGER

Prevent personal injury and material damage!

Note that an incorrect action when executing the "Force" function can:

- Harm persons or pose a health hazard.
- Cause damage to machinery or the entire plant.

⚠ CAUTION

Prevent personal injury and material damage!

- Before you start the "Force" function, you should ensure that no one else is currently executing this function on the same CPU.
- Forcing can only be stopped by clicking the "Stop forcing" icon or using the "Online > Force > Stop forcing" command. Closing the active force table does **not** stop the forcing!
- Forcing can **not** be undone!
- Review the differences between " modifying tags" (Page 1149) and "forcing tags" (Page 1170).
- If a CPU does not support the "Force" function, the relevant icons cannot be selected.
- If the function "Enable peripheral outputs" is active on your CPU, then forcing is **not** possible on this CPU. If desired, deactivate this function in the watch table.

Force tags to "0"

Introduction

You can use the force function to assign permanent values to individual tags of a user program.

Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 1173).

> ⚠ DANGER
>
> **Prevent personal injury and material damage!**
>
> Note that an incorrect action when executing the "Force" function can:
>
> - Harm persons or pose a health hazard.
> - Cause damage to machinery or the entire plant.

Requirements

- A force table has been created.
- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is **not** enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

Procedure

To force tags to "0", follow these steps:

1. Open the force table.
2. Enter the desired address in the force table.
3. Select the "Online > Force> Force to 0" command in order to force the selected address with the specified value.
4. Confirm the next dialog with "Yes".

Result

The selected address is forced to "0". The yellow triangle is no longer displayed. A red "F" is displayed in the first column, for example, indicating that the tag is being forced.

Stop forcing

To stop forcing, follow these steps:

1. Open the force table.
2. Select the "Online > Force > Stop forcing" command.
3. Confirm the next dialog with "Yes".

Result

Forcing of the selected values is stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is selected for forcing but is not being forced at the moment.

Note

When forcing, note the following:

- Forcing can **not** be undone!
- Terminating the online connection does **not** stop the forcing!
- To stop forcing, the forced address must be visible in the active force table.

Force tags to "1"

Introduction

You can use the force function to assign permanent values to individual tags of a user program.

Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 1173).

⚠ DANGER

Prevent personal injury and material damage!

Note that an incorrect action when executing the "Force" function can:

- Endanger the life or health of personnel
- Cause damage to machinery or the entire plant.

Requirements

- A force table has been created.
- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is **not** enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

Procedure

To force tags to "1", follow these steps:

1. Open the force table.
2. Enter the desired address in the force table.
3. Select the "Online > Force> Force to 1" command in order to force the selected address with the specified value.
4. Confirm the next dialog with "Yes".

Result

The selected address is forced to "1". The yellow triangle is no longer displayed. A red "F" is displayed in the first column, for example, indicating that the tag is being forced.

Stop forcing

To stop forcing, follow these steps:

1. Open the force table.
2. Select the "Online > Force > Stop forcing" command.
3. Confirm the next dialog with "Yes".

Result

Forcing of the selected values is stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is selected for forcing but is not being forced at the moment.

Note

When forcing, note the following:

- Forcing can **not** be undone!
- Terminating the online connection does **not** stop the forcing!
- To stop forcing, the forced address must be visible in the active force table.

"Force all" command for tags

Introduction

You can use the force function to assign permanent values to individual tags of a user program.

If forcing is already active, this forcing operation is replaced without interruption by the "Online > Force > Force all" command. Any forced addresses that are not selected will no longer be forced.

Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 1173).

⚠ DANGER

Prevent personal injury and material damage!

Note that an incorrect action when executing the "Force" function can:

- Harm persons or pose a health hazard.
- Cause damage to machinery or the entire plant.

Requirements

- A force table has been created.
- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is **not** enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

Procedure

To force tags with the "Online > Force > Force all" command, follow these steps:

1. Open the force table.
2. Enter the desired addresses and force values in the force table.
3. Select the addresses to be forced by selecting the check boxes for forcing in the column after the "Force value".
   A yellow triangle appears behind the selected check box, indicating that the address is selected for forcing but is not being forced at the moment.
4. Select the "Online > Force> Force all" command in order to force the selected addresses with the specified values.
5. Confirm the next dialog with "Yes".

Result

The selected addresses are forced to the specified values. The yellow triangle is no longer displayed. A red "F" is displayed in the first column, for example, indicating that the tag is being forced.

Stop forcing

To stop forcing, follow these steps:

1. Open the force table.

2. Select the "Online > Force > Stop forcing" command.
3. Confirm the next dialog with "Yes".

Result

Forcing of the selected addresses is stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is selected for forcing but is not being forced at the moment.

Note

When forcing, note the following:

- Forcing can **not** be undone!
- Terminating the online connection does **not** stop the forcing!
- To stop forcing, the forced address must be visible in the active force table.

9.4.4.10 Stop forcing tags

Stop forcing all tags

Introduction

Note the following before you stop forcing tags:

- The stopping of forcing can **not** be undone!
- Terminating the online connection does **not** stop the forcing!
- To stop forcing, the forced address must be visible in the active force table.

Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 1173).

⚠ DANGER

Prevent personal injury and material damage!

Note that an incorrect action when stopping the "Force" function can:

- Harm persons or pose a health hazard.
- Cause damage to machinery or the entire plant.

Requirements

- A force table has been created in which tags are being forced.
- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is not enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

Procedure

Proceed as follows to stop **forcing all tags** :

1. Open the force table.
2. Select the "Online > Force > Stop forcing" command in order to stop forcing the displayed addresses.
3. Confirm the "Stop forcing" dialog with "Yes".

Result

The forcing of all tags is stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is flagged for forcing but is not being forced at the moment.

Stop forcing individual tags

Introduction

Note the following before you stop forcing tags:

- The stopping of forcing can **not** be undone!
- Terminating the online connection does **not** stop the forcing!
- To stop forcing, the forced address must be visible in the active force table.

Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 1158).

⚠ DANGER

Prevent personal injury and material damage!

Note that an incorrect action when stopping the "Force" function can:

- Harm persons or pose a health hazard.
- Cause damage to machinery or the entire plant.

Requirements

- A force table has been created in which tags are being forced.
- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is not enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

Procedure

Proceed as follows to stop **forcing individual tags** :

1. Open the force table.
2. Deactivate the check boxes for the addresses that are no longer to be forced.
3. Reselect the "Online > Force" command.

Result

Forcing of the disabled addresses will be stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is flagged for forcing but is not being forced at the moment.

9.5 Configuring alarms

9.5.1 Introduction to alarm configuration

Overview

Alarms allow you to detect errors in process control in the automation system quickly, to localize them precisely, and to eliminate them. This leads to a significant reduction in down times in the plant.

Before alarms can be output, they need to be configured.

You can create, edit and compile event-dependent alarms along with their alarm texts and alarm attributes and display them on display devices.

The table below lists the alarm types along with a brief description of their functions.

Alarm type	Description
PLC alarms	PLC alarms are used to report program-synchronous event and are each assigned a block. They are created in the program editor and edited in the alarm editor.
User diagnostic alarms	Using user diagnostic alarms you can write a user entry in the diagnostics buffer and send an appropriate alarm. They are assigned a CPU. They are created in the alarm editor and be edited there.
System alarms	System alarms are configuration-dependent module events and are activated or deactivated in the hardware configuration. They can only be viewed in the alarm editor, but not edited.

9.5.2 Assigning alarm numbers

Assigning numbers

The alarms are identified by a number that is unique within the CPU. This means that it is not necessary to recompile after copying complete programs. Copying a single block is an exception to this rule. Here, recompilation is necessary to include the changed alarm number in the program.

9.5.3 Components of an alarm

Overview

How an alarm is displayed depends on the alarm method, the alarm block used and the display device.

The possible components of an alarm are listed in the following table:

Component	Description
Time stamp	Generated when the alarm event occurs in the automation system.
Alarm state	The following are possible: Incoming, outgoing, outgoing without acknowledgment, outgoing with acknowledgment.
Associated value	With some alarms, it is possible to add a process value that can be evaluated by the alarm instruction being used.
Image	If there is a system crash, the resulting alarms can be displayed later on HMI devices.
Alarm number	A number assigned by the system that is unique within the CPU and identifies an alarm.
Alarm texts	Are configured by the user.

9.5.4 Available alarm blocks

Overview of the alarm blocks

You can select among the following alarm blocks:

- ALARM
- ALARM_8
- ALARM_8P
- NOTIFY
- ALARM_S
- ALARM_SQ
- AR_SEND (for sending archives; no configuration of alarm texts and alarm attributes possible)
- NOTIFY_8P
- ALARM_DQ
- ALARM_D

When do I use which alarm block?

The following table will help you to decide which alarm block to use for your application. The choice of alarm block depends on the following factors:

- The number of channels available in the block and therefore the number of signals to be monitored per block call.
- The possibility of acknowledging alarms.
- The possibility of including associated values.
- The display devices to be used.
- The configuration limits of the CPU.

Alarm block	Channels	Acknowl-edgement	Associated values	Special features
ALARM	1	possible	up to 10	Sends an alarm on rising or falling edge
ALARM_8	8	possible	no	Sends an alarm on rising or falling edge of one or more signals
ALARM_8P	8	possible	up to 10	as ALARM_8
NOTIFY	1	no	up to 10	as ALARM
NOTIFY_8P	8	no	up to 10	as NOTIFY
AR_SEND	1	-	-	Used to send an archive; no configuration of alarm texts and alarm attributes possible
ALARM_SQ	1	possible	1	With each block call and a signal change compared with the previous block call, an alarm is generated
ALARM_S	1	no	1	as ALARM_SQ
ALARM_DQ	1	possible	1	as ALARM_SQ
ALARM_D	1	no	1	as ALARM_SQ

9.5.5 Alarm type and alarms

Using the program and alarm editors, you have the option of creating either an alarm type (i.e. an FB as template for instance DBs) or alarms themselves (i.e. instance DBs as template of an alarm type).

The block with alarm capability can be an FB or an instance DB

- With an FB you create an alarm type that serves as a template for alarms. All the input you make for the alarm type is automatically included for alarms derived from it. If you assign an instance DB to the FB, messages are generated automatically for the instance DB according to the template of the alarm type and alarm numbers are assigned.
- With an instance DB, you can modify the alarms generated based on the alarm type for the specific instance.

The visible difference is that alarm numbers are assigned to alarms whereas they are not assigned to an alarm type. The alarm types and corresponding instances are arranged one under the other in the alarm editor.

Locking the data for an alarm type

You enter texts and attributes for event-dependent alarms in the alarm editor. While you are doing this, you can, for example, specify how the alarms are displayed on certain display devices (for example using the alarm class). Use the alarm types as templates to facilitate creation of alarms.

- When you enter data (attributes and texts) for the alarm type, you can specify whether or not they are locked. If you lock attributes, the icon of a closed chain link is shown beside the input box. If the attribute is not locked, the chain link is open.
- If you lock data in the alarm type, you can no longer change this in the alarms of the specific instance. The data is simply displayed.
- If, however, you want to make changes, you will need to go back to the alarm type, cancel the lock and make any changes there. The changes do not, however, apply to instances generated prior to the change.

Changing the data for an alarm type

If you change data for an alarm type, these changes are automatically included in the instances.
Exceptions: You have already changed this data in the instance or have locked or unlocked data later in the alarm type.

Note

If you copy instances to a different program without copying the alarm type, then the instance will not be completely displayed. In this case, copy the alarm type to the new program as well.

Resetting instance-specific data to the value of the alarm type

If attributes or texts were overwritten in an alarm instance, a type icon is displayed beside the attribute. You can decide whether to use the value of the alarm type again for each attribute. In this case, no type icon is displayed.

See also

Creating and editing an alarm type (Page 1189)

Creating and editing an instance DB (Page 1189)

9.5.6 Formal parameters, alarm data types and alarm blocks

Formal parameters as alarm number inputs

For each alarm or group of alarms, you require a formal parameter (name of the alarm) in your program that you specify as an IN parameter in the tag overview of your program. The formal parameter is used as an alarm number input and forms the basis for an alarm.

Supplying the formal parameter with the suitable data type

The formal parameter must be assigned an alarm data type in keeping with the alarm block being used.

Alarm data types and corresponding alarm blocks

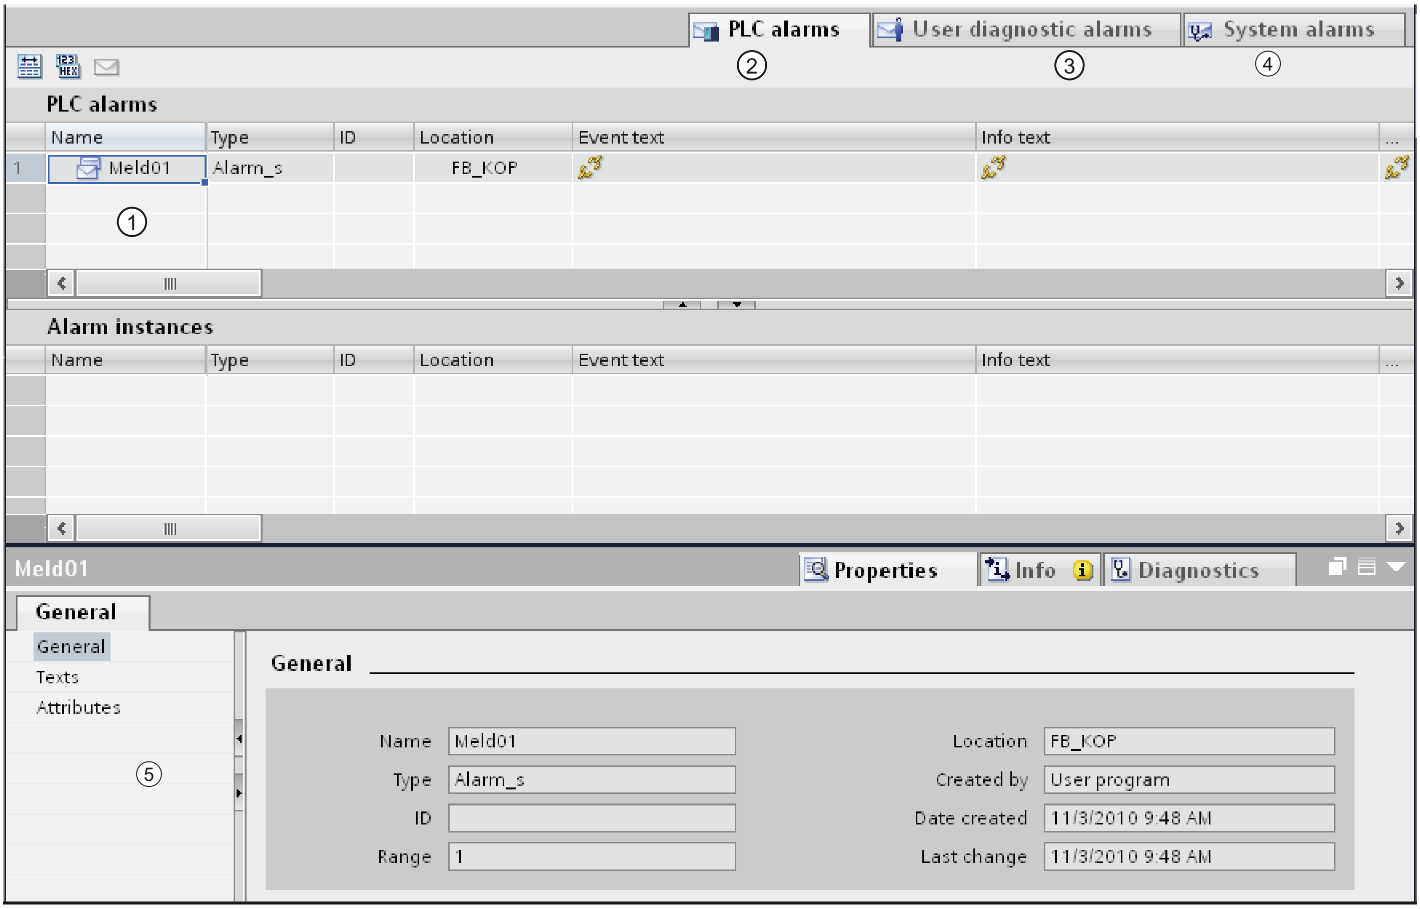
The following table shows the alarm data types with their corresponding alarm blocks and their properties. The values of the data types have the same names as those of the alarm blocks (exception: "alarm_s") and and have the prefix "C_".

Data type	Alarm block	Properties
C_Alarm_8	ALARM_8	8 channels, acknowledgment possible, no associated values
C_Alarm_8p	ALARM_8P	8 channels, acknowledgment possible, up to 10 associated values per channel
C_Notify	NOTIFY	1 channel, no acknowledgment, up to 10 associated values
C_Alarm	ALARM	1 channel, acknowledgment possible, up to 10 associated values
C_Alarm_s	ALARM_S	1 channel, no acknowledgment, up to 1 associated value
C_Alarm_s	ALARM_SQ	1 channel, acknowledgment possible, up to 1 associated value
C_Ar_Send	AR_SEND	Used to send an archive
C_Notify_8p	NOTIFY_8P	8 channels, no acknowledgment, up to 10 associated values
C_Alarm_s	ALARM_DQ	1 channel, acknowledgment possible, up to 1 associated value
C_Alarm_s	ALARM_D	1 channel, no acknowledgment possible, up to 1 associated value

9.5.7 Layout of the alarm editor

Layout of the alarm editor

The following graphic shows the components of the alarm editor:



PLC alarms

	Name	Type	ID	Location	Event text	Info text	...
1	Meld01	Alarm_s		FB_KOP			

Alarm instances

Name	Type	ID	Location	Event text	Info text	...

General

Name	Meld01	Location	FB_KOP
Type	Alarm_s	Created by	User program
ID		Date created	11/3/2010 9:48 AM
Range	1	Last change	11/3/2010 9:48 AM

①	Table showing the alarms in the work area.
②	"PLC alarms" tab: You can edit PLC alarms here.
③	"User diagnostic alarms" tab: You can create and edit user diagnostic alarms here.
④	"System alarms" tab: System alarms can only be viewed and cannot be edited.
⑤	Inspector window

You can enter or modify the texts and attributes in the table or in the Inspector window.

9.5.8 Creating and editing alarms

9.5.8.1 Creating PLC alarms

Prerequisites

You have created a function block.

Procedure

To configure a PLC alarm, follow these steps:

1. Select the function block (FB) for which you want to create a PLC alarm in the "Program blocks" folder in the project navigation and double-click on the block to open it.
2. Fill in the block interface. For each alarm block that will be called in the FB, you will need to declare tags in the calling FB.
   To achieve this for example, enter the following variables:
   – For the "IN" parameter, a name for the alarm block input, for example "Alarm01" (for alarm input 01) and the data type.
3. In the instruction window of the FB, insert the call for the selected alarm block, e.g. "CALL ALARM_S" and complete your input with the RETURN key.

   Result: The statement part of the FB displays the input tags of the called alarm block, in this case the ALARM_S block.
4. Assign the name for the alarm block input you named in step 2 to the "EV_ID" tag, in this case "Alarm01".

   Note

   If, instead of an alarm block in the CPU, you call an FB with multiple instances in which alarms are also configured, you would also need to configure the alarms of the FB with multiple instances in the calling block.
5. Repeat steps 2 through 4 for all alarm block calls in this FB.

9.5.8.2 Edit PLC alarms in the alarm editor

Prerequisites

You have created a PLC alarm.

Procedure

To edit PLC alarms, follow these steps:

1. Double-click "PLC alarms" in the project navigation. The alarm editor opens.
2. Enter the required texts and attributes in the appropriate columns.

> **Note**
>
> When you edit alarm types, you can lock texts and attributes. You can do this by clicking on the icon in front of the relevant column.
>
> If you edit alarms in instance DBs in which the texts/attributes are not locked in the alarm type, a type icon is displayed in front of the relevant column. When you click on this icon, modified texts/attributes are reset to the values of the alarm type.

9.5.8.3 Edit PLC alarms in the program editor

Prerequisites

You have created a PLC alarm.

Procedure

To edit PLC alarms, follow these steps:

1. Select the appropriate line in the block interface.
2. Move to the "Alarm" tab in the inspector window and select the required group.
3. Enter the required texts and attributes in the appropriate fields.

> **Note**
>
> When you edit alarm types, you can lock texts and attributes. You can do this by clicking on the icon next to the relevant field.
>
> If you edit alarms in instance DBs in which the texts/attributes are not locked in the alarm type, a type icon is displayed next to the relevant field. When you click on this icon, modified texts/attributes are reset to the values of the alarm type.

9.5.8.4 Deleting PLC alarms

Procedure

To delete a PLC alarm, follow these steps:

1. Open the block containing the alarm you want to delete.
2. Select the corresponding line in the block interface and select "Delete" in the shortcut menu.

Result

The alarm is deleted.

9.5.8.5 Creating and editing an alarm type

Procedure

To edit an alarm type, follow these steps:

1. Select the required alarm block.
2. Enter the texts you require in the appropriate columns or select the required attributes. If you have selected a multichannel alarm block (for example, "ALARM_8"), you can assign a separate text and certain separate attributes to each subnumber.
3. If you do not want the texts or attributes of the instance to be changed, lock them in the alarm type.

9.5.8.6 Creating and editing an instance DB

Prerequisites

You have already created an FB and created at least one alarm in it.

Procedure

To assign instance data blocks (DBs) to an alarm type and to edit the alarms for these DBs for specific instances, follow the steps below:

1. Double-click on "Add new block" in the project navigation, click on the "Data block (BD)" button that appears in the dialog and select the function block (alarm type) to which you want to assign the instance DB from the "Type" drop-down list.

2. Now click in the inspector window on the "Alarm" tab and select the group you want.
   Or:
   Double-click in the project navigation on "PLC alarms" to open the alarm configuration.
3. Make the changes you require for the particular instance DB.

> **Note**
>
> If the properties of the instance DB are write-protected then you must first unlock them in alarm type (FB).

Result

This completes the alarm configuration for the selected instance DB.

9.5.8.7 Creating user diagnostic messages

User diagnostic alarms are assigned to a CPU. They are created and edited in the alarm editor.

Procedure

To configure a user diagnostic alarm, follow these steps:

1. Double-click on the "PLC alarms" folder in project navigation to open the alarm editor.
2. Select the "User diagnostic alarms" tab in the alarm editor.
3. Click in the table and select "Insert new alarm" in the shortcut menu.

Result

You have created a user diagnostic alarm.

9.5.8.8 Editing user diagnostic alarms

Prerequisites

You have created a user diagnostic alarm.

The alarm editor is open.

Procedure

To edit a user diagnostic alarm, follow these steps:

1. Enter the required texts and attributes in the appropriate columns.

9.5.8.9 Deleting user diagnostic messages

You can delete a selected alarm. The texts you configured for this alarm are deleted and the alarm number is released for use.

Procedure

Follow the steps below to delete a user diagnostic message:

1. Select the corresponding row in the table and select "Delete" in the shortcut menu.

Result

The alarm is deleted. It is no longer displayed in the table.

9.5.8.10 Entering texts

You can enter the texts for alarms manually or you can use the default values.

Text template from the alarm type

All the texts in the alarm type are available as a template for creating alarm texts. If the alarm type already contains a general text, all instances of this alarm type include the same attributes and texts. Where necessary, you simply need to modify them.

Info text

The info text is a text that can be specified for certain display devices. With certain groups of devices (for example WinCC), it can be changed during run time.

Additional texts

Additional texts are texts that can be displayed by certain HMI devices. Click in the relevant row and type in the text. If you want to protect the text from being overwritten, click the option in the column. The texts can include line breaks.

See also

Locking texts (Page 1192)

9.5.8.11 Locking texts

"Locked" option in the alarm type

You can only lock texts when you edit the alarm type. The locked texts in alarms derived from the alarm type are write-protected. The icon displayed beside the input field indicates whether or not they are locked.

Locking texts

Follow the steps below to lock texts:

1. Start by editing the alarm types.
2. Click on the icon beside the input box you want to lock.

   Result: The icon changes to a closed chain link.

Unlocking texts

To unlock texts, follow the steps below:

1. Start by editing the alarm types.
2. Click on the icon beside the input box you want to unlock.

   Result: The icon changes to an open chain link.

9.5.8.12 Locking attributes

Locking attributes in the alarm type

You can only lock attributes when you edit the alarm type. The locked attributes in alarms derived from the alarm type are write-protected. The icon displayed in front of the input field indicates whether or not they are locked.

Locking attributes

Follow the steps below to lock attributes:

1. Start by editing the alarm types.
2. Click on the icon to the left of the input box you want to lock in the table.

   Result: The icon changes to a closed chain link.

Unlocking attributes

Follow the steps below to unlock attributes:

1. Start by editing the alarm types.
2. Click on the icon to the left of the input box you want to unlock in the table.

   Result: The icon changes to an open chain link.

9.5.8.13 Insert associated values in alarms

To add current information to alarms, e.g. from the process, you can insert associated values at any location within an alarm text.

Procedure

To insert an associated value into an alarm, follow these steps:

1. Configure a block as follows:
   @<No. of associated value><Element type><Format>@.
2. Insert this block at the locations in the alarm text at which the associated value is to be shown.

See also

Structure of associated values (Page 1194)

Examples of associated values (Page 1195)

9.5.8.14 Structure of associated values

Associated values are comprised of the following:

Element type

This uniquely configures the data type of the associated value:

Element type	Data type
Y	BYTE
W	WORD
X	DWORD
I	Integer
D	DINT
B	BOOL
C	CHAR
R	REAL

The element type only uniquely identifies the data type transferred by the AS. It is not used as Casting Operator.

Format

Determine the output format for the associated value on the display device. The format is preceded by the "%" sign. The following fixed formats apply to alarm texts:

Format	Description
%[i]X	Hexadecimal number with i digits
%[i]u	Decimal number without sign with i digits
%[i]d	Decimal number with sign with i digits
%[i]b	Binary number with i digits
%[i][.y]f	Fixed number of points Signed value of the form dddd: one or more numbers with y digits after the decimal point and total number of digits i
%[i]s	String (ANSI string) with i digits Characters are printed up to the first 0 Byte (00Hex).
%t#<Name of text library>	Access to text library

If the format is too small then the value is nevertheless output in full.

If the format is too large then an appropriate number of empty characters are output before the value.

Note

Please note that you can optionally enter "[i]", without the square brackets.

See also

Insert associated values in alarms (Page 1193)

Examples of associated values (Page 1195)

9.5.8.15 Examples of associated values

Examples of associated values:

@1I%6d@: The value from associated value 1 is shown as a decimal number with a max. 6 digits.

@2R%6f@: The value "5.4", for instance from associated value 2, is shown as a fixed number of points "5.4" (three leading blanks).

@2R%2f@: The value "5.4", for instance from associated value 2, is shown as a fixed number of points "5.4" (if number of digits is too small then these are not cut off).

@1W%t#Textbib1@: Associated value 1 of the WORD data type is the index by which the text to be inserted is referenced in the Textbib1 text library.

Note

If you want to transfer more than one associated value to an ALARM_S block then you can transfer an array with a max. length of 12 bytes. These could be, e.g. maximum 12 Byte or Char, maximum 6 Word or Int or maximum 3 DWord, Real or Dint.

See also

Insert associated values in alarms (Page 1193)

Structure of associated values (Page 1194)

9.5.8.16 Deleting associated values

You can delete associated values by deleting the string that represents an associated value in the alarm text.

Procedure:

Follow the steps below to delete associated values:

1. Find the block in the alarm text that corresponds to the associated value you want to delete.
   The block begins with the "@" character followed by the location ID by which you can recognize the associated value, there is then format information and it ends with the "@" character.
2. Delete the block you have found from the alarm text.

9.5.9 Text lists for alarms

9.5.9.1 Basics of alarm text lists

You can adapt existing text lists (user-defined and system-defined text lists) to your requirements and edit texts and attributes. You can then translate the texts into the project language(s) you want to use.

Detailed information on text lists is contained in the "Working with text lists" chapter.

9.5.9.2 Editing text lists for alarms

Requirement

- The user interface language and the project language must be the same during editing.

Procedure

Follow the steps below to edit text lists:

1. Double-click on the "Text lists" command below "Common data" in project navigation or select the context command "Go to text list" in the alarm editor.

   The text list editor opens.
2. Select the text list you want to edit from the table.
3. Change the values as required.

You can change the following values:

- Text titles:
  With the exception of the Info text, the titles for the alarm texts (alarm text, additional texts) can be freely configured to suit your purposes.
- Names of attribute values:
  Many of the names for attribute values (for example Priority, Display class, ...) can be configured freely. The index in the system text list matches the index in the selection box of the corresponding attribute in the alarm editor.
  Example: If you enter the text "Priority_0" at index 0 in the priority text list, the same text will be displayed at the first position in the selection box in the alarm editor.

9.5.9.3 Integrating texts from text lists in alarms

You can integrate any number of texts in an alarm from various text lists. The texts can be positioned anywhere you want which means that they can be used in alarms in foreign languages.

Procedure

To integrate texts from text lists in alarms, follow the steps below:

1. Double-click on the "Text lists" command below the PLC in the program navigation.

   The text list editor opens
2. Find the index of the text you want to integrate.
3. Put a placeholder in the format @[Index]%t#[textlist]@ at the point at which you want the text to appear.

Note

[Index] = for example, 1W, where 1W is the first associated value of the alarm of the type WORD.

9.5.9.4 Example of integrating texts from text lists in alarms

Configured alarm text: Pressure has risen @2W%t#textlist1@.

Text list with the name "textlist1":

Index	German	English
1734	zu hoch	too high

The associated value is supplied with the value 1734.

The following alarm text is displayed: Pressure has risen too high.

See also

Integrating texts from text lists in alarms (Page 1197)

9.5.10 Alarm classes

9.5.10.1 Creating alarm classes

You can configure alarm classes to suit your purposes. You can create and edit them in the alarm class editor. An alarm can then by assigned to an alarm class in the alarm editor.

Prerequisites

You have opened the "Common data" folder in project navigation.

Procedure

To configure an alarm class, follow these steps:

1. Double click on the "Alarm classes" entry in project navigation.

   The alarm class editor opens.
2. Select "Insert new alarm class" in the shortcut menu.
3. Enter a unique name for the new alarm class in the "Name" column.

   The language of the name you assign here is neutral.
4. Enter a display name in the "Display name" column. This name is translatable.
5. Select whether or not this alarm class requires acknowledgment in the "With acknowledgment" column.

9.5.10.2 Editing alarm classes

You can change the settings (name, display name, or acknowledgment) for an alarm class at any time even if alarms have already been assigned to the alarm class. The changes are adopted automatically in the alarms.

Copying alarm classes

To copy alarm classes, follow these steps:

1. Select the row with the alarm class you want to copy.
2. Select "Copy" in the shortcut menu.
3. Select "Paste" in the shortcut menu.

Result

The copied alarm class is appended to the end of the table under a new name.

The name of the new alarm class is made up as follows:

<old name><no.>

no.: This the lowest free natural number.

9.6 Using global project functions

9.6.1 Importing and exporting

9.6.1.1 Basics for importing and exporting

Introduction

You can export PLC tag tables to a standardized XLSX format for editing with external table editors. Similarly, you can import PLC tag tables created with external table editors to the TIA Portal.

Overwriting existing PLC tags and constants during import

Existing entries of the same name will be overwritten during import if they have the same name as the entries that will be imported.

Link to existing objects

References to PLC tags or constants that already exist in the project are updated automatically during import. The update is executed based on the name of the PLC tags and constants.

See also

Format of the export file (Page 1200)

Exporting PLC tags (Page 1201)

Importing PLC tags (Page 1202)

9.6.1.2 Format of the export file

Introduction

During the export of PLC tag tables, a standardized XSLX format will be generated that you can edit with external table editors.

This format is also expected during the import of tables.

Format of the export file

The sheet is always named "PLC Tags". This sheet can contain the displayed columns. The sorting order of columns can vary. The sheet does not necessarily have to include all columns. During import, the following values will be identified by a <no value> entry.

The names of the column headers are also clearly defined and are always expected in English.

The following table specifies the content expected for the individual columns:

Element	Explanation
Name	Name of the tags
Path	Group and name of the PLC tag table
Data type	The notation of the data type corresponds to the notation used in the PLC tag table.
Address	The address can be specified with German or international mnemonics.
Comment	Free-form comments
Visible in HMI	The value TRUE or FALSE is expected.
Accessible from HMI	The value TRUE or FALSE is expected.

See also

Basics for importing and exporting (Page 1200)

Exporting PLC tags (Page 1201)

Importing PLC tags (Page 1202)

9.6.1.3 Exporting PLC tags

Requirement

A PLC tag table is open.

Procedure

To export PLC tags and constants, follow these steps:

1. In the PLC tag table, click the "Export" button.

   The "Export to Excel" dialog opens.
2. Select the path to which you want to save the export file.
3. Select whether to export tags and/or constants.
4. Click the "OK" button.

Result

The export file will be generated. Errors and warnings generated during export are indicated in the "Info" tab of the Inspector window.

See also

Basics for importing and exporting (Page 1200)

Format of the export file (Page 1200)

Importing PLC tags (Page 1202)

9.6.1.4 Importing PLC tags

Requirement

A table exists and it conforms to format specifications.

Procedure

To import a PLC tag table, follow these steps:

1. Open the "All tags" table.
2. Click the "Import" button.

   The "Import from Excel" dialog opens.
3. Select whether to import PLC tags and/or constants.
4. Select the table you want to import.
5. Click the "OK" button.

Result

The PLC tag table will be imported.

Errors and warnings generated during export are indicated in the "Info" tab of the Inspector window.

See also

Basics for importing and exporting (Page 1200)

Format of the export file (Page 1200)

Exporting PLC tags (Page 1201)

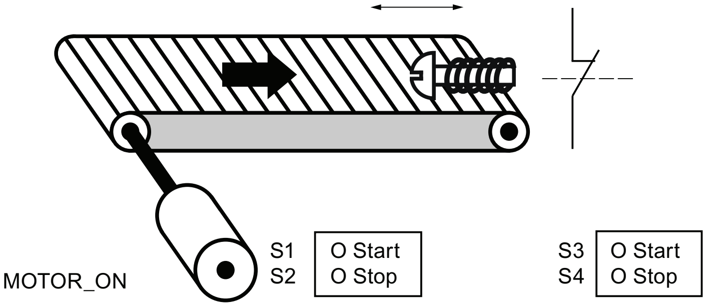
9.7 Programming examples

9.7.1 LAD programming examples

9.7.1.1 Example of controlling a conveyor belt

Controlling a conveyor belt

The following figure shows a conveyor belt that can be activated electrically. There are two push-button switches at the beginning of the belt: S1 for Start and S2 for Stop. There are also two push-button switches at the end of the belt: S3 for Start and S4 for Stop. It is possible to start or stop the belt from either end.



Implementation

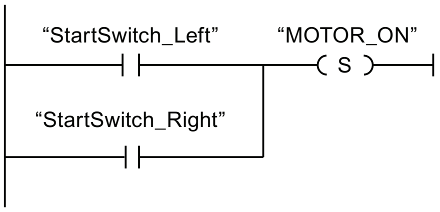
The following table shows the definition of the tags used:

Name	Data type	Comment
Startschalter_Links (S1)	Bool	Start switch on the left side of the conveyor belt
Stoppschalter_Links (S2)	Bool	Stop switch on the left side of the conveyor belt
Startschalter_Rechts (S3)	Bool	Start switch on the right side of the conveyor belt
Stoppschalter_Rechts (S4)	Bool	Stop switch on the right side of the conveyor belt
MOTOR_ON	Bool	Turn on the conveyor belt motor

The following networks show the LAD programming for solving this task:

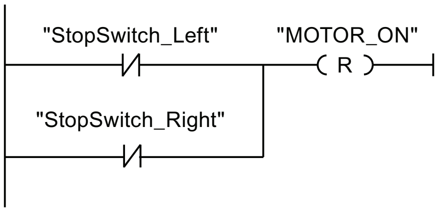
Network 1:

The conveyor belt motor is switched on when Start switch "S1" or "S3" is pressed.



Network 2:

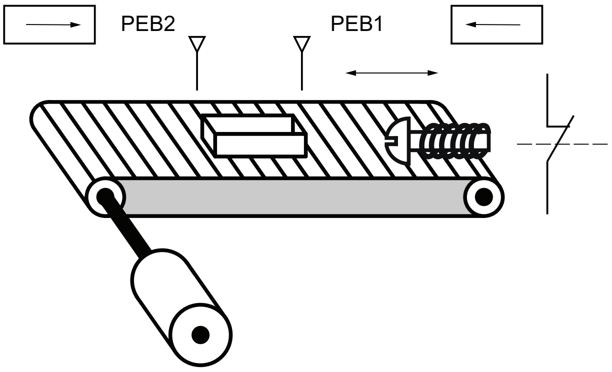
The conveyor belt motor is switched off when Stop switch "S2" or "S4" is pressed.



9.7.1.2 Example of detecting the direction of a conveyor belt

Detecting the direction of a conveyor belt

The following figure shows a conveyor belt that is equipped with two photoelectric barriers (PEB1 and PEB2). These are designed to detect the direction in which a package is moving on the belt.



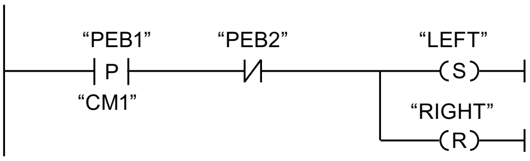
Implementation

The following table shows the definition of the tags used:

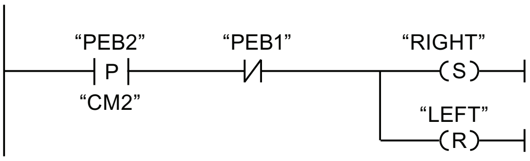
Name	Data type	Comment
PEB1	Bool	Photoelectric barrier 1
PEB2	Bool	Photoelectric barrier 2
RIGHT	Bool	Display during movement to right
LEFT	Bool	Display during movement to left
CM1	Bool	Edge bit memory 1
CM2	Bool	Edge bit memory 2

The following networks show the LAD programming for solving this task:

Network 1: If the signal changes from "0" to "1" (positive edge) at "PEB1" and, at the same time, the signal state at "PEB2" is "0", then the package on the belt is moving to the left.



Network 2: If the signal changes from "0" to "1" (positive edge) at "PEB2" and, at the same time, the signal state at "PEB1" is "0", then the package on the belt is moving to the right.

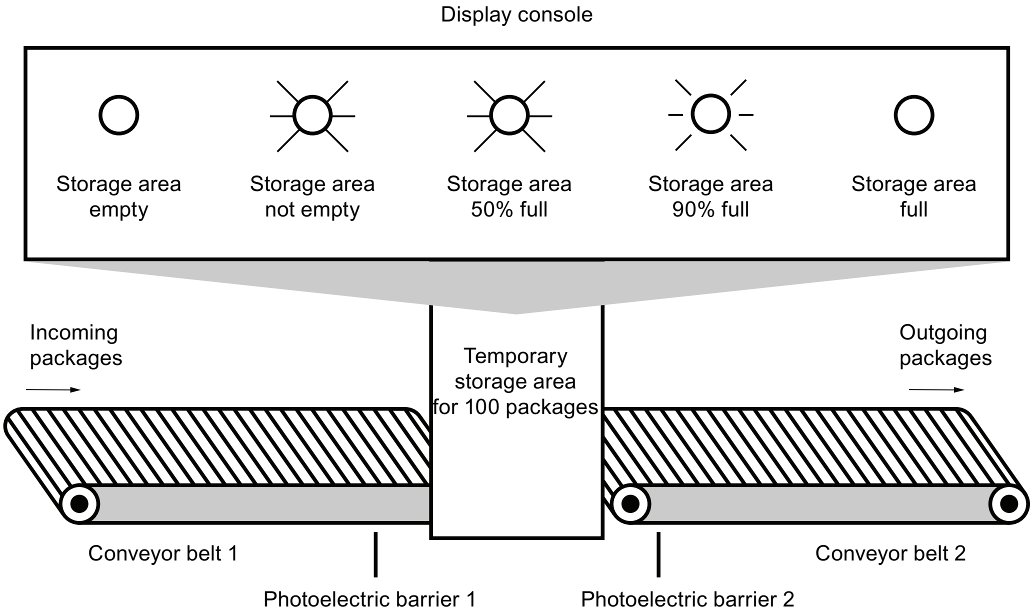


9.7.1.3 Example of detecting the fill level of a storage area

Detecting the fill level of a storage area

The following figure shows a system with two conveyor belts and a temporary storage area between them. Conveyor belt 1 delivers packages to the storage area. A photoelectric barrier at the end of conveyor belt 1 near the storage area detects how many packages are delivered to the storage area. Conveyor belt 2 transports packages from the temporary storage area to a loading dock onto which the packages are loaded for delivery to customers by truck. A photoelectric barrier at the storage area exit detects how many packages leave the storage area to go to the loading dock. A display panel with five lamps indicates the utilization of the temporary storage area.

When a conveyor belt is restarted, the current count value is set to the number of packages available in the storage area.



Implementation

The following table shows the definition of the tags used:

Name	Data type	Comment
PEB1	BOOL	Photoelectric barrier 1
PEB2	BOOL	Photoelectric barrier 2
RESET	BOOL	Reset counter
LOAD	BOOL	Set counter to value of "PV" parameter
STOCK	INT	Stock at restart
PACKAGECOUNT	INT	Number of packages in the storage area (current count value)
STOCK_PACKAGE	BOOL	Is set if the current count value is greater than or equal to the value of the tag "STOCK".
STOR_EMPTY	BOOL	Display lamp: Storage area empty
STOR_NOT_EMPTY	BOOL	Display lamp: Storage area not empty
STOR_50%_FULL	BOOL	Display lamp: Storage area 50 % full
STOR_90%_FULL	BOOL	Display lamp: Storage area 90% full
STOR_FULL	BOOL	Display lamp: Storage area full
VOLUME_50	INT	Comparison value: 50 packages
VOLUME_90	INT	Comparison value: 90 packages
VOLUME_100	INT	Comparison value: 100 packages

The following networks show the LAD programming for activating the lamps:

Network 1:

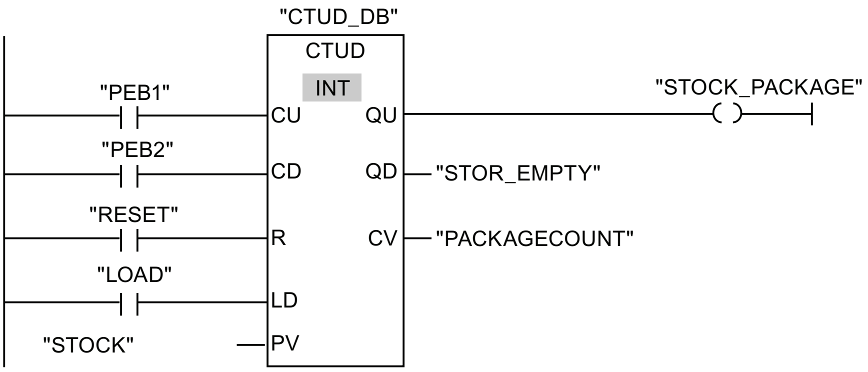
When a package is delivered to the storage area, the signal state at "PEB1" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB1", the "Up" counter is enabled, and the current count value of "PACKAGECOUNT" is increased by one.

When a package is delivered from the storage area to the loading dock, the signal state at "PEB2" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB2", the "Down" counter is enabled, and the current count value of "PACKAGECOUNT" is decreased by one.

If there are no packages in the storage area ("PACKAGECOUNT" = "0"), the "STOR_EMPTY" tag is set to signal state "1", and the "Storage area empty" lamp is switched on.

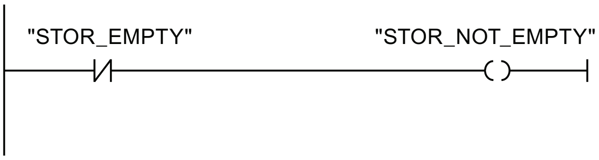
The current count value can be reset to "0" if the "RESET" tag is set to signal state "1".

If the "LOAD" tag is set to signal state "1", the current count value is set to the value of the "STOCK" tag. If the current count value is greater than or equal to the value of the "STOCK" tag , the "STOCK_PACKAGE" tag supplies the signal state "1".



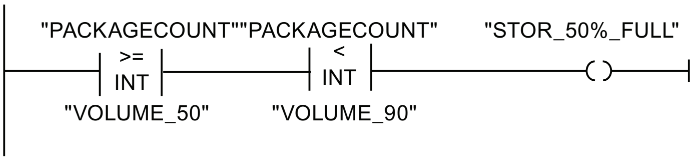
Network 2:

As long as there are packages in the storage area the "STOR_NOT_EMPTY" tag is set to signal state "1", and the "Storage area not empty" lamp is switched on.



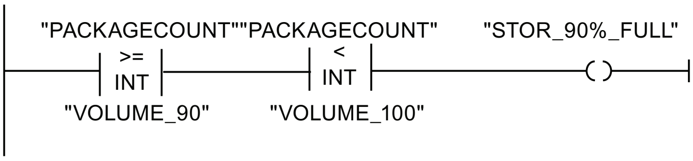
Network 3:

If the number of packages in the storage area is greater than or equal to 50, the "Storage area 50 % full" lamp switches on.



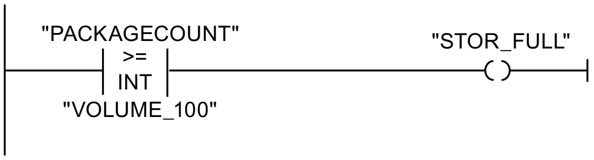
Network 4:

If the number of packages in the storage area is greater than or equal to 90, the "Storage area 90% full" lamp switches on.



Network 5:

If the number of packages in the storage area reaches 100, the "Storage area full" lamp switches on.



9.7.1.4 Example of controlling room temperature

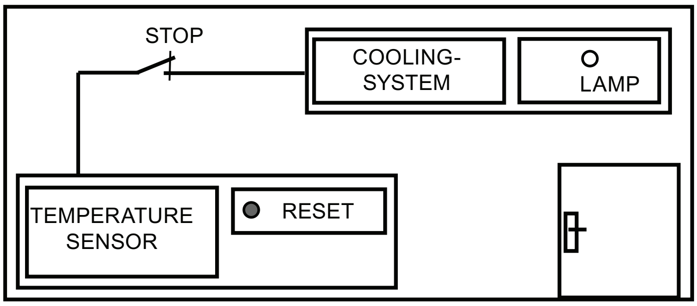
Controlling room temperature

In a cold room, the temperature must be maintained below zero degrees Celsius. Temperature fluctuations are monitored by means of a sensor. If the temperature rises above zero degrees Celsius, the cooling system switches on for a predetermined time. The "Cooling system On" lamp is lit during this time.

The cooling system and the lamp are turned off if one of the following conditions is fulfilled:

- The sensor reports a temperature fall below zero degrees Celsius.
- The preset cooling time has elapsed.
- The pushbutton switch "Stop" has been pressed.

If the preset cooling time has expired, and the temperature in the cold room is still too high, the cooling system can be restarted by means of the pushbutton switch "Reset".



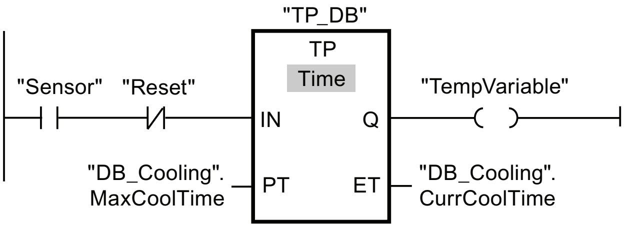
Implementation

The following table shows the definition of the tags used:

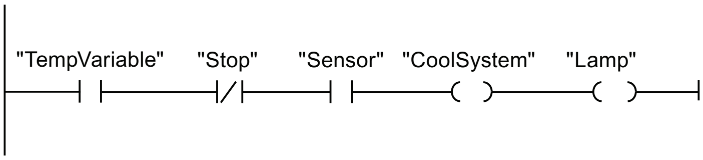
Name	Data type	Comment
Sensor	BOOL	Temperature sensor signal
Reset	BOOL	Restart
Stop	BOOL	The cooling system is switched off.
MaxCoolTime	TIME	Predetermined cooling time This tag is defined in the "DB_Cool" data block.
CurrCoolTime	TIME	Currently elapsed cooling time This tag is defined in the "DB_Cool" data block.
CoolSystem	BOOL	The cooling system is switched on.
Lamp	BOOL	The "Cooling system On" lamp is switched on.
TempVariable	BOOL	Temporary variable This tag stores the signal status of the IEC timer TP.

The following network shows the LAD programming for controlling room temperature:

Network 1:



Network 2:



When the temperature in the cold room rises above zero degrees Celsius, the signal state at the "Sensor" operand switches from "0" to "1" (positive signal edge). In case of a positive signal edge at the input IN, the timer function for the preset cooling time is started and the "TempVariable" receives the signal state "1". The signal state "1" of the "TempVariable" causes the cooling system and the display lamp to be turned on in network 2. The outputs "Sensor", "Cooling system" and "Lamp" must be programmed in network 2, because you can program only one coil at output Q of the timer function.

If the temperature in the cold room falls below zero degrees Celsius, the signal state of the sensor switches back to "0". This switches the cooling system and lamp off.

If the sensor does not signal a temperature drop, the cooling system and lamp are switched off after the predetermined cooling time has elapsed, at the latest. In this case, the cooling process can be restarted by pressing the "Reset" push-button switch. Pressing and releasing the push-button switch generates a new positive signal edge at input IN, which restarts the cooling system.

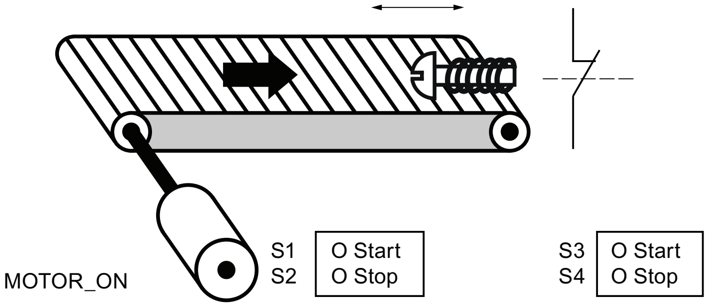
The cooling system and the display lamps can be turned off with the pushbutton switch "Stop" at any time.

9.7.2 FBD programming examples

9.7.2.1 Example of controlling a conveyor belt

Controlling a conveyor belt

The following figure shows a conveyor belt that can be activated electrically. There are two push-button switches at the beginning of the belt: S1 for Start and S2 for Stop. There are also two push-button switches at the end of the belt: S3 for Start and S4 for Stop. It is possible to start or stop the belt from either end.



Implementation

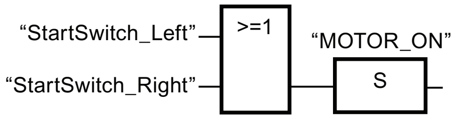
The following table shows the definition of the tags used:

Name	Data type	Comment
Startschalter_Links (S1)	Bool	Start switch on the left side of the conveyor belt
Stoppschalter_Links (S2)	Bool	Stop switch on the left side of the conveyor belt
Startschalter_Rechts (S3)	Bool	Start switch on the right side of the conveyor belt
Stoppschalter_Rechts (S4)	Bool	Stop switch on the right side of the conveyor belt
MOTOR_ON	Bool	Turn on the conveyor belt motor

The following networks show the FBD programming for accomplishing this task:

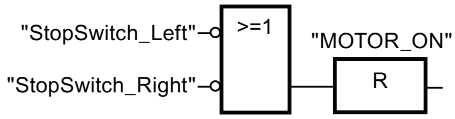
Network 1:

The conveyor belt motor is switched on when Start switch "S1" or "S3" is pressed.



Network 2:

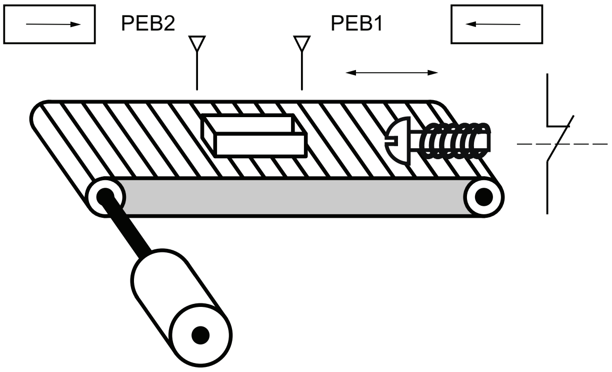
The conveyor belt motor is switched off when Stop switch "S2" or "S4" is pressed.



9.7.2.2 Example of detecting the direction of a conveyor belt

Detecting the direction of a conveyor belt

The following figure shows a conveyor belt that is equipped with two photoelectric barriers (PEB1 and PEB2). These are designed to detect the direction in which a package is moving on the belt.



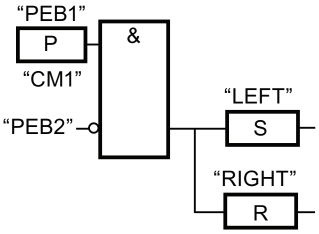
Implementation

The following table shows the definition of the tags used:

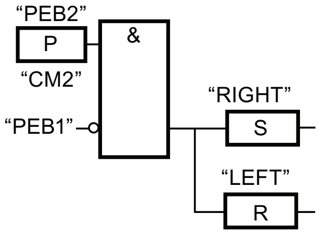
Name	Data type	Comment
PEB1	Bool	Photoelectric barrier 1
PEB2	Bool	Photoelectric barrier 2
RIGHT	Bool	Display during movement to right
LEFT	Bool	Display during movement to left
CM1	Bool	Edge bit memory 1
CM2	Bool	Edge bit memory 2

The following networks show the FBD programming for solving this task:

Network 1: If the signal changes from "0" to "1" (positive edge) at "PEB1" and, at the same time, the signal state at "PEB2" is "0", then the package on the belt is moving to the left.



Network 2: If the signal state changes from "0" to "1" (positive edge) at "PEB2" and, at the same time, the signal state at "PEB1" is "0", then the package on the belt is moving to the right.



9.7.2.3 Example of detecting the fill level of a storage area

Detecting the fill level of a storage area

The following figure shows a system with two conveyor belts and a temporary storage area between them. Conveyor belt 1 delivers packages to the storage area. A photoelectric barrier at the end of conveyor belt 1 near the storage area detects how many packages are delivered to the storage area. Conveyor belt 2 transports packages from the temporary storage area to a loading dock onto which the packages are loaded for delivery to customers by truck. A photoelectric barrier at the storage area exit detects how many packages leave the storage area to go to the loading dock. A display panel with five lamps indicates the utilization of the temporary storage area.

When a conveyor belt is restarted, the current count value is set to the number of packages available in the storage area.

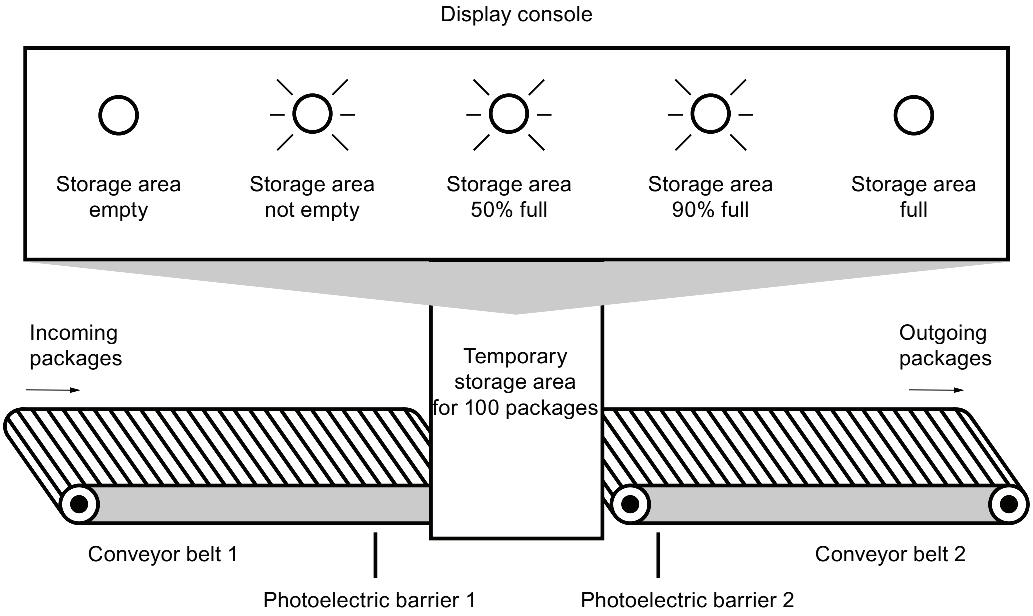


Figure 9-1

Implementation

The following table shows the definition of the tags used:

Name	Data type	Comment
PEB1	BOOL	Photoelectric barrier 1
PEB2	BOOL	Photoelectric barrier 2
RESET	BOOL	Reset counter
LOAD	BOOL	Set counter to value of "CV" parameter
STOCK	INT	Stock at restart
PACKAGECOUNT	INT	Number of packages in the storage area (current count value)
STOCK_PACKAGE	BOOL	Is set if the current count value is greater than or equal to the value of the tag "STOCK".
STOR_EMPTY	BOOL	Display lamp: Storage area empty
STOR_NOT_EMPTY	BOOL	Display lamp: Storage area not empty
STOR_50%_FULL	BOOL	Display lamp: Storage area 50 % full
STOR_90%_FULL	BOOL	Display lamp: Storage area 90% full
STOR_FULL	BOOL	Display lamp: Storage area full
VOLUME_50	INT	Comparison value: 50 packages
VOLUME_90	INT	Comparison value: 90 packages
VOLUME_100	INT	Comparison value: 100 packages

The following networks show the FBD programming for activating the lamps:

Network 1:

When a package is delivered to the storage area, the signal state at "PEB1" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB1", the "Up" counter is enabled, and the current count value of "PACKAGECOUNT" is increased by one.

When a package is delivered from the storage area to the loading dock, the signal state at "PEB2" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB2", the "Down" counter is enabled, and the current count value of "PACKAGECOUNT" is decreased by one.

If there are no packages in the storage area ("PACKAGECOUNT" = "0"), the "STOR_EMPTY" tag is set to signal state "1", and the "Storage area empty" lamp is switched on.

The current count value can be reset to "0" if the "RESET" tag is set to signal state "1".

If the "LOAD" tag is set to signal state "1", the current count value is set to the value of the "STOCK" tag. If the current count value is greater than or equal to the value of the "STOCK" tag , the "STOCK_PACKAGE" tag supplies the signal state "1".

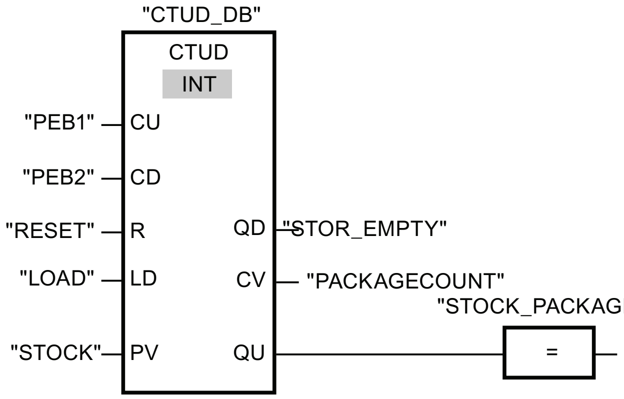

Figure 9-2

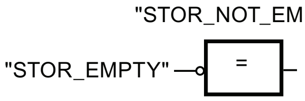
Network 2:

As long as there are packages in the storage area the "STOR_NOT_EMPTY" tag is set to signal state "1", and the "Storage area not empty" lamp is switched on.



Network 3:

If the number of packages in the storage area is greater than or equal to 50, the "Storage area 50 % full" lamp switches on.

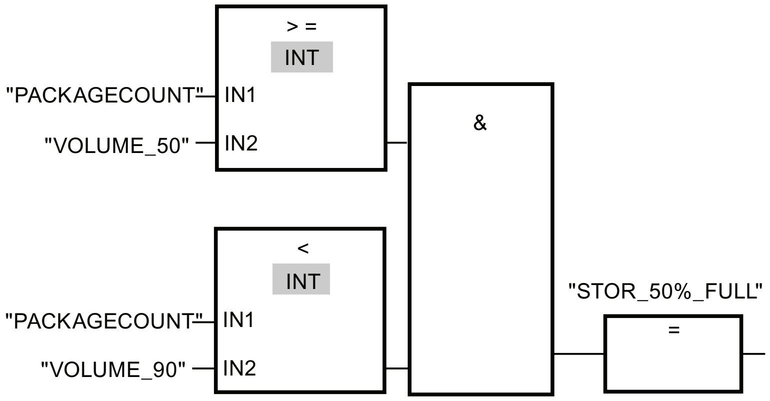


Figure 9-3

Network 4:

If the number of packages in the storage area is greater than or equal to 90, the "Storage area 90% full" lamp switches on.

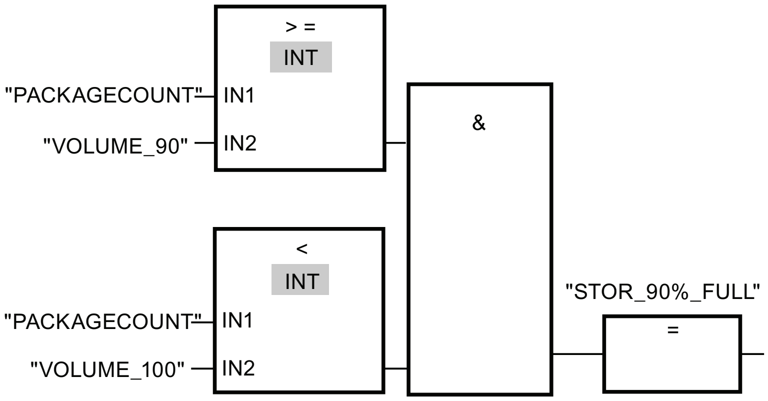

Figure 9-4

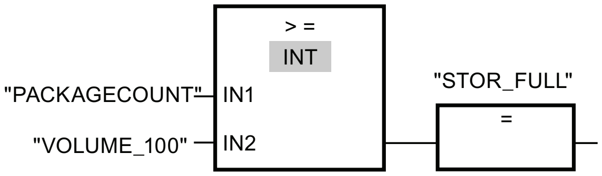
Network 5:

If the number of packages in the storage area reaches 100, the "Storage area full" lamp switches on.



9.7.2.4 Example of controlling room temperature

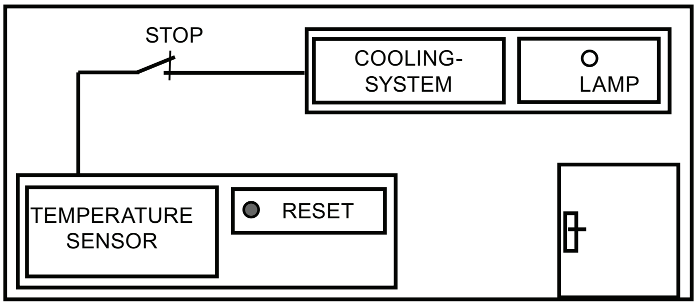
Controlling room temperature

In a cold room, the temperature must be maintained below zero degrees Celsius. Temperature fluctuations are monitored by means of a sensor. If the temperature rises above zero degrees Celsius, the cooling system switches on for a predetermined time. The "Cooling system On" lamp is lit during this time.

The cooling system and the lamp are turned off if one of the following conditions is fulfilled:

- The sensor reports a temperature fall below zero degrees Celsius.
- The preset cooling time has elapsed.
- The pushbutton switch "Stop" has been pressed.

If the preset cooling time has expired, and the temperature in the cold room is still too high, the cooling system can be restarted by means of the pushbutton switch "Reset".



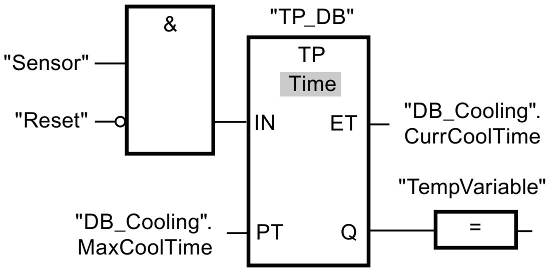
Implementation

The following table shows the definition of the tags used:

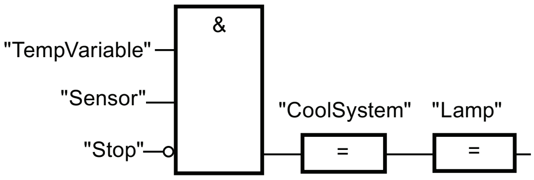
Name	Data type	Comment
Sensor	BOOL	Temperature sensor signal
Reset	BOOL	Restart
Stop	BOOL	The cooling system is switched off.
MaxCoolTime	TIME	Predetermined cooling time This tag is defined in the "DB_Cool" data block.
CurrCoolTime	TIME	Currently elapsed cooling time This tag is defined in the "DB_Cool" data block.
CoolSystem	BOOL	The cooling system is switched on.
Lamp	BOOL	The "Cooling system On" lamp is switched on.
TempVariable	BOOL	Temporary variable This tag stores the signal status of the IEC timer TP.

The following network shows the FBD programming for controlling room temperature:

Network 1:



Network 2:



When the temperature in the cold room rises above zero degrees Celsius, the signal state at the "Sensor" operand switches from "0" to "1" (positive signal edge). In case of a positive signal edge at the input IN, the timer function for the preset cooling time is started and the "TempVariable" receives the signal state "1". The signal state "1" of the "TempVariable" causes in network 2 that the cooling system as well as the display lamp are turned on. The outputs "Sensor", "Cooling system" and "Lamp" must be programmed in network 2, because you can program only one coil at output Q of the timer function.

If the temperature in the cold room falls below zero degrees Celsius, the signal state of the sensor switches back to "0". This switches the cooling system and lamp off.

If the sensor does not signal a temperature drop, the cooling system and lamp are switched off after the predetermined cooling time has elapsed, at the latest. In this case, the cooling process can be restarted by pressing the "Reset" push-button switch. Pressing and releasing the push-button switch generates a new positive signal edge at input IN, which restarts the cooling system.

The cooling system and the display lamps can be turned off with the pushbutton switch "Stop" at any time.

9.8 References

9.8.1 General parameters of the instructions

9.8.1.1 Meaning of the parameters REQ, RET_VAL and BUSY with asynchronous instructions

Asynchronous instructions

For instructions that work asynchronously, the function is executed with several calls.

Identification of the job

If you use asynchronous instructions to trigger a process interrupt, output control commands to DP slaves, start a data transfer, or abort a non-configured connection with one of the SFCs listed above and then call the same SFC again before the current job is completed, then the reaction of the SFC will depend on whether the second call involves the same job.

Parameter REQ

The input parameter REQ (request) is used solely to start the job:

- If you call the instruction for a job that is not currently active, the job is started with REQ = 1 (case 1).
- If a particular job has been started and not yet completed and you call the instruction again to perform the same job (for example, in a cyclic interrupt OB), then REQ is not evaluated by the instruction (case 2).

Parameter RET_VAL and BUSY

The output parameters RET_VAL and BUSY indicate the status of the job.

Pay attention to the note in section: Evaluating errors with output parameter RET_VAL (Page 1222)

- In case 1 (first call with REQ=1), the input parameter will be entered in RET_VALW#16#7001 if system resources are available and supply is correct. BUSY will be set.

  If the required system resources are currently being used or the input parameters have errors, the corresponding error code is entered in RET_VAL and BUSY has the value 0.
- In case 2 (interim call) W#16#7002 will be entered in RET_VAL (this corresponds to a warning: Job still being processed!), and BUSY will be set.
- The following applies to the last call for a job:
  - For instruction "DPNRM_DG (Page 1725)", the number of data in bytes will entered as integer in RET_VAL in case there are no errors in data transmission. BUSY has the value "0" in this case.

    If there is an error, then the error information will be entered in RET_VAL and you should not evaluate BUSY in this case.
  - For all other instructions, "0" will be entered in RET_VAL if the job was executed without errors and BUSY has the value "0" in this case. If there is an error, the error code is entered in RET_VAL and BUSY has the value "0" in this case.

Note

If the first and last call coincide, the reaction is the same for RET_VAL and BUSY as described for the last call.

Overview

The following table provides you with an overview of the relationships explained above. In particular, it shows the possible values of the output parameters if the execution of the job is not completed after an instruction call has been completed.

Note

Following every call, you must evaluate the relevant output parameters in your program.

Relationship between call, REQ, RET_VAL and BUSY during execution of a "running" job.

Number of the call	Type of call	REQ	RET_VAL	BUSY
1	First call	1	W#16#7001	1
			Error code	0
2 to (n - 1)	Intermediate call	irrelevant	W#16#7002	1

Number of the call	Type of call	REQ	RET_VAL	BUSY
n	Last call	irrelevant	W#16#0000, if no errors have occurred.	0
			Error code if errors occurred	0

9.8.1.2 Evaluating errors with output parameter RET_VAL

Types of error information

An executed instruction indicates in the user program whether or not the CPU was able to execute the function of the instruction successfully.

You can obtain information about any errors that occurred in two ways:

- In the BR bit of the status word
- in the output parameter RET_VAL (return value).

Note

Before evaluating the output parameters specific to an instruction, you should always follow the steps below:

- First, evaluate the BR bit of the status word.
- Then check the output parameter RET_VAL.

If the BR bit indicates that an error has occurred or if RET_VAL contains a general error code, you should not evaluate the instruction-specific output parameters.

Error information in the return value

An instruction indicates that an error occurred during its execution by entering the value "0" in the binary result bit (BR) of the status word. Some instructions provide an additional error code at an output parameter known as the return value (RET_VAL). If a general error is entered in the output parameter RET_VAL (see below for explanation), this is only indicated by the value "0" in the BR bit of the status word.

The return value is of the data type integer (INT). The relationship of the return value to the value "0" indicates whether or not an error occurred during execution of the function.

CPU execution of the instruction	BR	Return value	Sign of the integer
With error(s)	0	less than "0"	negative (sign bit is "1")
Without error	1	greater than or equal to "0"	positive (sign bit is "0")

Reacting to error information

There are two types of error codes in RET_VAL:

- A general error code that all instructions can output and
- A specific error code that an instruction can output and which relates to its specific function.

You can write your program so that it reacts to the errors that occur during execution of an instruction. This way you prevent further errors occurring as a result of the first error.

General and specific error information

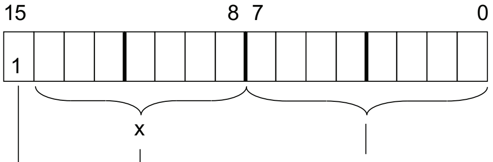
The return value (RET_VAL) of an instruction provides one of the two following types of error codes:

- A general error code that relates to errors that can occur in any instruction.
- A specific error code that relates only to the particular instruction.

Even though the data type of the output parameter RET_VAL is an integer (INT), the error codes for the instruction are grouped according to hexadecimal values. If you want to examine a return value and compare the value with the error codes listed in this documentation, then display the error code in hexadecimal format.

The figure below shows the structure of a system function error code in hexadecimal format.

Error code, e.g. W#16#8081



Event number or error class and single error

If x = ‘0‘, then you are dealing with a specific error code of an instruction. The specific error code is included in the description of the individual instruction.

If x > = ‘0‘, then you are dealing with a general error code of an instruction. In this case x is the number of the instruction parameter that has caused the error. The possible general error codes are listed in the following table.

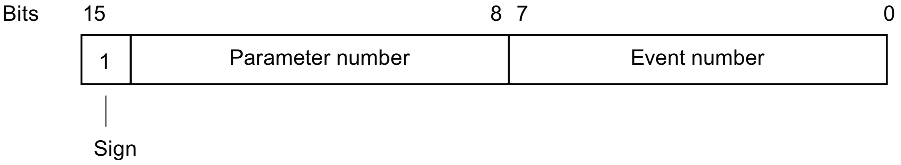
Sign bit = 1 indicates that an error has occurred.

General error information

The general error code indicates errors that can occur in all instructions. A general error code consists of the following two numbers:

- A parameter number from 1 to 111, where 1 indicates the first parameter of the called instruction, 2 the second parameter, and so forth.
- An event number from 0 to 127. The event number indicates that a synchronous error occurred.

The following table lists the codes for general errors and an explanation of each error.



Note

If a general error code was entered in RET_VAL, then the following situations are possible:

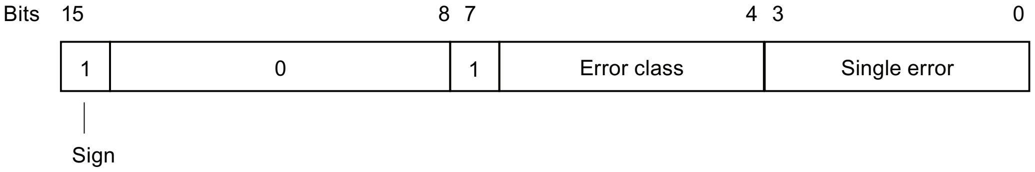
- The action associated with the instruction may have been started or already completed.
- A specific instruction error may have occurred when the action was performed. As a result of a general error that occurred later, the specific error could, however, no longer be indicated.

Specific error information

Some instructions have a return value that provides an error code specific for the instruction. A specific error code indicates errors that can occur only in specific instructions.

A specific error code consists of the following two numbers:

- An error class from 0 to 7.
- An error number from 0 to 15.



General error codes

The following table explains the general error codes of a return value. The error code is shown in hexadecimal format. The letter x in each code number is simply a place holder and represents the number of the system function parameter that caused the error.

General error codes

Error code (W#16#...)	Explanation
8x7F	Internal error This error code indicates an internal error at parameter x.
8x01	Illegal syntax ID at an VARIANT parameter
8x22	Range length error when reading a parameter.
8x23	Range length error when writing a parameter. This error code indicates that the parameter x is located either entirely or partly outside the range of an address, or that the length of a bit range is not a multiple of 8 with an VARIANT parameter.
8x24	Range error when reading a parameter.
8x25	Range error when writing a parameter. This error code indicates that the parameter x is located in a range that is illegal for the system function. Refer to the descriptions of the individual functions for information about the illegal ranges.
8x26	The parameter contains a timer cell number that is too high. This error code indicates that the timer cell specified in parameter x does not exist.
8x27	The parameter contains a counter cell number that is too high (counter number error). This error code indicates that the counter cell specified in parameter x does not exist.
8x28	Alignment error when reading a parameter.
8x29	Alignment error when writing a parameter. This error code indicates that the reference to parameter x is an operand with bit address that is not equal to 0.
8x30	The parameter is located in a read-only global DB.
8x31	The parameter is located in a read-only instance DB. This error code indicates that parameter x is located in a read-only data block. If the data block was opened by the system function itself, the system function always returns the value W#16#8x30.
8x32	The parameter contains a DB number that is too high (DB number error).
8x34	The parameter contains an FC number that is too high (FC number error).
8x35	The parameter contains an FB number that is too high (FB number error). This error code indicates that parameter x contains a block number higher than the highest permitted number.
8x3A	The parameter contains the number of a DB that is not loaded.
8x3C	The parameter contains the number of an FC that is not loaded.
8x3E	The parameter contains the number of an FB that is not loaded.
8x42	An access error occurred while the system was attempting to read a parameter from the peripheral input area.

Error code (W#16#...)	Explanation
8x43	An access error occurred while the system was attempting to write a parameter to the peripheral output area.
8x44	Error in the nth (n > 1) read access after an error occurred.
8x45	Error in the nth (n > 1) write access after an error occurred. This error code indicates that access to the required parameter is denied.

9.8.2 Basic instructions

9.8.2.1 LAD

Bit logic operations

---| |---: Normally open contact

Description

The activation of the normally open contact depends on the signal state of the associated operand. If the signal state of the operand is "1", the normally open contact is closed and the signal state at the output of the instruction is set to "1".

If the signal state of the operand is "0", the normally open contact is not activated and the signal state at the output of the instruction is set to "0".

Two or more normally open contacts are linked bit-by-bit by AND when connected in series. With a series connection, power flows when all contacts are closed.

The normally open contacts are linked by OR when connected in parallel. With a parallel connection, power flows when one of the contacts is closed.

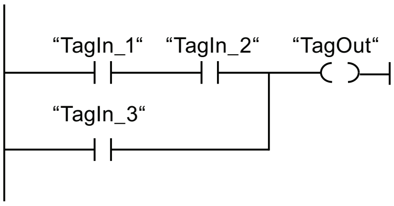
Parameters

The following table shows the parameters of the instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, D, L	Operand whose signal state is queried.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- The operands "TagIn_1" and "TagIn_2" have the signal state "1".
- The operand "TagIn_3" has the signal state "1".

Example of controlling room temperature (Page 1209)

---| / |---: Normally closed contact

Description

The activation of the normally closed contact depends on the signal state of the associated operand. If the signal state of the operand is "1", the normally closed contact is opened and the signal state at the output of the instruction is set to "0".

If the signal state of the operand is "0", the normally closed contact is not activated and the signal state at the output of the instruction is set to "1".

Two or more normally closed contacts are linked bit-by-bit by AND when connected in series. With a series connection, power flows when all contacts are closed.

The normally closed contacts are linked by OR when connected in parallel. With a parallel connection, power flows when one of the contacts is closed.

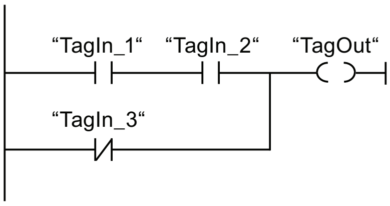
Parameters

The following table shows the parameters of the instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, D, L	Operand whose signal state is queried.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- The operands "TagIn_1" and "TagIn_2" have the signal state "1".
- The operand "TagIn_3" has the signal state "0".

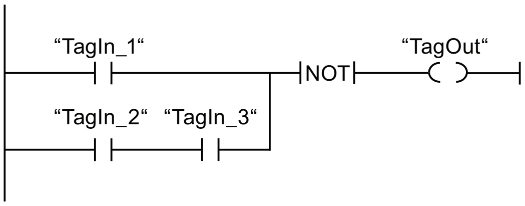
--|NOT|--: Invert RLO

Description

You can use the "Invert RLO" instruction to invert the signal state of the result of logic operation (RLO). If the signal state is "1" at the input of the instruction, the output of the instruction has signal state "0". If the signal state is "0" at the input of the instruction, the output has the signal state "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is reset when one of the following conditions is fulfilled:

- The operand "TagIn_1" has the signal state "1".
- The signal state of the operands "TagIn_2" and "TagIn_3" is "1".

---( )---: Assignment

Description

You can use the "Assignment" instruction to set the bit of a specified operand. If the result of logic operation (RLO) at the input of the coil has signal state "1", the specified operand is set to signal state "1". If the signal state is "0" at the input of the coil, the bit of the specified operand is reset to "0".

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output.

The "Assignment" instruction can be placed at any position in the network.

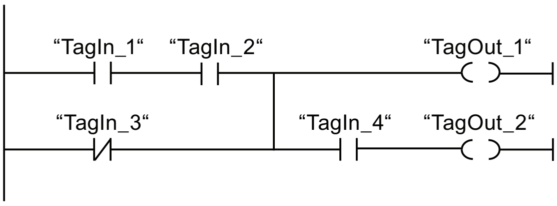
Parameter

The following table shows the parameters of the "Assignment" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand to which the RLO is assigned.

Example

The following example shows how the instruction works:



The "TagOut_1" operand is set when one of the following conditions is fulfilled:

- The operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of the operand "TagIn_3" is "0".

The "TagOut_2" operand is set when one of the following conditions is fulfilled:

- Operands "TagIn_1", "TagIn_2", and "TagIn_4" have signal state "1".
- The signal state of the "TagIn_3" operand is "0" and the signal state of the "TagIn_4" operand is "1".

--(/)--: Negate assignment

Description

The "Negate assignment" instruction inverts the result of logic operation (RLO) and assigns it to the specified operand. When the RLO at the input of the coil is "1", the operand is reset. When the RLO at the input of the coil is "0", the operand is set to signal state "1".

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

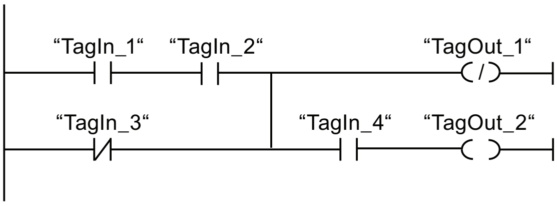
Parameters

The following table shows the parameters of the "Negate assignment" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand to which the RLO is assigned.

Example

The following example shows how the instruction works:



Operand "TagOut_1" is reset when one of the following conditions is fulfilled:

- The operands "TagIn_1" and "TagIn_2" have the signal state "1".
- The signal state of the operand "TagIn_3" is "0".

See also

Overview of the valid data types (Page 741)

---(R)---: Reset output

Description

You can use the "Reset output" instruction to reset the signal state of a specified operand to "0".

The instruction is only executed if the result of logic operation (RLO) at the input of the coil is "1". If power flows to the coil (RLO = "1"), the specified operand is reset to "0". If the RLO at the input of the coil is "0" (no signal flow to the coil), the signal state of the specified operand remains unchanged.

Executing the instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

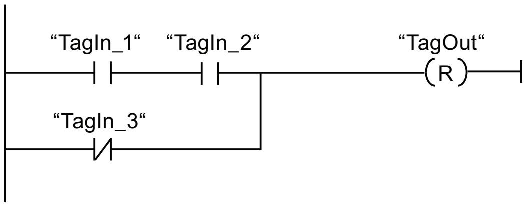
Parameter

The following table shows the parameters of the "Reset output" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand which is reset with RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is reset when one of the following conditions is fulfilled:

- The operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of the operand "TagIn_3" is "0".

See also

Overview of the valid data types (Page 741)

Example of controlling a conveyor belt (Page 1203)

Example of detecting the direction of a conveyor belt (Page 1204)

---(S)---: Set output

Description

You can use the "Set output" instruction to set the signal state of a specified operand to "1".

The instruction is only executed if the result of logic operation (RLO) at the input of the coil is "1". If power flows to the coil (RLO = "1"), the specified operand is set to "1". If the RLO at the input of the coil is "0" (no signal flow to the coil), the signal state of the specified operand remains unchanged.

Executing the instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

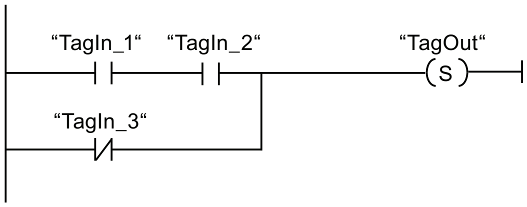
Parameter

The following table shows the parameters of the "Set output" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand which is set with RLO = "1".

Example

The following example shows how the instruction works:



The "TagOut" operand is set when one of the following conditions is fulfilled:

- The operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of the operand "TagIn_3" is "0".

Example of detecting the direction of a conveyor belt (Page 1204)

SET_BF: Set bit field

Description

You use the "Set bit field" instruction to set several bits starting from a certain address.

You determine the number of bits to be set using the value of <Operand1>. The address of the first bit to be set is defined by <Operand2>. If the value of <Operand1> is greater than the number of bits in a selected byte, then the bits of the next byte will be set. The bits remain set until they are explicitly reset, for example, by another instruction.

The instruction is only executed if the result of logic operation (RLO) at the input of the coil is "1". If the RLO at the input of the coil is "0", the instruction does not execute.

The "Set bit field" instruction can also be placed without preceding logic operation at the start or end of the current path.

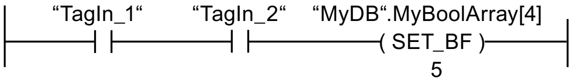
Parameter

The following table shows the parameters of the "Set bit field" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand1>	Input	UINT	Constant	Number of bits to be set
<Operand2>	Output	BOOL	I, Q, M With a DB or an IDB, an element of a array [..] of BOOL	Pointer to the first bit to be set.

Example

The following example shows the mode of operation of the "Set bit field" instruction:



If the operands "TagIn_1" and "TagIn_2" have the signal state "1", 5 bits are set starting at the address of the operand "MyDB".MyBoolArray[4].

See also

Overview of the valid data types (Page 741)

RESET_BF: Reset bit field

Description

You use the "Reset bit field" instruction to re set several bits starting from a certain address.

You specify the number of bits to be reset using the value of <Operand1>. The address of the first bit to be reset is specified by <Operand2>. If the value of <Operand1> is greater than the number of bits in a selected byte, the bits of the next byte will be reset. The bits remain set until they are explicitly reset, for example, by another instruction.

The instruction is only executed if the result of logic operation (RLO) at the input of the coil is "1". If the RLO at the input of the coil is "0", the instruction does not execute.

The "Reset bit field" instruction can also be placed without preceding logic operation at the start or end of the current path.

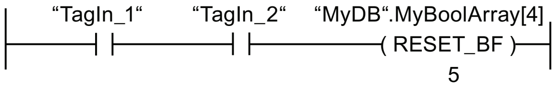
Parameters

The following table shows the parameters of the "Reset bit field" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Input	UINT	Constant	Number of bits to be reset
<Operand2>	Output	BOOL	I, Q, M With a DB or an IDB, an element of a array [..] of BOOL	Pointer to the first bit to be reset.

Example

The following example shows the mode of operation of the "Reset bit field" instruction:



If the operands "TagIn_1" and "TagIn_2" have the signal state "1", 5 bits are reset starting at the address of the operand "MyDB".MyBoolArray[4].

See also

Overview of the valid data types (Page 741)

SR: Set/reset flip-flop

Description

You can use the "Set/reset flip-flop" instruction to set or reset the bit of a specified operand based on the signal state of the inputs S and R1. If the signal state is "1" at input S and "0" at input R1, the specified operand is set to "1". If the signal state is "0" at input S and "1" at input R1, the specified operand will be reset to "0".

Input R1 takes priority over input S. When the signal state is "1" at both inputs S and R1, the signal state of the specified operand is reset to "0".

The instruction is not executed if the signal state at the two inputs S and R1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

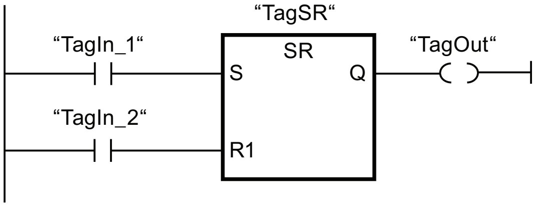
Parameter

The following table shows the parameters of the "Set/reset flip-flop" instruction:

Parameter	Declaration	Data type	Memory area	Description
S	Input	BOOL	I, Q, M, D, L	Enable setting
R1	Input	BOOL	I, Q, M, D, L	Enable resetting
<Operand>	Output	BOOL	I, Q, M, D, L	Operand that is set or reset
Q	Output	BOOL	I, Q, M, D, L	Signal state of the operand

Example

The following example shows how the "Set/reset flip-flop" instruction works:



The operands "TagSR" and "TagOut" are set when the following conditions are fulfilled:

- The operand "TagIn_1" has the signal state "1".
- The operand "TagIn_2" has the signal state "0".

The operands "TagSR" and "TagOut" are reset when one of the following conditions is fulfilled:

- The operand "TagIn_1" has signal state "0" and the operand "TagIn_2" has signal state "1".
- The operands "TagIn_1" and "TagIn_2" have signal state "1".

See also

Overview of the valid data types (Page 741)

RS: Reset/set flip-flop

Description

You can use the "Reset/set flip-flop" instruction to reset or set the bit of a specified operand based on the signal state of the inputs R and S1. If the signal state is "1" at input R and "0" at input S1, the specified operand will be reset to "0". If the signal state is "0" at input R and "1" at input S1, the specified operand is set to "1".

Input S1 takes priority over input R. When the signal state is "1" at both inputs R and S1, the signal state of the specified operand is set to "1".

The instruction is not executed if the signal state at the two inputs R and S1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

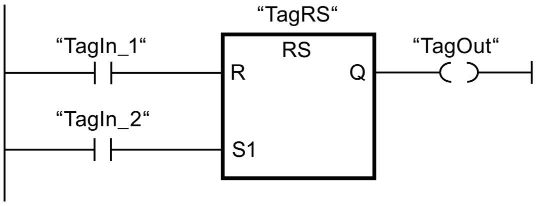
Parameter

The following table shows the parameters of the "Reset/set flip-flop" instruction:

Parameter	Declaration	Data type	Memory area	Description
R	Input	BOOL	I, Q, M, D, L	Enable resetting
S1	Input	BOOL	I, Q, M, D, L	Enable setting
<Operand>	Output	BOOL	I, Q, M, D, L	Operand that is reset or set
Q	Output	BOOL	I, Q, M, D, L	Signal state of the operand

Example

The following example shows how the "Reset/set flip-flop" instruction works:



The operands "TagRS" and "TagOut" are reset when the following conditions are fulfilled:

- The operand "TagIn_1" has the signal state "1".
- The operand "TagIn_2" has the signal state "0".

The operands "TagRS" and "TagOut" are set when one of the following conditions is fulfilled:

- The operand "TagIn_1" has signal state "0" and the operand "TagIn_2" has signal state "1".
- The operands "TagIn_1" and "TagIn_2" have signal state "1".

--|P|--: Scan operand for positive signal edge

Description

You can use the "Scan operand for positive signal edge" instruction to determine whether there is a "0" to "1" change in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous scan stored in an edge memory bit (<operand2>). If the instruction detects a change in the result of logic operation from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

You specify the operand to be queried (<Operand1>) in the operand placeholder above the instruction. You specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit must be located in a DB (static area for FB) or in the bit memory area.

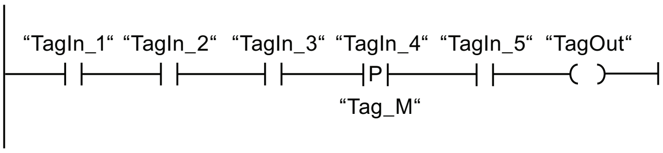
Parameter

The following table shows the parameters of the "Scan operand for positive signal edge" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand1>	Input	BOOL	I, Q, M, D, L	Signal to be scanned
<Operand2>	InOut	BOOL	I, Q, M, D, L	Edge memory bit in which the signal state of the previous scan is saved

Example

The following example shows how the "Scan operand for positive signal edge" instruction works:



Operand "TagOut" is set when the following conditions are fulfilled:

- Operands "TagIn_1", "TagIn_2", and "TagIn_3" have signal state "1".
- There is a rising edge at operand "TagIn_4". The signal state of the previous scan is stored in the edge memory bit "Tag_M".
- The signal state of the operand "TagIn_5" is "1".

Overview of the valid data types (Page 741)

Example of detecting the direction of a conveyor belt (Page 1204)

--|N|--: Scan operand for negative signal edge

Description

You can use the "Scan operand for negative signal edge" instruction to detect whether there is a change from "1" to "0" in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous scan that is saved in an edge memory bit <Operand2>. If the instruction detects a change in the result of logic operation from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

You specify the operand to be queried (<Operand1>) in the operand placeholder above the instruction. You specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit must be located in a DB (static area for FB) or in the bit memory area.

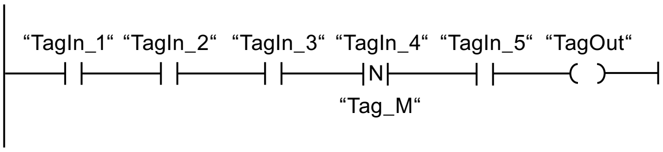
Parameter

The following table shows the parameters of the "Scan operand for negative signal edge" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand1>	Input	BOOL	I, Q, M, D, L	Signal to be scanned
<Operand2>	InOut	BOOL	I, Q, M, D, L	Edge memory bit in which the signal state of the previous scan is saved

Example

The following example shows how the "Scan operand for negative signal edge" instruction works:



Operand "TagOut" is set when the following conditions are fulfilled:

- Operands "TagIn_1", "TagIn_2", and "TagIn_3" have signal state "1".
- There is a falling edge at operand "TagIn_4". The signal state of the previous scan is stored in the edge memory bit "Tag_M".
- The signal state of the operand "TagIn_5" is "1".

Overview of the valid data types (Page 741)

--(P)--: Set operand on positive signal edge

Description

You can use the "Set operand on positive signal edge" instruction to set a specified operand (<Operand1>) when there is a "0" to "1" transition in the power flow. The instruction compares the current result of logic operation (RLO) with the result of logic operation from the previous query, which is saved in an edge memory bit (<Operand2>). If the instruction detects a change in the power flow from "0" to "1", there is a positive, rising edge.

When there is a positive edge, <Operand1> is set to signal state "1" for one program cycle. In all other cases, the operand has the signal state "0".

Specify the operand to be set (<Operand1>) in the operand placeholder above the instruction. Specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit is overwritten. This step influences the edge evaluation and the result is therefore no longer unique. The memory area of the edge memory bit has to lie in a DB (static area for FB) or in the bit memory area.

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

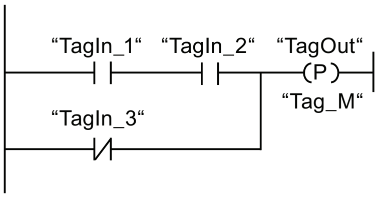
Parameters

The following table shows the parameters of the "Set operand on positive signal edge" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Output	BOOL	I, Q, M, D, L	Operand which is set by a positive edge.
<Operand2>	InOut	BOOL	I, Q, M, D	Edge memory bit

Example

The following example shows how the instruction works:



Operand "TagOut" is set for one program cycle, when the signal state at the input of the coil switches from "0" to "1" (positive edge). In all other cases, the operand "TagOut" has the signal state "0".

See also

Overview of the valid data types (Page 741)

--(N)--: Set operand on negative signal edge

Description

You can use the "Set operand on negative signal edge" instruction to set a specified operand (<Operand1>) when a "1" to "0" change is detected in the power flow. The instruction compares the current result of logic operation (RLO) with the result of logic operation from the previous query, which is saved in an edge memory bit (<Operand2>). If the instruction detects a change in the power flow from "1" to "0", there is a negative, falling edge.

When a negative edge is detected, <Operand1> is set to signal state "1" for one program cycle. In all other cases, the operand has the signal state "0".

Specify the operand to be set (<Operand1>) in the operand placeholder above the instruction. Specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit is overwritten. This step influences the edge evaluation and the result is therefore no longer unique. The memory area of the edge memory bit has to lie in a DB (static area for FB) or in the bit memory area.

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

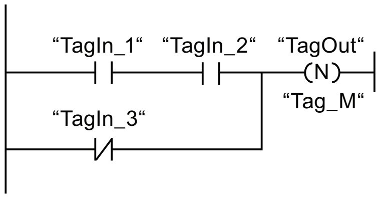
Parameters

The following table shows the parameters of the "Set operand on negative signal edge" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Output	BOOL	I, Q, M, D, L	Operand which is set by a negative edge.
<Operand2>	InOut	BOOL	I, Q, M, D	Edge memory bit

Example

The following example shows how the instruction works:



Operand "TagOut" is set for one program cycle, when the signal state at the input of the coil switches from "1" to "0" (negative edge). In all other cases, the operand "TagOut" has the signal state "0".

Overview of the valid data types (Page 741)

P_TRIG: Scan RLO for positive signal edge

Description

Use the "Scan RLO for positive signal edge" instruction to query a "0" to "1" change in the signal state of the result of logic operation (RLO). The instruction compares the current signal state of the result of logic operation (RLO) with the signal state of the previous query, which is saved in an edge memory bit (<Operand>). If the instruction detects a change in the RLO from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit is overwritten. This step influences the edge evaluation and the result is therefore no longer unique. The memory area of the edge memory bit must be located in a DB (static area with an FB) or in the bit memory area.

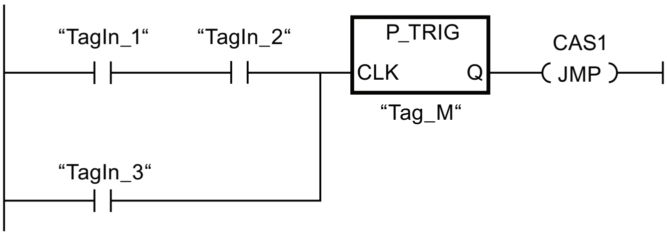
Parameters

The following table shows the parameters of the "Scan RLO for positive signal edge" instruction:

Parameters	Declaration	Data type	Memory area	Description
CLK	Input	BOOL	I, Q, M, D, L	Current RLO
<Operand>	InOut	BOOL	I, Q, M, D, L	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	I, Q, M, D, L	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO of the previous query is saved in the edge memory bit "Tag_M". If a "0" to "1" change is detected in the signal state of the RLO, the program jumps to jump label CAS1.

See also

Overview of the valid data types (Page 741)

N_TRIG: Scan RLO for negative signal edge

Description

Use the "Scan RLO for negative signal edge" instruction to query a "1" to "0" change in the signal state of the result of logic operation (RLO). The instruction compares the current signal state of the result of logic operation with the signal state of the previous query, which is saved in an edge memory bit (<Operand>). If the instruction detects a change in the RLO from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit is overwritten. This step influences the edge evaluation and the result is therefore no longer unique. The memory area of the edge memory bit must be located in a DB (static area with an FB) or in the bit memory area.

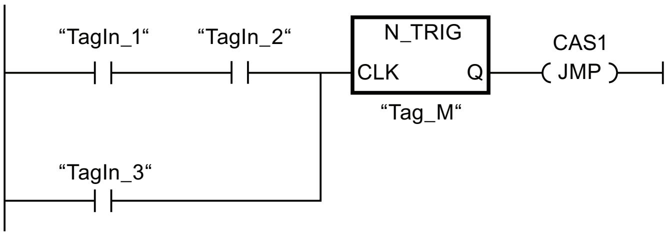
Parameters

The following table shows the parameters of the "Scan RLO for negative signal edge" instruction:

Parameters	Declaration	Data type	Memory area	Description
CLK	Input	BOOL	I, Q, M, D, L	Current RLO
<Operand>	InOut	BOOL	I, Q, M, D, L	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	I, Q, M, D, L	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO of the previous query is saved in the edge memory bit "Tag_M". If there is a change in the signal state of the RLO from "1" to "0", the program jumps to jump label CAS1.

Overview of the valid data types (Page 741)

Timer operations

TP: Generate pulse

Description

The instruction "Generate pulse" sets output Q for duration PT. The instruction is started when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive signal edge). The programmed time PT begins when the instruction starts. Output Q is set for the duration PT, regardless of the subsequent course of the input signal. Even if a new positive signal edge is detected, the signal state at the output Q is not affected as long as the PT time is running.

The current time value can be queried at the ET output. The time value starts at T#0s and ends when the value of duration PT is reached. If duration PT is reached and the signal state at input IN is "0", the ET output is reset.

Each call of the "Generate pulse" instruction must be assigned an IEC timer in which the instruction data is stored. An IEC timer is a structure of the data type IEC_TIMER or TP that you can declare as follows:

- Declaration of a data block of system data type IEC_TIMER (for example, "MyIEC_TIMER")
- Declaration as a local tag of the type TP in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. Querying the data is only identical from the call of the instruction to the next call of the instruction.

The execution of the "Generate pulse" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

Parameters

The following table shows the parameters of the "Generate pulse" instruction:

Parameters	Declaration	Data type	Memory area	Description
IN	Input	BOOL	I, Q, M, D, L	Start input
PT	Input	TIME	I, Q, M, D, L or constant	Duration of the pulse. The value of the PT parameter must be positive.
Q	Output	BOOL	I, Q, M, D, L	Pulse output
ET	Output	TIME	I, Q, M, D, L	Current time value

For additional information on valid data types, refer to "See also".

Pulse diagram

The following figure shows the pulse diagram of the "Generate pulse" instruction:

Overview of the valid data types (Page 741)

Example of controlling room temperature (Page 1209)

TON: Generate on-delay

Description

The instruction "Generate on-delay" delays setting of the output Q by the programmed duration PT. The instruction is started when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive signal edge). The programmed time PT begins when the instruction starts. When the duration PT expires, the output Q has the signal state "1". Output Q remains set as long as the start input is still "1". When the signal state at the start input changes from "1" to "0", the Q output is reset. The timer function is started again when a new positive signal edge is detected at the start input.

The current time value can be queried at the ET output. The time value starts at T#0s and ends when the value of duration PT is reached. The ET output is reset as soon as the signal state at the IN input changes to "0".

Each call of the "Generate on-delay" instruction must be assigned to an IEC timer in which the instruction data is stored. An IEC timer is a structure of the data type IEC_TIMER or TON that you can declare as follows:

- Declaration of a data block of system data type IEC_TIMER (for example, "MyIEC_TIMER")
- Declaration as a local tag of the type TON in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. Querying the data is only identical from the call of the instruction to the next call of the instruction.

The execution of the "Generate on-delay" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

Parameters

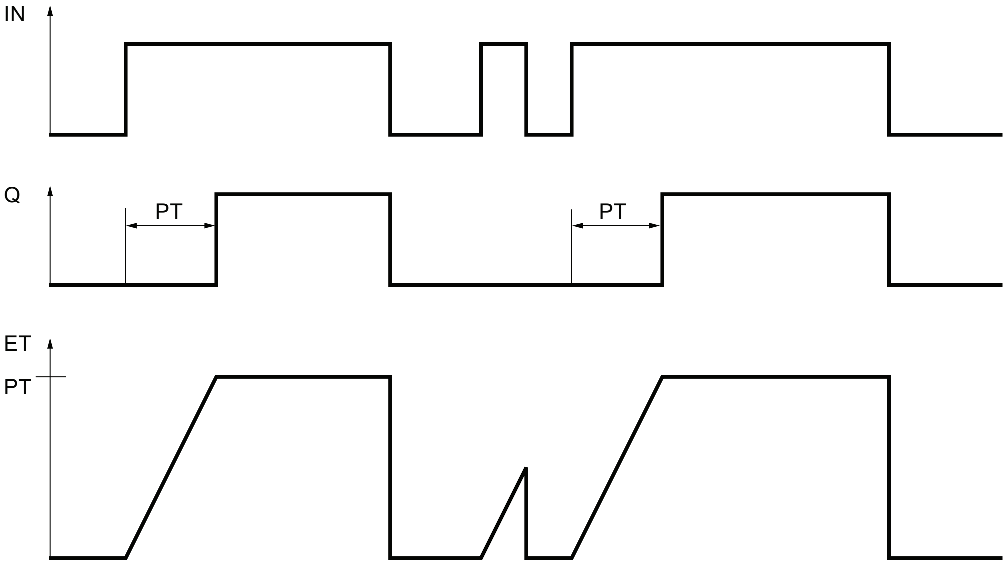
The following table shows the parameters of the "Generate on-delay" instruction:

Parameters	Declaration	Data type	Memory area	Description
IN	Input	BOOL	I, Q, M, D, L	Start input
PT	Input	TIME	I, Q, M, D, L or constant	Duration of the on delay. The value of the PT parameter must be positive.
Q	Output	BOOL	I, Q, M, D, L	Output that is set when the time PT expires.
ET	Output	TIME	I, Q, M, D, L	Current time value

For additional information on valid data types, refer to "See also".

Pulse diagram

The following figure shows the pulse diagram of the "Generate on-delay" instruction:



See also

Overview of the valid data types (Page 741)

TOF: Generate off-delay

Description

The instruction "Generate off-delay" delays resetting of the output Q by the programmed duration PT. The Q output is set when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive signal edge). When the signal state at input IN changes back to "0", the programmed time PT starts. Output Q remains set as long as the duration PT is running. When duration PT expires, the Q output is reset. If the signal state at the IN input changes to "1" before the duration PT expires, the time is reset. The signal state at the output Q will continue to be "1".

The current time value can be queried at the ET output. The time value starts at T#0s and ends when the value of duration PT is reached. When the duration PT expires, the ET output remains set to the current value until input IN changes back to "1". If input IN switches to "1" before the duration PT has expired, the ET output is reset to the value T#0s.

Each call of the "Generate off-delay" instruction must be assigned an IEC timer in which the instruction data is stored. An IEC timer is a structure of the data type IEC_TIMER or TOF that you can declare as follows:

- Declaration of a data block of system data type IEC_TIMER (for example, "MyIEC_TIMER")
- Declaration as a local tag of the type TOF in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. Querying the data is only identical from the call of the instruction to the next call of the instruction.

The execution of the "Generate off-delay" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

Parameters

The following table shows the parameters of the "Generate off-delay" instruction:

Parameters	Declaration	Data type	Memory area	Description
IN	Input	BOOL	I, Q, M, D, L	Start input
PT	Input	TIME	I, Q, M, D, L or constant	Duration of the off delay. The value of the PT parameter must be positive.
Q	Output	BOOL	I, Q, M, D, L	Output that is reset when the timer PT expires.
ET	Output	TIME	I, Q, M, D, L	Current time value

For additional information on valid data types, refer to "See also".

Pulse diagram

The following figure shows the pulse diagram of the "Generate off-delay" instruction:

Overview of the valid data types (Page 741)

TONR: Time accumulator

Description

The "Time accumulator" instruction accumulates time values within a period set by parameter PT. When the signal state at input IN changes from "0" to "1" (positive signal edge), the instruction executes and the duration PT starts. While the duration PT is running, the timer values are accumulated that are recorded when the IN input has signal state "1". The accumulated time is written to output ET and can be queried there. When the duration PT expires, the output Q has the signal state "1". The Q parameter remains set to "1", even when the signal state at the IN parameter changes from "1" to "0" (negative signal edge).

The R input resets the outputs ET and Q regardless of the signal state at the start input.

Each call of the "Time accumulator" instruction must be assigned to an IEC timer in which the instruction data is stored. An IEC timer is a structure of the data type IEC_TIMER or TONR that you can declare as follows:

- Declaration of a data block of system data type IEC_TIMER (for example, "MyIEC_TIMER")
- Declaration as a local tag of the type TONR in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. Querying the data is only identical from the call of the instruction to the next call of the instruction.

The execution of the "Time accumulator" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

Parameters

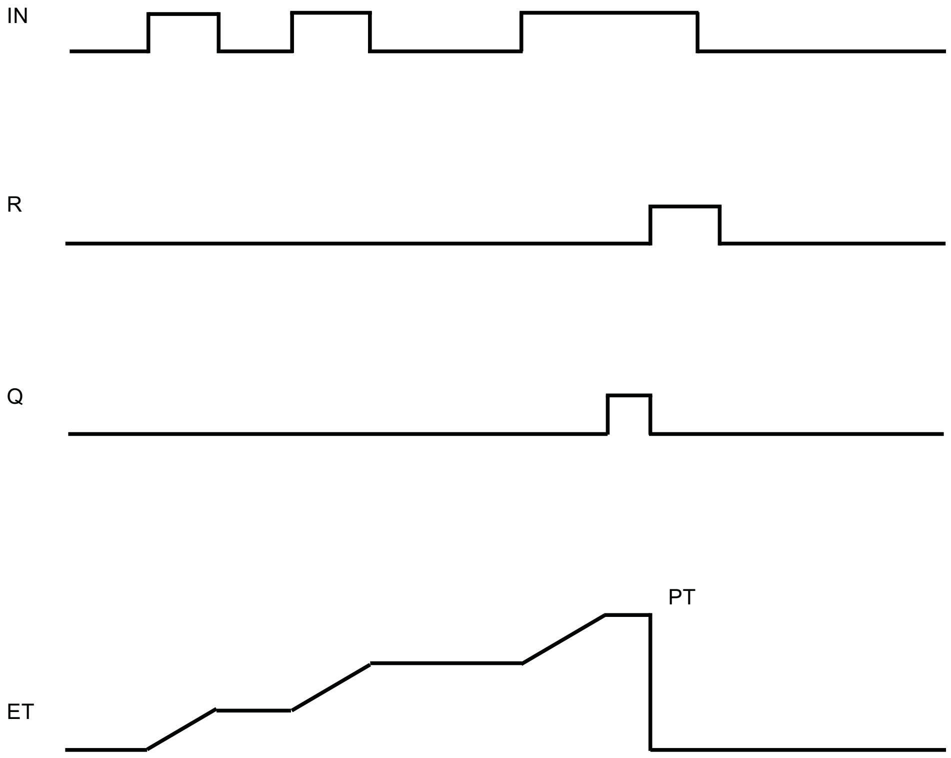
The following table shows the parameters of the "Time accumulator" instruction:

Parameters	Declaration	Data type	Memory area	Description
IN	Input	BOOL	I, Q, M, D, L	Start input
R	Input	BOOL	I, Q, M, D, L	Reset input
PT	Input	TIME	I, Q, M, D, L or constant	Maximum duration of time recording The value of the PT parameter must be positive.
Q	Output	BOOL	I, Q, M, D, L	Output that is set when the time PT expires.
ET	Output	TIME	I, Q, M, D, L	Accumulated time

For additional information on valid data types, refer to "See also".

Pulse diagram

The following figure shows the pulse diagram of the "Time accumulator" instruction:



See also

Overview of the valid data types (Page 741)

---(TP)---: Start pulse timer

Description

The "Start pulse timer" instruction starts an IEC timer with a specified duration as pulse. The IEC timer is started when the result of logic operation (RLO) changes from "0" to "1" (positive signal edge). The IEC timer runs for the specified time regardless of any subsequent changes in the RLO. The run of the IEC timer is also not affected by the detection of a new positive signal edge. As long as the IEC timer is running, the querying of the timer status for "1" returns the signal state "1". When the IEC timer has expired, the timer status returns the signal state "0".

The "Start pulse timer" instruction stores its data in a structure of the data type IEC_TIMER or TP. You can declare the structure as follows:

- Declaration of a data block of system data type IEC_TIMER (for example, "MyIEC_TIMER")
- Declaration as a local tag of the type TP in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_TIMER)

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. Querying the data is only identical from the call of the instruction to the next call of the instruction.

The current timer status is stored in the Q structure component of the IEC timer. You can use a normally open contact to query timer status for "1" or a normally closed contact for "0".

The execution of the "Start pulse timer" instruction assumes a preceding logic operation. It can be placed only at the end of the network.

Parameters

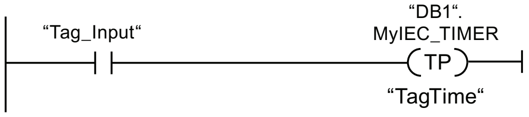
The following table shows the parameters of the instruction "Start pulse timer":

Parameters	Declaration	Data type	Memory area	Description
<Time duration>	Input	TIME	I, Q, M, D, L or constant	Duration with which the IEC timer runs
<IEC timer>	InOut	IEC_TIMER/TP	D, L	IEC timer that is started

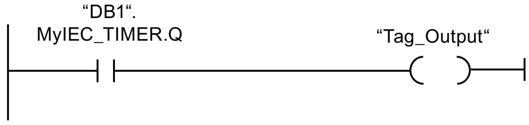
For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The "Start pulse timer" instruction is executed when the signal state of the operand "Tag_Input" changes from "0" to "1". Timer "DB1."MyIEC_TIMER starts running for the time duration that is stored in operand "TagTime".



As long as the timer "DB1".MyIEC_TIMER is running, the timer status ("DB1"MyIEC_TIMER.Q) has the signal state "1" and the operand "Tag_Output" is set. When the IEC timer has expired, the signal state of the timer status changes back to "0" and the "Tag_Output" operand is reset.

See also

Overview of the valid data types (Page 741)

---(TON)---: Start on-delay timer

Description

The "Start on-delay timer" instruction starts an IEC timer with a specified duration as on-delay timer. The IEC timer is started when the result of logic operation (RLO) changes from "0" to "1" (positive signal edge). The IEC timer runs for the specified time. A query of the timer status for "1" returns signal state "1" if the time has expired and the RLO at the input of the instruction is "1". If the RLO changes to "0" before the time expires, the IEC timer is reset. In this case, querying the timer status for "1" returns signal state "0". The IEC timer restarts when the next positive signal edge is detected at the input of the instruction.

The "Start on-delay timer" instruction stores its data in a structure of the data type IEC_TIMER or TON. You can declare the structure as follows:

- Declaration of a data block of system data type IEC_TIMER (for example, "MyIEC_TIMER")
- Declaration as a local tag of the type TON in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_TIMER)

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. Querying the data is only identical from the call of the instruction to the next call of the instruction.

The current timer status is stored in the Q structure component of the IEC timer. You can use a normally open contact to query timer status for "1" or a normally closed contact for "0".

The execution of the "Start on-delay timer" instruction assumes a preceding logic operation. It can be placed only at the end of the network.

Parameters

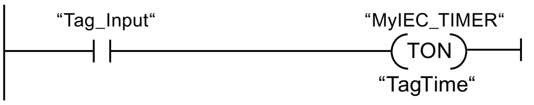
The following table shows the parameters of the instruction "Start on-delay timer":

Parameters	Declaration	Data type	Memory area	Description
<Time duration>	Input	TIME	I, Q, M, D, L or constant	Duration with which the IEC timer runs
<IEC timer>	InOut	IEC_TIMER/TON	D, L	IEC timer that is started

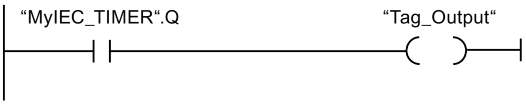
For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The "Start on-delay timer" instruction is executed when the signal state of the operand "Tag_Input" changes from "0" to "1". Timer "MyIEC_TIMER" starts running for the time duration that is stored in operand "TagTime".



If the timer "MyIEC_TIMER" has expired and the operand "Tag_Input" has the signal state "1", querying the timer status ("MyIEC_TIMER".Q) returns signal state "1" and the "Tag_Output" operand is set. When the signal state of the operand "Tag_Input" changes to "0", the querying of the timer status returns the signal state "0" and the operand "Tag_Output" is reset.

See also

Overview of the valid data types (Page 741)

---(TOF)---: Start off-delay timer

Description

The "Start off-delay timer" instruction starts an IEC timer with a specified duration as off-delay timer. The query of the timer status for "1" returns the signal state "1" if the result of the logic operation (RLO) at the input of the instruction has the signal state "1". When the RLO changes from "1" to "0" (negative signal edge), the IEC timer starts with the specified time. The timer status remains at signal state "1" as long as the IEC timer is running. When the timer has run out and the RLO at the input of the instruction has the signal state "0", the timer status is set to the signal state "0". If the RLO changes to "1" before the time expires, the IEC timer is reset and the timer status remains at signal state "1".

The "Start off-delay timer" instruction stores its data in a structure of the data type IEC_TIMER or TOF. You can declare the structure as follows:

- Declaration of a data block of system data type IEC_TIMER (for example, "MyIEC_TIMER")
- Declaration as a local tag of the type TOF in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_TIMER)

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. Querying the data is only identical from the call of the instruction to the next call of the instruction.

The current timer status is stored in the Q structure component of the IEC timer. You can use a normally open contact to query timer status for "1" or a normally closed contact for "0".

The execution of the "Start off-delay timer" instruction assumes a preceding logic operation. It can be placed only at the end of the network.

Parameters

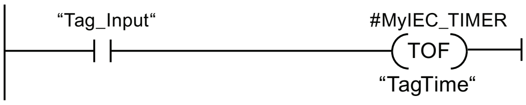
The following table shows the parameters of the instruction "Start off-delay timer":

Parameters	Declaration	Data type	Memory area	Description
<Time duration>	Input	TIME	I, Q, M, D, L or constant	Duration with which the IEC timer runs
<IEC timer>	InOut	IEC_TIMER/TOF	D, L	IEC timer that is started

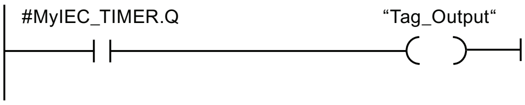
For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The "Start off-delay timer" instruction is executed when the signal state of the operand "Tag_Input" changes from "1" to "0". Timer #MyIEC_TIMER starts running for the time duration that is stored in operand "TagTime".



As long as timer #MyIEC_TIMER is running, the query of the timer status (#MyIEC_TIMER.Q) returns the signal state "1" and operand "Tag_Output" is set. If the timer has expired and the operand "Tag_Input" has the signal state "0", the query of the timer status returns the signal state "0". If the signal state of the operand "Tag_Input" changes to "1" before timer #MyIEC_TIMER expires, the timer is reset. When the signal state of the operand "Tag_Input" is "1", the query of the timer status returns the signal state "1".

See also

Overview of the valid data types (Page 741)

---(TONR)---: Time accumulator

Description

The "Time accumulator" instruction records how long the signal is at the input of instruction "1". The instruction is started when the result of logic operation (RLO) changes from "0" to "1" (positive signal edge). The time is recorded as long at the RLO is "1". If the RLO changes to "0", the instruction is halted. If the RLO changes back to "1", the time recording is continued. The query of the timer status for "1" returns the signal state "1" if the recorded time exceeds the value of the specified duration and the RLO at the input of coil is "1".

The timer status and the currently expired timer can be reset to "0" using the "Reset timer" instruction.

The "Time accumulator" instruction stores its data in a structure of the data type IEC_TIMER or TONR. You can declare the structure as follows:

- Declaration of a data block of system data type IEC_TIMER (for example, "MyIEC_TIMER")
- Declaration as a local tag of the type TONR in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_TIMER)

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. Querying the data is only identical from the call of the instruction to the next call of the instruction.

The current timer status is stored in the Q structure component of the IEC timer. You can use a normally open contact to query timer status for "1" or a normally closed contact for "0".

The execution of the "Time accumulator" instruction requires a preceding logic operation. It can be placed only at the end of the network.

Parameters

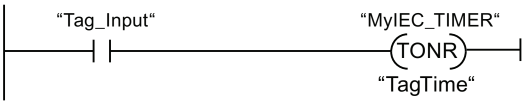
The following table shows the parameters of the "Time accumulator" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Time duration>	Input	TIME	I, Q, M, D, L or constant	Duration with which the IEC timer runs
<IEC timer>	InOut	IEC_TIMER/TONR	D, L	IEC timer that is started

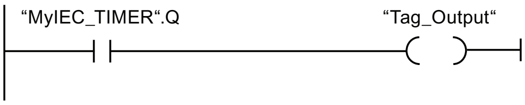
For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The "Time accumulator" instruction executes on a positive signal edge in the RLO. The time is recorded as long as the operand "Tag_Input" has the signal state "1".



If the recorded time exceeds the value of the operand "TagTime", the query of the timer status ("MyIEC_TIMER".Q) returns the signal state "1" and the operand "Tag_Output" is set.

See also

Overview of the valid data types (Page 741)

---(RT)---: Reset timer

Description

The "Reset timer" instruction resets an IEC timer to "0". The instruction is only executed if the result of logic operation (RLO) at the input of the coil is "1". If current is flowing to the coil (RLO is "1"), the structure components of the timer in the specified data block are reset to "0". If the RLO at the input of the instruction is "0", the timer remains unchanged.

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

You assign the "Reset timer" instruction an IEC timer that has been declared in the program.

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. Querying the data is only identical from the call of the instruction to the next call of the instruction.

Parameters

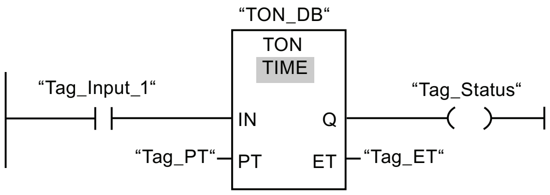
The following table shows the parameters of the instruction "Reset timer":

Parameters	Declaration	Data type	Memory area	Description
<IEC timer>	Output	IEC_TIMER, TON, TOF, TP	D, L	IEC timer that is reset.

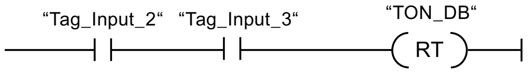
For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The "Generate on-delay" instruction executes when the signal state of the "Tag_Input_1" operand changes from "0" to "1". The timer stored in the "TON_DB" instance data block starts running for the time duration specified by operand "Tag_PT".



If operands "Tag_Input_2" and "Tag_Input_3" have the signal state "1", the "Reset timer" instruction is executed and the timer stored in the "TON_DB" data block is reset.

See also

Overview of the valid data types (Page 741)

---(PT)---: Load time duration

Description

The instruction "Load time duration" sets the duration of an IEC timer. The instruction is executed in every cycle when the result of logic operation (RLO) at the input of the instruction has the signal state "1". The instruction writes the specified time to the structure of the specified IEC timer.

Note

If the specified IEC timer is running while the instruction executes, the instruction overwrites the current time of the specified IEC timer. This can change the timer status of the IEC timer.

You assign an IEC timer declared in the program to the "Load time duration" instruction.

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. Querying the data is only identical from the call of the instruction to the next call of the instruction.

Parameters

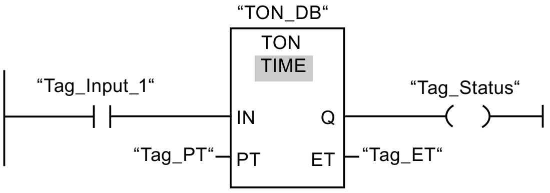
The following table shows the parameters of the "Load time duration" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Time duration>	Input	TIME	I, Q, M, D, L or constant	Time duration that is set
<IEC timer>	Output	IEC_TIMER, TON, TOF, TP	D, L	IEC timer whose duration is set

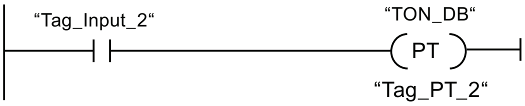
For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The "Generate on-delay" instruction executes when the signal state of the "Tag_Input_1" operand changes from "0" to "1". The IEC timer stored in the "TON_DB" instance data block starts running for the time duration specified by operand "Tag_PT".



When the "Tag_Input_2" operand has signal state "1", the "Load time duration" instruction executes. The instruction writes the time duration "Tag_PT_2" to the "TON_DB" instance data block, overwriting the value of the "Tag_PT" operand in the data block. The signal state of the timer status may therefore change at the next query.

Overview of the valid data types (Page 741)

Counter operations

CTU: Count up

Description

The instruction "Count up" counts up the value at output CV. When the signal state at the CU input changes from "0" to "1" (positive signal edge), the instruction executes and the current count value at the CV output is incremented by one. When the instruction executes for the first time, the current count value at the CV output is set to zero. The count value is incremented each time a positive signal edge is detected, until it reaches the high limit for the data type specified at the CV output. When the high limit is reached, the signal state at the CU input no longer has an effect on the instruction.

You can scan the counter status at the Q output. The signal state at the Q output is decided by the parameter PV. If the current count value is greater than or equal to the value of the PV parameter, the Q output is set to signal state "1". In all other cases, the Q output has signal state "0". You can also specify a constant for the PV parameter.

The value at the CV output is reset to zero when the signal state at the R input changes to "1". As long as the R input has signal state "1", the signal state at the CU input has no effect on the instruction.

Each call of the "Count up" instruction must be assigned an IEC counter in which the instruction data is stored. An IEC counter is a structure with one of the following data types:

- Data block of system data type IEC_counter (global DB):
  - IEC_SCOUNTER / IEC_USCOUNTER
  - IEC_COUNTER / IEC_UCOUNTER
  - IEC_DCOUNTER / IEC_UDCOUNTER
- Local tag:
  - CTU_SINT / CTU_USINT
  - CTU_INT / CTU_UINT
  - CTU_DINT / CTU_UDINT

You can declare an IEC counter as follows:

- Declaration of a data block of system data type IEC_COUNTER (for example, "MyIEC_COUNTER")
- Declaration as a local tag of the type CTU in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_COUNTER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The execution of the "Count up" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

Parameters

The following table shows the parameters of the "Count up" instruction:

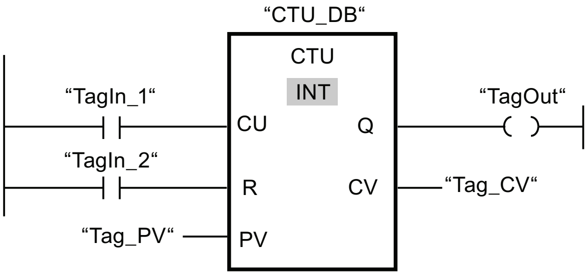
Parameters	Declaration	Data type	Memory area	Description
CU	Input	BOOL	I, Q, M, D, L	Count input
R	Input	BOOL	I, Q, M, D, L	Reset input
PV	Input	Integers	I, Q, M, D, L or constant	Value at which the output Q is set.
Q	Output	BOOL	I, Q, M, D, L	Counter status
CV	Output	Integers	I, Q, M, D, L	Current count value

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



When the signal state of the "TagIn_1" operand changes from "0" to "1", the "Count up" instruction executes and the current count value of the "Tag_CV" operand is incremented by one. With each additional positive signal edge, the count value is incremented until the high limit of the specified data type (32 767) is reached.

The value of the PV parameter is adopted as the limit for determining the "TagOut" output. The "TagOut" output has signal state "1" as long as the current count value is greater than or equal to the value of the "Tag_PV" operand. In all other cases, the "TagOut" output has signal state "0".

See also

Overview of the valid data types (Page 741)

CTD: Count down

Description

You can use the "Count down" instruction to decrement the value at output CV. When the signal state at the CD input changes from "0" to "1" (positive signal edge), the instruction executes and the current count value at the CV output is decremented by one. When the instruction executes the first time, the count value of the CV parameter is set to the value of the PV parameter. Each time a positive signal edge is detected, the count value is decremented until it reaches the low limit value of the specified data type. When the low limit is reached, the signal state at the CD input no longer has an effect on the instruction.

You can scan the counter status at the Q output. If the current count value is less than or equal to zero, the Q output is set to signal state "1". In all other cases, the Q output has signal state "0". You can also specify a constant for the PV parameter.

The value at the CV output is set to the value of the PV parameter when the signal state at the LD input changes to "1". As long as the LD input has signal state "1", the signal state at the CD input has no effect on the instruction.

Each call of the "Count down" instruction must be assigned an IEC counter in which the instruction data is stored. An IEC counter is a structure with one of the following data types:

- Data block of system data type IEC_counter (global DB):
  - IEC_SCOUNTER / IEC_USCOUNTER
  - IEC_COUNTER / IEC_UCOUNTER
  - IEC_DCOUNTER / IEC_UDCOUNTER
- Local tag:
  - CTU_SINT / CTU_USINT
  - CTU_INT / CTU_UINT
  - CTU_DINT / CTU_UDINT

You can declare an IEC counter as follows:

- Declaration of a data block of system data type IEC_COUNTER (for example, "MyIEC_COUNTER")
- Declaration as a local tag of the type CTD in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_COUNTER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC counter is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The execution of the "Count down" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

Parameters

The following table shows the parameters of the "Count down" instruction:

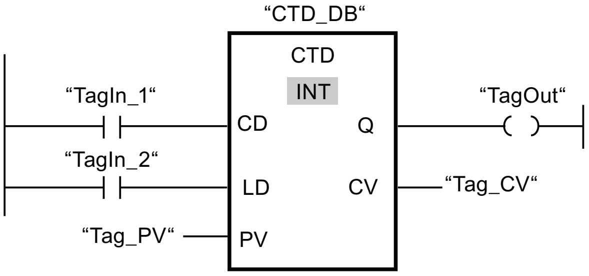
Parameters	Declaration	Data type	Memory area	Description
CD	Input	BOOL	I, Q, M, D, L	Count input
LD	Input	BOOL	I, Q, M, D, L	Load input
PV	Input	Integers	I, Q, M, D, L or constant	Value at which the output Q is set.
Q	Output	BOOL	I, Q, M, D, L	Counter status
CV	Output	Integers	I, Q, M, D, L	Current count value

You can select the data type of the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



When the signal state of the "TagIn_1" operand changes from "0" to "1", the "Count down" instruction executes and the value at the "Tag_CV" output is decremented by one. With each additional positive signal edge, the count value is decremented until the low limit of the specified data type (-32 768) is reached.

The "TagOut" output has signal state "1" as long as the current count value is less than or equal to zero. In all other cases, the "TagOut" output has signal state "0".

See also

Overview of the valid data types (Page 741)

CTUD: Count up and down

Description

You can use the "Count up and down" instruction to increment and decrement the count value at the CV output. If the signal state at the CU input changes from "0" to "1" (positive signal edge), the current count value is incremented by one and stored at the CV output. If the signal state at the CD input changes from "0" to "1" (positive signal edge), the count value at the CV output is decremented by one. If there is a positive signal edge at the CU and CD inputs in one program cycle, the current count value at the CV output remains unchanged.

The count value can be incremented until it reaches the high limit of the data type specified at the CV output. When the high limit value is reached, the count value is no longer incremented on a positive signal edge. When the low limit of the specified data type is reached, the count value is not decremented any further.

When the signal state at the LD input changes to "1", the count value at the CV output is set to the value of the PV parameter. As long as the LD input has the signal state "1", the signal state at the CU and CD inputs has no effect on the instruction.

The count value is set to zero when the signal state at the R input changes to "1". As long as the R input has signal state "1", a change in the the signal state of the CU, CD and LD inputs has no effect on the "Count up and down" instruction.

You can scan the current status of the up counter at the QU output. If the current count value is greater than or equal to the value of the PV parameter, the QU output is set to signal state "1". In all other cases, the QU output has signal state "0". You can also specify a constant for the PV parameter.

You can scan the current status of the down counter at the QD output. If the current count value is less than or equal to zero, the QD output is set to signal state "1". In all other cases, the QD output has signal state "0".

Each call of the "Count up and down" instruction must be assigned an IEC counter in which the instruction data is stored. An IEC counter is a structure with one of the following data types:

- Data block of system data type IEC_counter (global DB):
  - IEC_SCOUNTER / IEC_USCOUNTER
  - IEC_COUNTER / IEC_UCOUNTER
  - IEC_DCOUNTER / IEC_UDCOUNTER
- Local tag:
  - CTU_SINT / CTU_USINT
  - CTU_INT / CTU_UINT
  - CTU_DINT / CTU_UDINT

You can declare an IEC counter as follows:

- Declaration of a data block of system data type IEC_COUNTER (for example, "MyIEC_COUNTER")
- Declaration as a local tag of the type CTUD in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_COUNTER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC counter is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The execution of the "Count up and down" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

Parameters

The following table shows the parameters of the "Count up and down" instruction:

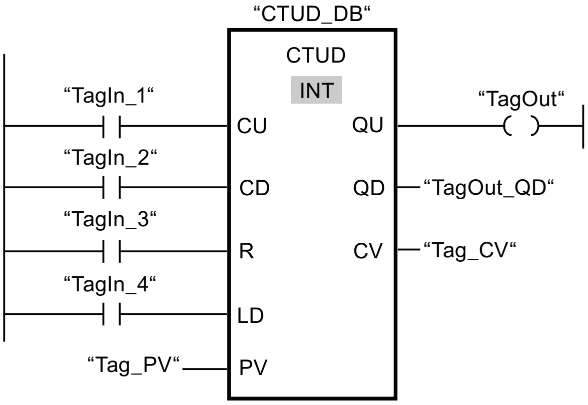
Parameters	Declaration	Data type	Memory area	Description
CU	Input	BOOL	I, Q, M, D, L	Count up input
CD	Input	BOOL	I, Q, M, D, L	Count down input
R	Input	BOOL	I, Q, M, D, L	Reset input
LD	Input	BOOL	I, Q, M, D, L	Load input
PV	Input	Integers	I, Q, M, D, L or constant	Value at which the output QU / QD is set.
QU	Output	BOOL	I, Q, M, D, L	Status of the counter up
QD	Output	BOOL	I, Q, M, D, L	Status of the counter down
CV	Output	Integers	I, Q, M, D, L	Current count value

You can select the data type of the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



If the signal state at the "TagIn_1" or "TagIn_2" input changes from "0" to "1" (positive signal edge), the "Count up and down" instruction is executed. When there is a positive signal edge at the "TagIn_1" input, the current count value is incremented by one and stored at the "Tag_CV" output. When there is a positive signal edge at the "TagIn_2" input, the count value is decremented by one and stored at the "Tag_CV" output. When there is a positive signal edge at the CU input, the count value is incremented until it reaches the high limit of 32 767. If input CD has a positive signal edge, the count value is decremented until it reaches the low limit value of -32 768.

The "TagOut" output has signal state "1" as long as the current count value is greater than or equal to the value at the "Tag_PV" input. In all other cases, the "TagOut" output has signal state "0".

The "TagOut_QD" output has signal state "1" as long as the current count value is less than or equal to zero. In all other cases, the "TagOut_QD" output has signal state "0".

Comparator operations

CMP ==: Equal

Description

You can use the "Equal" instruction to determine if a first comparison value (<Operand1>) is equal to a second comparison value (<Operand2>).

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify the first comparison value (<Operand1>) in the operand placeholder above the instruction. Specify the second comparison value (<Operand2>) in the operand placeholder below the instruction.

The individual characters are compared by means of their ASCII code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character that is different decides the result of the comparison.

The following table shows examples of string comparisons:

<Operand1>	<Operand2>	RLO of instruction
'AA'	'AA'	1
'Hello World'	'HelloWorld'	0
'AA'	'aa'	0

You can also use the "Equal" instruction to compare individual characters of a string (STRING). The number of the character to be compared is given in brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

When IEC Check is selected, the operands to be compared must have the same data type. If IEC Check is not selected, the width (length) of the operands must be the same. When floating-point numbers are compared, the operands to be compared must have the same data type regardless of the setting for the IEC Check.

Parameters

The following table shows the parameters of the "Equal" instruction:

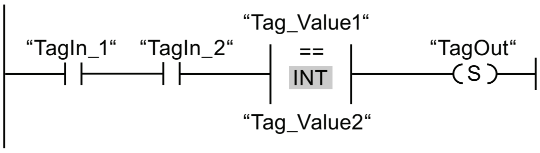
Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Input	Bit strings, integers, floating-point numbers, characters, TIME, DATE, TOD, DTL	I, Q, M, D, L or constant	First value to compare
<Operand2>	Input	Bit strings, integers, floating-point numbers, characters, TIME, DATE, TOD, DTL	I, Q, M, D, L or constant	Second value to compare

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also":

Example

The following example shows how the instruction works:



The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn_1" and "TagIn_2" have the signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" = "Tag_Value2").

See also

Overview of the valid data types (Page 741)

CMP <>: Not equal

Description

You can use the "Not equal" instruction to determine if a first comparison value (<Operand1>) is unequal to a second comparison value (<Operand2>).

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify the first comparison value (<Operand1>) in the operand placeholder above the instruction. Specify the second comparison value (<Operand2>) in the operand placeholder below the instruction.

The individual characters are compared by means of their ASCII code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character that is different decides the result of the comparison.

The following table shows examples of string comparisons:

<Operand1>	<Operand2>	RLO of instruction
'AA'	'aa'	1
'Hello World'	'HelloWorld'	1
'AA'	'AA'	0

You can also use the "Not equal" instruction to compare individual characters of a string (STRING). The number of the character to be compared is given in brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

When IEC Check is selected, the operands to be compared must have the same data type. If IEC Check is not selected, the width (length) of the operands must be the same. When floating-point numbers are compared, the operands to be compared must have the same data type regardless of the setting for the IEC Check.

Parameters

The following table shows the parameters of the "Not equal" instruction:

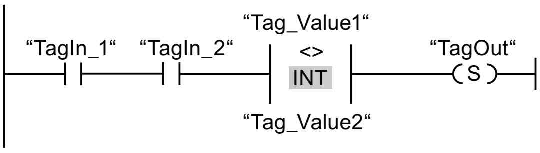
Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Input	Bit strings, integers, floating-point numbers, characters, TIME, DATE, TOD, DTL	I, Q, M, D, L or constant	First value to compare
<Operand2>	Input	Bit strings, integers, floating-point numbers, characters, TIME, DATE, TOD, DTL	I, Q, M, D, L or constant	Second value to compare

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn_1" and "TagIn_2" have the signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" <> "Tag_Value2").

See also

Overview of the valid data types (Page 741)

CMP >=: Greater or equal

Description

You can use the "Greater or equal" instruction to determine if a first comparison value (<Operand1>) is greater than or equal to a second comparison value (<Operand2>). Both values to be compared must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify the first comparison value (<Operand1>) in the operand placeholder above the instruction. Specify the second comparison value (<Operand2>) in the operand placeholder below the instruction.

The individual characters are compared by means of their ASCII code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character that is different decides the result of the comparison. If the left part of the longer string is identical to the shorter string, the longer string is considered greater.

The following table shows examples of string comparisons:

<Operand1>	<Operand2>	RLO of instruction
'BB'	'AA'	1
'AAA'	'AA'	1
'Hello World'	'Hello World'	1
'Hello World'	'HelloWorld'	0
'AA'	'aa'	0
'AAA'	'a'	0

You can also use the "Greater or equal" instruction to compare individual characters of a string (STRING). The number of the character to be compared is given in brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

When time values are compared, the RLO of the instruction is "1" if the point of time at <Operand1> is greater (more recent) than or equal to the point of time at <Operand2>.

Parameters

The following table shows the parameters of the "Greater or equal" instruction:

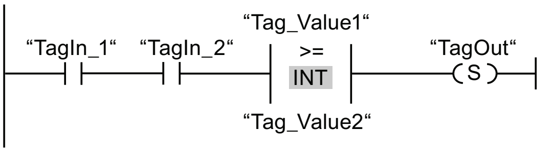
Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Input	Integers, floating-point numbers, characters, TIME, DATE, TOD, DTL	I, Q, M, D, L or constant	First value to compare
<Operand2>	Input	Integers, floating-point numbers, characters, TIME, DATE, TOD, DTL	I, Q, M, D, L or constant	Second value to compare

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn_1" and "TagIn_2" have the signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" >= "Tag_Value2").

CMP <=: Less or equal

Description

You can use the "Less or equal" instruction to determine if a first comparison value (<Operand1>) is less than or equal to a second comparison value (<Operand2>). Both values to be compared must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify the first comparison value (<Operand1>) in the operand placeholder above the instruction. Specify the second comparison value (<Operand2>) in the operand placeholder below the instruction.

The individual characters are compared by means of their ASCII code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character that is different decides the result of the comparison. If the left part of the longer string is identical to the shorter string, the shorter string is considered smaller.

The following table shows examples of string comparisons:

<Operand1>	<Operand2>	RLO of instruction
'AA'	'aa'	1
'AAA'	'a'	1
'Hello World'	'Hello World'	1
'HelloWorld'	'Hello World'	0
'BB'	'AA'	0
'AAA'	'AA'	0

You can also use the "Less or equal" instruction to compare individual characters of a string (STRING). The number of the character to be compared is given in brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

When time values are compared, the RLO of the instruction is "1" if the point of time at <Operand1> is less (less recent) than or equal to the point of time at <Operand2>.

Parameters

The following table shows the parameters of the "Less or equal" instruction:

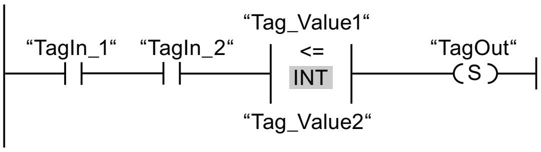
Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Input	Integers, floating-point numbers, characters, TIME, DATE, TOD, DTL	I, Q, M, D, L or constant	First value to compare
<Operand2>	Input	Integers, floating-point numbers, characters, TIME, DATE, TOD, DTL	I, Q, M, D, L or constant	Second value to compare

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn_1" and "TagIn_2" have the signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" <= "Tag_Value2").

See also

Overview of the valid data types (Page 741)

CMP >: Greater than

Description

You can use the "Greater than" instruction to determine if a first comparison value (<Operand1>) is greater than a second comparison value (<Operand2>). Both values to be compared must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify the first comparison value (<Operand1>) in the operand placeholder above the instruction. Specify the second comparison value (<Operand2>) in the operand placeholder below the instruction.

The individual characters are compared by means of their ASCII code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character that is different decides the result of the comparison. If the left part of the longer string is identical to the shorter string, the longer string is considered greater.

The following table shows examples of string comparisons:

<Operand1>	<Operand2>	RLO of instruction
'BB'	'AA'	1
'AAA'	'AA'	1
'AA'	'aa'	0
'AAA'	'a'	0

You can also use the "Greater than" instruction to compare individual characters of a string (STRING). The number of the character to be compared is given in brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

When time values are compared, the RLO of the instruction is "1" if the point of time at <Operand1> is greater (more recent) than the point of time at <Operand2>.

Parameters

The following table shows the parameters of the "Greater than" instruction:

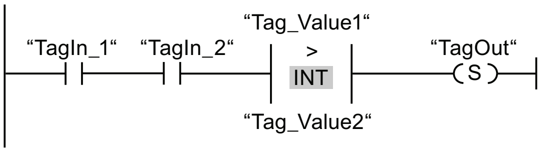
Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Input	Integers, floating-point numbers, characters, TIME, DATE, TOD, DTL	I, Q, M, D, L or constant	First value to compare
<Operand2>	Input	Integers, floating-point numbers, characters, TIME, DATE, TOD, DTL	I, Q, M, D, L or constant	Second value to compare

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn_1" and "TagIn_2" have the signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" > "Tag_Value2").

Overview of the valid data types (Page 741)

CMP <: Less than

Description

You can use the "Less than" instruction to determine if a first comparison value (<Operand1>) is less than a second comparison value (<Operand2>). Both values to be compared must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify the first comparison value (<Operand1>) in the operand placeholder above the instruction. Specify the second comparison value (<Operand2>) in the operand placeholder below the instruction.

The individual characters are compared by means of their ASCII code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character that is different decides the result of the comparison. If the left part of the longer string is identical to the shorter string, the shorter string is considered smaller.

The following table shows examples of string comparisons:

<Operand1>	<Operand2>	RLO of instruction
'AA'	'aa'	1
'AAA'	'a'	1
'BB'	'AA'	0
'AAA'	'AA'	0

You can also use the "Less than" instruction to compare individual characters of a string (STRING). The number of the character to be compared is given in brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

When time values are compared, the RLO of the instruction is "1" if the point of time at <Operand1> is less (less recent) than the point of time at <Operand2>.

Parameters

The following table shows the parameters of the "Less than" instruction:

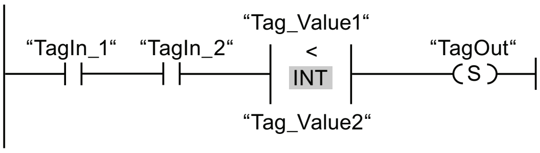
Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Input	Integers, floating-point numbers, characters, TIME, DATE, TOD, DTL	I, Q, M, D, L or constant	First value to compare
<Operand2>	Input	Integers, floating-point numbers, characters, TIME, DATE, TOD, DTL	I, Q, M, D, L or constant	Second value to compare

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn_1" and "TagIn_2" have the signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" < "Tag_Value2").

Example of detecting the fill level of a storage area (Page 1206)

IN_RANGE: Value within range

Description

You can use the "Value within range" instruction to determine if the value at the VAL input is within a specific value range.

You specify the limits of the value range with the MIN and MAX inputs. The "Value within range" instruction compares the value at the VAL input with the values of the MIN and MAX inputs and sends the result to the box output. If the value at the VAL input fulfills the MIN <= VAL or VAL <= MAX comparison, the box output has the signal state "1". If the comparison is not fulfilled, the box output has the signal state "0".

If the box input has the signal state "0", the "Value within range" instruction is not executed.

The comparison function can only execute if the values to be compared are of the same data type and the box input is interconnected. You can also specify a constant for the MIN, MAX and VAL inputs.

Parameters

The following table shows the parameters of the "Value within range" instruction:

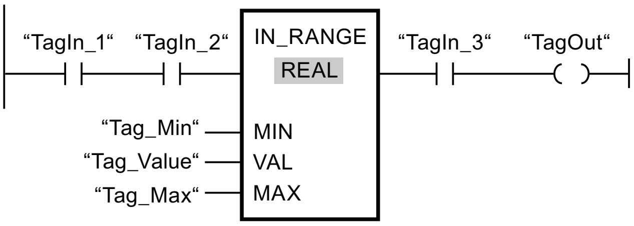
Parameters	Declaration	Data type	Memory area	Description
Box input	Input	BOOL	I, Q, M, D, L	Result of the previous logic operation
MIN	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Low limit of the value range
VAL	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Comparison value
MAX	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	High limit of the value range
Box output	Output	BOOL	I, Q, M, D, L	Result of the comparison

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also":

Example

The following example shows how the instruction works:



The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn_1" and "TagIn_2" have the signal state "1".
- The value of operand ""Tag_Value"" is within the value range, which is specified by the current values of operands "Tag_Min" and "Tag_Max"(MIN <= VAL or VAL <= MAX).
- The operand "TagIn_3" has the signal state "1".

See also

Overview of the valid data types (Page 741)

OUT_RANGE: Value outside range

Description

You can use the "Value outside range" instruction to determine if the value at the VAL input is outside a specific value range.

You specify the limits of the value range with the MIN and MAX inputs. The "Value outside range" instruction compares the value at the VAL input with the values of the MIN and MAX inputs and sends the result to the box output. If the value at the VAL input fulfills the MIN > VAL or VAL > MAX comparison, the box output has the signal state "1". The box output also has the signal state "1" if a specified operand with the REAL data type shows an invalid value.

The box output returns the signal state "0", if the value at input VAL does not satisfy the MIN > VAL or VAL > MAX condition.

If the box input has the signal state "0", the "Value outside range" instruction is not executed.

The comparison function can only execute if the values to be compared are of the same data type and the box input is interconnected. You can also specify a constant for the MIN, MAX and VAL inputs.

Parameters

The following table shows the parameters of the "Value outside range" instruction:

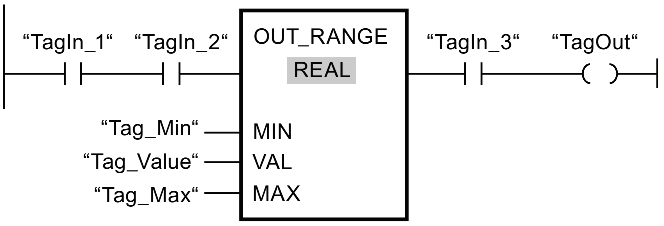
Parameters	Declaration	Data type	Memory area	Description
Box input	Input	BOOL	I, Q, M, D, L	Result of the previous logic operation
MIN	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Low limit of the value range
VAL	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Comparison value
MAX	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	High limit of the value range
Box output	Output	BOOL	I, Q, M, D, L	Result of the comparison

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn_1" and "TagIn_2" have the signal state "1".
- The value of operand "Tag_Value" is outside the value range, which is specified by the current values of operands "Tag_Min" and ""Tag_Max" (MIN > VAL or VAL > MAX).
- The operand "TagIn_3" has the signal state "1".

Overview of the valid data types (Page 741)

----I OK I----: Check validity

Description

The "Check validity" instruction checks if the value of an operand (<Operand>) is a valid floating-point number. The query is started in each program cycle when the signal state at the input of the instruction is "1".

The output of the instruction has signal state "1" when the value of the operand is a valid floating-point number at the time of the query and the input of the instruction has signal state "1". In all other cases, the signal state at the output of the "Check validity" instruction is "0".

You can use the "Check validity" instruction together with the EN mechanism. If you connect the instruction box to an EN enable input, the enable input is set only when the result of the validity query of the value is positive. You can use this function to ensure that an instruction is enabled only when the value of the specified operand is a valid floating-point number.

Parameters

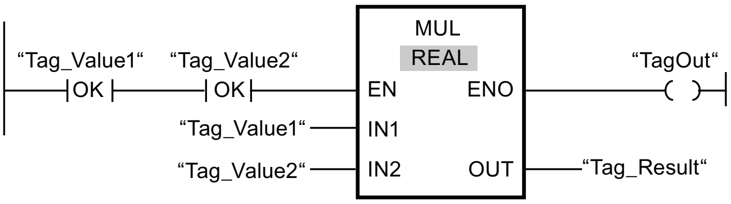
The following table shows the parameters of the "Check validity" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	Floating-point numbers	I, Q, M, D, L or constant	Value to be queried.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



When the values of operands "Tag_Value1" and "Tag_Value2" are valid floating-point numbers, the "Multiply" (MUL) instruction is activated and the ENO output is set. When the "Multiply" (MUL) instruction is executed, the value of operand "Tag_Value1" is multiplied by the value of operand "Tag_Value2". The product of the multiplication is stored in operand "Tag_Result". If the instruction is executed without errors, the ENO and "TagOut" outputs are set to signal state "1".

See also

Overview of the valid data types (Page 741)

----I NOT_OK I----: Check invalidity

Description

The "Check invalidity" instruction checks if the value of an operand (<Operand>) is an invalid floating-point number. The query is started in each program cycle when the signal state at the input of the instruction is "1".

The output of the instruction has signal state "1" when the value of the operand is an invalid floating-point number at the time of the query and the input of the instruction has signal state "1". In all other cases, the signal state at the output of the "Check invalidity" instruction is "0".

Parameters

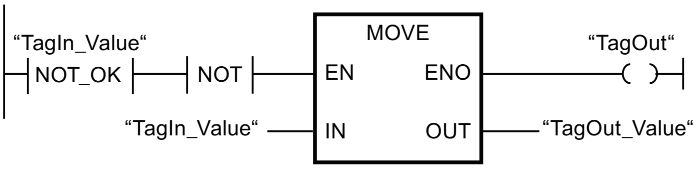
The following table shows the parameters of the "Check invalidity" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	Floating-point numbers	I, Q, M, D, L or constant	Value to be queried.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



If the value at the operand "TagIn_Value" is an invalid floating-point number, the "Move value" (MOVE) instruction is not executed. The "TagOut" output is reset to signal state "0".

Overview of the valid data types (Page 741)

Math functions

CALCULATE: Calculate

Description

You can use the "Calculate" instruction to define and execute an expression for calculating mathematical operations or complex logic combinations, depending on the selected data type.

You can select the data type of the instruction from the "<???>" drop-down list of the instruction box. Depending on the data type selected, you can combine the functions of certain instructions to perform a complex calculation. The information for the expression to be calculated is entered in a dialog, which you can open with the icon at the upper right edge of the instruction box. The expression can contain names of input parameters and the syntax of the instructions. Operand names and operand addresses cannot be specified.

The following table shows the instructions that can be executed together in the expression of the "Calculate" instruction, depending on the selected data type:

Data type	Instruction	Syntax	Example
Bit strings	AND: AND logic operation	AND	IN1 AND IN2 OR IN3
	OR: OR logic operation	OR	
	XOR: EXCLUSIVE OR logic operation	XOR	
	INV: Create ones complement	NOT	
	SWAP: Swap	SWAP	
Integers	ADD: Add	+	(IN1 + IN2) * IN3; (ABS(IN2))*(ABS(IN1))
	SUB: Subtract	-	
	MUL: Multiply	*	
	DIV: Divide	/	
	MOD: Return remainder of division	MOD	
	INV: Create ones complement	NOT	
	NEG: Create twos complement	-(in1)	
	ABS: Form absolute value	ABS( )	
Floating-point numbers	ADD: Add	+	((SIN(IN2)*SIN(IN2)+(SIN(IN3)*SIN(IN3))/IN3; (SQR(SIN(IN2))+(SQR(COS(IN3))/IN2
	SUB: Subtract	-	
	MUL: Multiply	*	
	DIV: Divide	/	
	NEG: Create twos complement	**	
	ABS: Form absolute value	ABS( )	
	SQR : Form square	SQR( )	
	SQRT: Form square root	SQRT( )	
	LN : Form natural logarithm	LN( )	
	EXP : Form exponential value	EXP( )	
	FRAC: Return fraction	FRAC( )	
	SIN: Form sine value	SIN( )	

Data type	Instruction	Syntax	Example
	COS: Form cosine value	COS( )	
	TAN: Form tangent value	TAN( )	
	ASIN: Form arcsine value	ASIN( )	
	ACOS: Form arccosine value	ACOS( )	
	ATAN: Form arctangent value	ATAN( )	
	NEG: Create twos complement	-(in1)	
	TRUNC: Truncate numerical value	TRUNC( )	
	ROUND: Round numerical value	ROUND( )	
	CEIL: Generate next higher integer from floating-point number	CEIL( )	
	FLOOR: Generate next lower integer from floating-point number	FLOOR( )	

In its initial state, the instruction box contains at least 2 inputs (IN1 and IN2). The number of inputs can be extended. The inserted inputs are numbered in ascending order in the box.

The values of the input parameters are used to execute the specified expression. Not all of the defined input parameters have to be used in the expression. The result of the instruction is transferred to the output OUT.

If you use inputs in the expression that are not available in the box, they are inserted automatically. This requires that there are no gaps in the numbering of the inputs to be newly defined in the expression. For example, you cannot use the IN4 input in the expression unless the IN3 input has been defined.

The "Calculate" instruction is only executed if the signal state at the enable input EN is "1". When all the individual instructions of the specified expression are executed without errors, the ENO enable output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The result of the "Calculate" instruction is outside the range permitted for the data type specified at the OUT output.
- A floating-point number has an invalid value.
- An error occurred during execution of one of the instructions in the expression.

Parameters

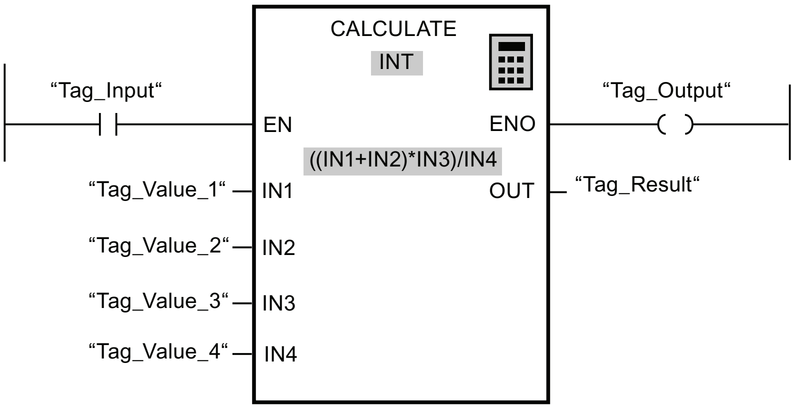
The following table shows the parameters of the "Calculate" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Bit strings, integers, floating-point numbers	I, Q, M, D, L or constant	First available input
IN2	Input	Bit strings, integers, floating-point numbers	I, Q, M, D, L or constant	Second available input
INn	Input	Bit strings, integers, floating-point numbers	I, Q, M, D, L or constant	Additionally inserted inputs
OUT	Output	Bit strings, integers, floating-point numbers	I, Q, M, D, L	Output to which the end result is to be transferred.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN1	"Tag_Value_1"	4
IN2	"Tag_Value_2"	4
IN3	"Tag_Value_3"	3

Parameters	Operand	Value
IN4	"Tag_Value_4"	2
OUT	"Tag_Result"	12

If the "Tag_Input" input has the signal state"1", the "Calculate" instruction is executed. The value of operand "Tag_Value_1" is added to the value of operand "Tag_Value_2". The sum is multiplied with the value of operand "Tag_Value_3". The product is divided by the value of operand "Tag_Value_4". The quotient is transferred as end result to the operand "Tag_Result" at the OUT output of the instruction. If the instruction is executed without errors, the ENO output and operand "Tag_Output" are set to "1".

Basics of the EN/ENO mechanism (Page 819)

ADD: Add

Description

You can use the "Add" instruction to add the value at input IN1 and the value at input IN2 and query the sum at output OUT (OUT = IN1+IN2).

In its initial state, the instruction box contains at least 2 inputs (IN1 and IN2). The number of inputs can be extended. The inserted inputs are numbered in ascending order in the box. When the instruction is executed, the values of all available input parameters are added. The sum is stored at the OUT output.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO enable output also returns the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The result of the instruction is outside the range permitted for the data type specified at the OUT output.
- A floating-point number has an invalid value.

Parameters

The following table shows the parameters of the "Add" instruction:

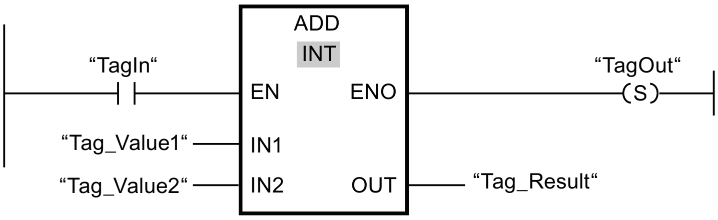
Parameters		Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	First number to be added
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Second number to be added
INn	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Optional input values that are added.
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Sum

You can select the data type of the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also":

Example

The following example shows how the instruction works:



If operand "TagIn" has the signal state "1", the "Add" instruction is executed. The value of operand "Tag_Value1" is added to the value of operand "Tag_Value2". The result of the addition is stored in operand "Tag_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

Basics of the EN/ENO mechanism (Page 819)

Inserting additional inputs and outputs in LAD elements (Page 927)

SUB: Subtract

Description

You can use the "Subtract" instruction to subtract the value at the IN2 input from the value at the IN1 input and query the difference at the OUT output (OUT = IN1-IN2).

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The result of the instruction is outside the range permitted for the data type specified at the OUT output.
- A floating-point number has an invalid value.

Parameters

The following table shows the parameters of the "Subtract" instruction:

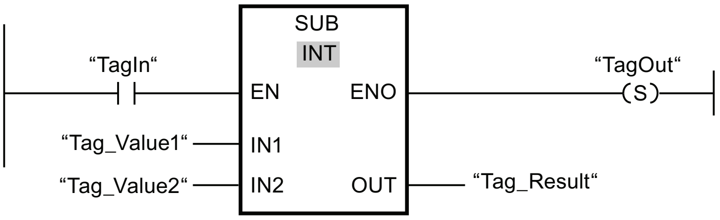
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Minuend
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Subtrahend
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Difference

You can select the data type of the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



If operand "TagIn" has the signal state "1", the "Subtract" instruction is executed. The value of operand "Tag_Value2" is subtracted from the value of operand "Tag_Value1". The result of the subtraction is stored in operand "Tag_Result". If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

MUL: Multiply

Description

You can use the "Multiply" instruction to multiply the value at the IN1 input by the value at the IN2 input and query the product at the OUT output (OUT = IN1*IN2).

The number of inputs can be expanded in the instruction box. The added inputs are numbered in ascending order in the box. When the instruction is executed, the values of all available input parameters are multiplied. The product is stored at the OUT output.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The result is outside the range permitted for the data type specified at the OUT output.
- A floating-point number has an invalid value.

Parameters

The following table shows the parameters of the "Multiply" instruction:

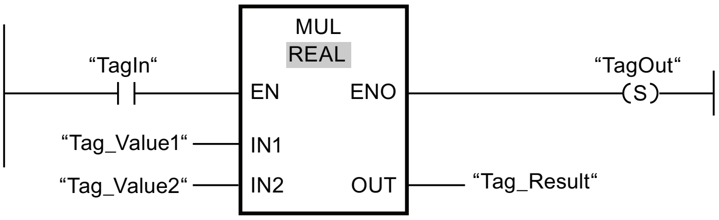
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Multiplier
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Multiplicand
INn	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Optional input values that can be multiplied.
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Product

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



If operand "TagIn" has the signal state "1", the "Multiply" instruction is executed. The value of operand "Tag_Value1" is multiplied by the value of operand "Tag_Value2". The result of the multiplication is stored in operand "Tag_Result". If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

Basics of the EN/ENO mechanism (Page 819)

Inserting additional inputs and outputs in LAD elements (Page 927)

DIV: Divide

Description

You can use the "Divide" instruction to divide the value at the IN1 input by the value at the IN2 input and query the quotient at the OUT output (OUT = IN1/IN2).

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The result of the instruction is outside the range permitted for the data type specified at the OUT output.
- A floating-point number has an invalid value.

Parameters

The following table shows the parameters of the "Divide" instruction:

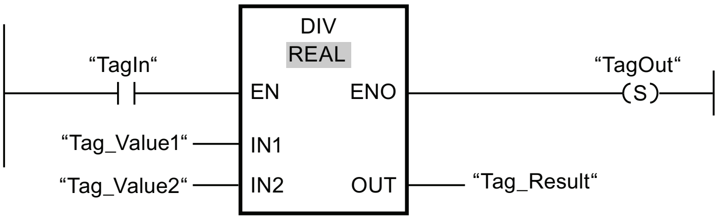
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Dividend
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Divisor
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Quotient value

You can select the data type of the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



If operand "TagIn" has the signal state "1", the "Divide" instruction is executed. The value of operand "Tag_Value1" is divided by the value of operand "Tag_Value2". The division result is stored in operand "Tag_Result". If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

Basics of the EN/ENO mechanism (Page 819)

MOD: Return remainder of division

Description

You can use the "Return remainder of division" instruction to divide the value at the IN1 input by the value at the IN2 input and query the remainder at the OUT output.

The instruction is only executed if the signal state is "1" at the EN input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The instruction is not executed if the signal state at the EN input is "0". In this case, the ENO output is reset.

Parameters

The following table shows the parameters of the "Return remainder of division" instruction:

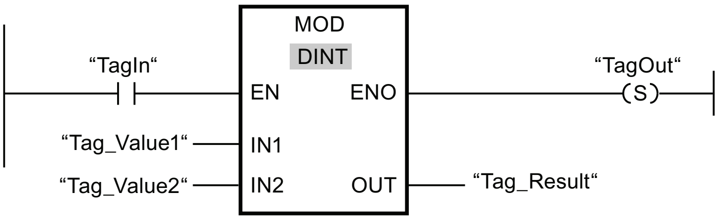
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Integers	I, Q, M, D, L or constant	Dividend
IN2	Input	Integers	I, Q, M, D, L or constant	Divisor
OUT	Output	Integers	I, Q, M, D, L	Remainder of division

You can select the data type of the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



If operand "TagIn" has the signal state "1", the "Return remainder of division" instruction is executed. The value of operand "Tag_Value1" is divided by the value of operand "Tag_Value2". The remainder is stored in operand "Tag_Result". If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

NEG: Create twos complement

Description

You can use the "Create twos complement" instruction to change the sign of the value at the IN input and query the result at the OUT output. If there is a positive value at the IN input, for example, the negative equivalent of this value is sent to the OUT output.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The result of the instruction is outside the range permitted for the data type specified at the OUT output.
- A floating-point number has an invalid value.

Parameters

The following table shows the parameters of the "Create twos complement" instruction:

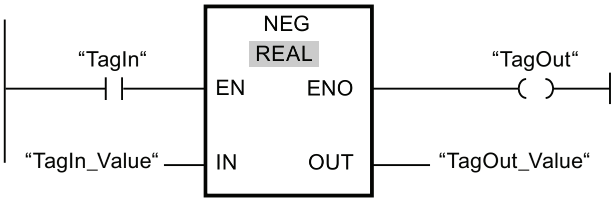
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	SINT, INT, DINT, floating-point numbers	I, Q, M, D, L or constant	Input value
OUT	Output	SINT, INT, DINT, floating-point numbers	I, Q, M, D, L	Twos complement of the input value

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



If operand "TagIn" has the signal state "1", the "Create twos complement" instruction is executed. The sign of the value at the "TagIn_Value" input is changed and the result is provided at the "TagOut_Value" output. If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

INC: Increment

Description

You can use the "Increment" instruction to change the value of the operand at the IN/OUT parameter to the next higher value and query the result. The "Increment" instruction is only started when the signal state at the EN enable input is "1". If no overflow error occurs during the execution, the ENO output also has the signal state "1".

If the signal state is "0" at the EN enable input, the instruction is not executed. In this case, the ENO enable output is reset.

Parameters

The following table shows the parameters of the "Increment" instruction:

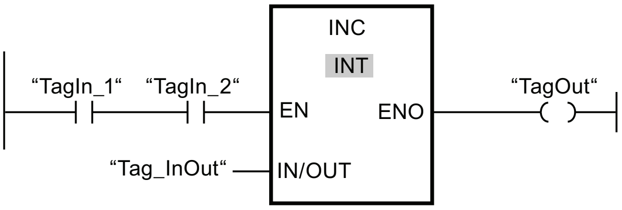
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN/OUT	InOut	Integers	I, Q, M, D, L	Value to be incremented.

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



If operands "TagIn_1" and "TagIn_2" have the signal state "1", the value of operand "Tag_InOut" is incremented by one and the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

DEC: Decrement

Description

You can use the "Decrement" instruction to change the value of the operand at the IN/OUT parameter to the next lower value and query the result. Execution of the "Decrement" instruction is started when the signal state at the EN enable input is "1". If the range of values of the selected data type is not exceeded during processing, the ENO output also has the signal state "1".

If the signal state is "0" at the EN enable input, the instruction is not executed. In this case, the ENO enable output is reset.

Parameters

The following table shows the parameters of the "Decrement" instruction:

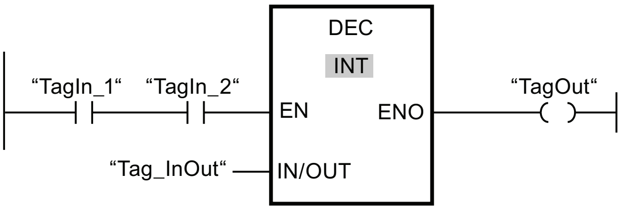
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN/OUT	InOut	Integers	I, Q, M, D, L	Value to be decremented.

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



If operands "TagIn_1" and "TagIn_2" have the signal state "1", the value of operand "Tag_InOut" is decremented by one and the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

ABS: Form absolute value

Description

The "Form absolute value" instruction calculates the absolute value of the value specified at the IN input. The result of the instruction is sent to the OUT output and can be queried there.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- A floating-point number has an invalid value.

Parameters

The following table shows the parameters of the "Form absolute value" instruction:

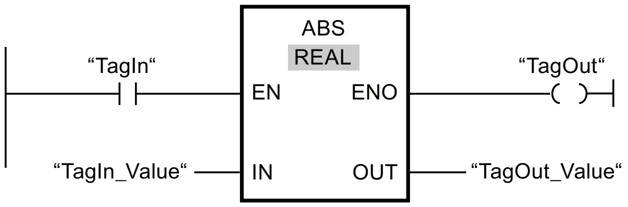
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	SINT, INT, DINT, floating-point numbers	I, Q, M, D, L or constant	Input value
OUT	Output	SINT, INT, DINT, floating-point numbers	I, Q, M, D, L	Absolute value of the input value

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	"TagIn_Value"	- 6, 234
OUT	"TagOut_Value"	6, 234

If operand "TagIn" has the signal state "1", the "Form absolute value" instruction is executed. The instruction calculates the absolute value of the value at the "TagIn_Value" input and sends the result to the "TagOut_Value" output. If the instruction is executed without errors, the "TagOut" output is set.

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

MIN: Get minimum

Description

The "Get minimum" instruction compares the values of the available inputs and writes the lowest value to the OUT output. The number of inputs can be expanded in the instruction box by additional inputs. The inputs are numbered in ascending order in the box.

A minimum of two and a maximum of 100 inputs must be specified for the execution of the instruction.

Execution of the instruction presupposes that the tags at all inputs are of the same type and that enable input EN has signal state "1". If the instruction is executed without errors, the ENO enable output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The specified tags are not of the same data type.
- A floating-point number has an invalid value.

Parameters

The following table shows the parameters of the "Get minimum" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	First input value
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Second input value

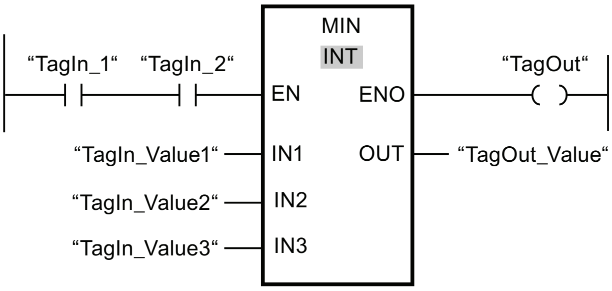
Parameters	Declaration	Data type	Memory area	Description
INn	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Additionally inserted inputs whose values are to be compared.
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Result

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN1	TagIn_Value1	12 222
IN2	TagIn_Value2	14 444
IN3	TagIn_Value3	13 333
OUT	TagOut_Value	12 222

If operands "TagIn_1" and "TagIn_2" have the signal state "1", the "Get minimum" instruction is executed. The instruction compares the values of the specified operands and copies the lowest value ("TagIn_Value1") to the "TagOut_Value" output. If the instruction is executed without errors, the "TagOut" output is set.

Basics of the EN/ENO mechanism (Page 819)

MAX: Get maximum

Description

The "Get maximum" instruction compares the values of the available inputs and writes the highest value to the OUT output. The number of inputs can be expanded in the instruction box by additional inputs. The inputs are numbered in ascending order in the box.

A minimum of two and a maximum of 100 inputs must be specified for the execution of the instruction.

Execution of the instruction presupposes that the tags at all inputs are of the same type and that enable input EN has signal state "1". If the instruction is executed without errors, the ENO enable output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The specified tags are not of the same data type.
- A floating-point number has an invalid value.

Parameters

The following table shows the parameters of the "Get maximum" instruction:

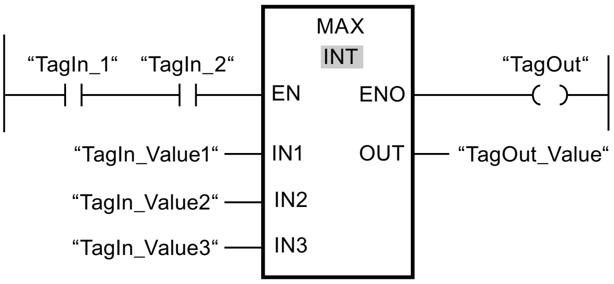
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	First input value
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Second input value
INn	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Additionally inserted inputs whose values are to be compared.
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Result

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN1	TagIn_Value1	12 222
IN2	TagIn_Value2	14 444
IN3	TagIn_Value3	13 333
OUT	TagOut_Value	14 444

If operands "TagIn_1" and "TagIn_2" have the signal state "1", the "Get maximum" instruction is executed. The instruction compares the values of the specified operands and copies the highest value ("TagIn_Value2") to the "TagOut_Value" output. If the instruction is executed without errors, the "TagOut" output is set.

Removing inputs and outputs (Page 928)

Basics of the EN/ENO mechanism (Page 819)

LIMIT: Set limit value

Description

The "Set limit value" instruction limits the value at the IN input to the values at the MN and MX inputs. If the value at the IN input meets the MN < IN < MX condition, it is copied to the OUT output. If the condition is not fulfilled and the input value IN is below the low limit MN, the output OUT is set to the value of the MN input. If the high limit is exceeded, the MX output OUT is set to the value of the MX input.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO enable output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The specified tags are not of the same data type.
- An operand has an invalid value.
- The value at the MN input is greater than the value at the MX input.

Parameters

The following table shows the parameters of the "Set limit value" instruction:

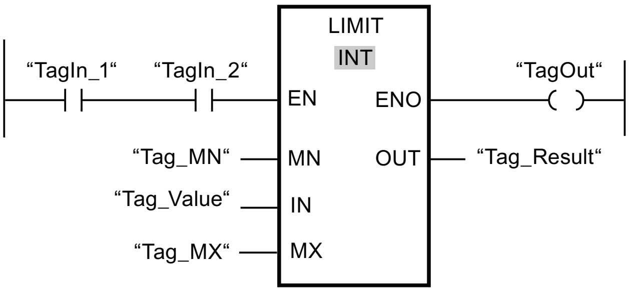
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
MN	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Low limit
IN	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Input value
MX	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	High limit
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Result

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
MN	Tag_MN	12 000
IN	Tag_Value	8 000
MX	Tag_MX	16 000
OUT	Tag_Result	12 000

If operands "TagIn_1" and "TagIn_2" have the signal state "1", the "Set limit value" instruction is executed. The value of operand "Tag_Value" is compared with the values of operands "Tag_MN" and "Tag_MX". Since the value of operand "Tag_Value" is less than the low limit, the value of operand "Tag_MN" is copied to the "Tag_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

Basics of the EN/ENO mechanism (Page 819)

SQR: Form square

Description

You can use the "Form square" instruction to square the value at the IN input and query the result at the OUT output.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The value at the IN input is not a valid floating-point number.

Parameters

The following table shows the parameters of the "Form square" instruction:

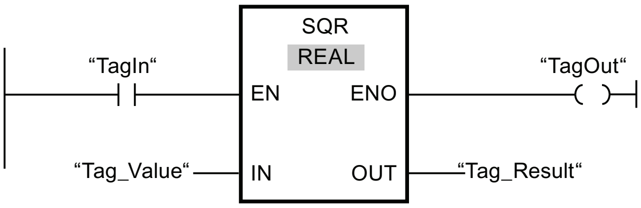
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Input value
OUT	Output	Floating-point numbers	I, Q, M, D, L	Square of the input value

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	5.0
OUT	Tag_Result	25.0

If operand "TagIn" has the signal state "1", the "Form square" instruction is executed. The instruction squares the value of operand "Tag_Value" and sends the result to the "Tag_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

SQRT: Form square root

Description

You can use the "Form square root" instruction to find the square root of the value at the IN input and query the result at the OUT output. The instruction outputs a positive result if the input value is greater than zero. If input values are less than zero, the OUT output returns an invalid floating-point number. If the value at input IN is "0", then the result is also "0".

The instruction is only executed if the signal state is "1" at the enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The value at the IN input is not a valid floating-point number.
- The value at the IN input is negative.

Parameters

The following table shows the parameters of the "Form square root" instruction:

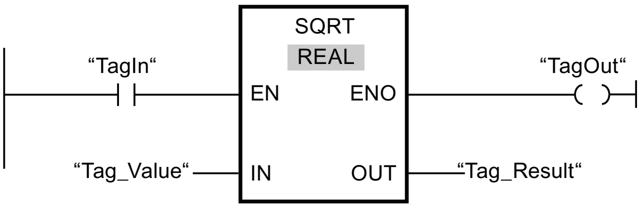
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Input value
OUT	Output	Floating-point numbers	I, Q, M, D, L	Square root of the input value

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	25.0
OUT	Tag_Result	5.0

If operand "TagIn" has the signal state "1", the "Form square root" instruction is executed. The instruction finds the square root of the value of operand "Tag_Value" and stores the result in the "Tag_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

LN: Form natural logarithm

Description

The "Form natural logarithm" instruction calculates the natural logarithm to base e (e = 2.718282e+00) of the value at input IN. The result is sent to the OUT output and can be queried there. The instruction outputs a positive result if the input value is greater than zero. If input values are less than zero, the OUT output returns an invalid floating-point number.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is processed without errors, the ENO enable output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The value at the IN input is not a valid floating-point number.
- The value at the IN input is negative.

Parameters

The following table shows the parameters of the "Form natural logarithm" instruction:

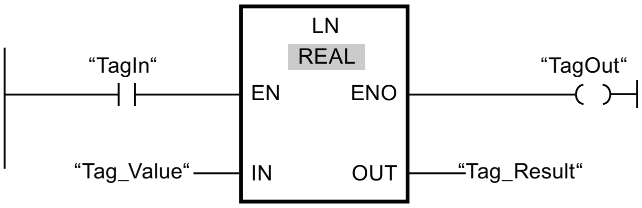
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Input value
OUT	Output	Floating-point numbers	I, Q, M, D, L	Natural logarithm of the input value

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



If operand "TagIn" has the signal state "1", the "Form natural logarithm" instruction is executed. The instruction forms the natural logarithm of the value at the "Tag_Value" input and stores the result in the "Tag_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

EXP: Form exponential value

Description

The "Form exponential value" instruction calculates the exponent from the base e (e = 2.718282e+00) and the value specified at the IN input. The result is sent to the OUT output and can be queried there (OUT = e^{IN}).

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The value at the IN input is not a valid floating-point number.

Parameters

The following table shows the parameters of the "Form exponential value" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output

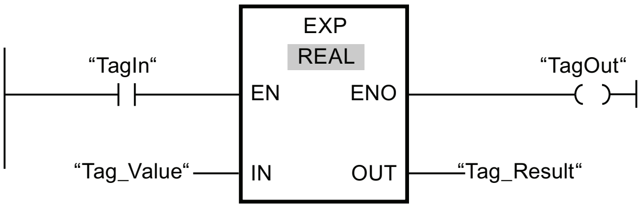
Parameters	Declaration	Data type	Memory area	Description
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Input value
OUT	Output	Floating-point numbers	I, Q, M, D, L	Exponential value of input value IN

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



If operand "TagIn" has the signal state"1", the "Form exponential value" instruction is executed. The instruction calculates the exponent from base e and the value of operand "Tag_Value" and sends the result to the "Tag_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

SIN: Form sine value

Description

Use the "Form sine value" instruction to calculate the sine of the angle. The size of the angle is specified in radians at the input IN. The result of the instruction is sent to the OUT output and can be queried there.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The value at the IN input is not a valid floating-point number.

Parameters

The following table shows the parameters of the "Form sine value" instruction:

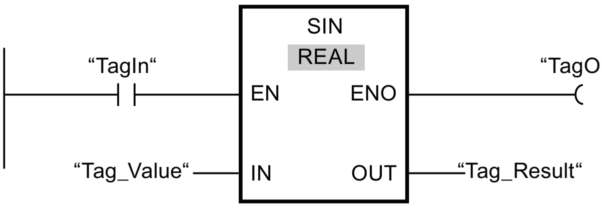
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Size of angle in radians
OUT	Output	Floating-point numbers	I, Q, M, D, L	Sine of the specified angle

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	+1.570796e+00 (π/2)
OUT	Tag_Result	1.0

If operand "TagIn" has the signal state "1", the "Form sine value" instruction is executed. The instruction calculates the sine of the angle specified at the "Tag_Value" input and stores the result in the "Tag_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

COS: Form cosine value

Description

You can use the "Form cosine value" instruction to calculate the cosine of an angle. The size of the angle is specified in radians at the IN input. The result of the instruction is sent to the OUT output and can be queried there.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The value at the IN input is not a valid floating-point number.

Parameters

The following table shows the parameters of the "Form cosine value" instruction:

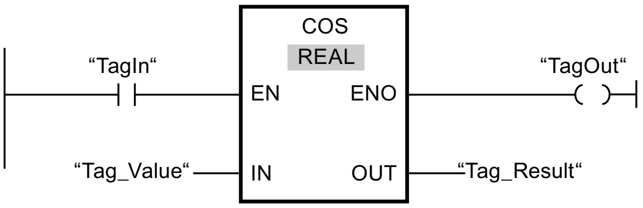
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Size of angle in radians
OUT	Output	Floating-point numbers	I, Q, M, D, L	Cosine of the specified angle

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	+1.570796e+00 (π/2)
OUT	Tag_Result	0

If operand "TagIn" has the signal state "1", the "Form cosine value" instruction is executed. The instruction calculates the cosine of the angle specified at the "Tag_Value" input and stores the result in the "Tag_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

TAN: Form tangent value

Description

The "Form tangent value" instruction calculates the tangent of an angle. The size of the angle is specified in radians at the IN input. The result of the instruction is sent to the OUT output and can be queried there.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The value at the IN input is not a valid floating-point number.

Parameters

The following table shows the parameters of the "Form tangent value" instruction:

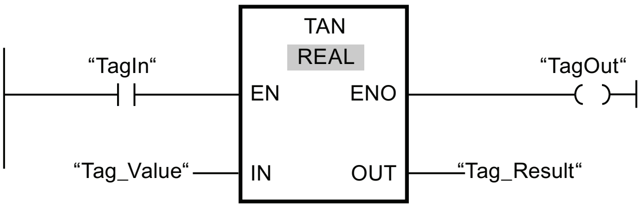
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Size of angle in radians
OUT	Output	Floating-point numbers	I, Q, M, D, L	Tangent of the specified angle

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	+3.141593e+00 (π)
OUT	Tag_Result	0

If operand "TagIn" has the signal state "1", the "Form tangent value" instruction is executed. The instruction calculates the tangent of the angle specified at the "Tag_Value" input and stores the result in the "Tag_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

ASIN: Form arcsine value

Description

The "Form arcsine value" instruction calculates the size of the angle corresponding to the sine value specified at the IN input. Only valid floating-point numbers within the range -1 to +1 can be specified at the IN input. The calculated angle size is output in radians at the OUT output and can range in value from -π/2 to +π/2.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The value at the IN input is not a valid floating-point number.
- The value at the IN input is outside the permitted value range (-1 to +1).

Parameters

The following table shows the parameters of the "Form arcsine value" instruction:

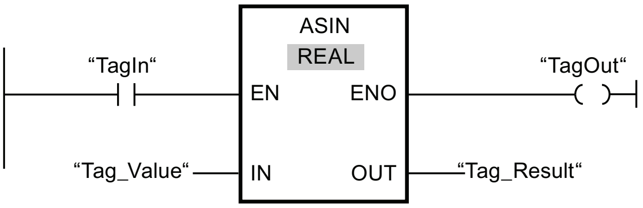
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Sine value
OUT	Output	Floating-point numbers	I, Q, M, D, L	Size of angle in radians

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	1.0
OUT	Tag_Result	+1.570796e+00 (π/2)

If operand "TagIn" has the signal state "1", the "Form arcsine value" instruction is executed. The instruction calculates the size of the angle corresponding to the sine value at the "Tag_Value" input. The result of the instruction is stored in the "Tag_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

ACOS: Form arccosine value

Description

The "Form arccosine value" instruction calculates the size of the angle corresponding to the cosine value specified at the IN input. Only valid floating-point numbers within the range -1 to +1 can be specified at the IN input. The calculated angle size is output in radians at the OUT output and can range in value from 0 to +π.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The value at the IN input is not a valid floating-point number.
- The value at the IN input is outside the permitted value range (-1 to +1).

Parameters

The following table shows the parameters of the "Form arccosine value" instruction:

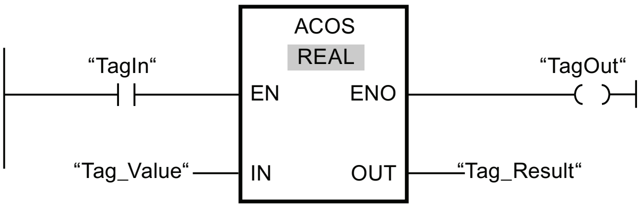
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Cosine value
OUT	Output	Floating-point numbers	I, Q, M, D, L	Size of angle in radians

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	0
OUT	Tag_Result	+1.570796e+00 (π/2)

If operand "TagIn" has the signal state "1", the "Form arccosine value" instruction is executed. The instruction calculates the size of the angle corresponding to the cosine value at the "Tag_Value" input. The result of the instruction is stored in the "Tag_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

Basics of the EN/ENO mechanism (Page 819)

ATAN: Form arctangent value

Description

The "Form arctangent value" instruction calculates the size of the angle corresponding to the tangent value specified at the IN input. Only valid floating-point numbers may be specified at the IN input. The calculated angle size is output in radians at the OUT output and can range in value from -π/2 to +π/2.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The value at the IN input is not a valid floating-point number.

Parameters

The following table shows the parameters of the "Form arctangent value" instruction:

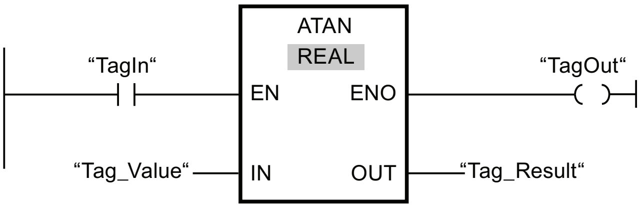
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Tangent value
OUT	Output	Floating-point numbers	I, Q, M, D, L	Size of angle in radians

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	1.0
OUT	Tag_Result	+0.785398e+00 (π/4)

If operand "TagIn" has the signal state"1", the "Form arctangent value" instruction is executed. The instruction calculates the size of the angle corresponding to the tangent value at the "Tag_Value" input. The result of the instruction is stored in the "Tag_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

FRAC: Return fraction

Description

You can use the "Return fraction" instruction to determine the decimal places of the value at the IN input. The result of the query is stored at the OUT output and can be queried there. If the value at the IN input is 123.4567, for example, the OUT output returns the value 0.4567. The instruction is started when the EN input has the signal state "1". In this case, the ENO enable output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- Errors occur during execution of the instruction, for example, there is no valid floating-point number at the IN input.

Parameters

The following table shows the parameters of the "Return fraction" instruction:

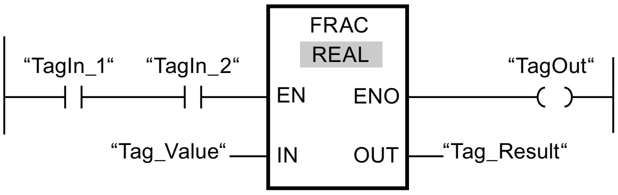
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Value, whose decimal places are to be determined.
OUT	Output	Floating-point numbers	I, Q, M, D, L	Decimal places of the value at the IN input

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	2,555
OUT	Tag_Result	0,555

If operands "TagIn_1" and "TagIn_2" have the signal state "1", the "Return fraction" instruction is started. The decimal places from the value of operand "Tag_Value" are copied to operand "Tag_Result". If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

EXPT: Exponentiate

Description

You can use the "Exponentiate" instruction to raise the value at the IN1 input to a power specified with the value at the IN2 input. The result of the instruction is stored in the OUT output and can be queried there (OUT = $IN1^{IN2}$).

The IN1 input can only be assigned valid floating-point numbers. Integers can also be assigned to the IN2 input.

The "Exponentiate" instruction can only be executed when the signal state at the EN enable input is "1". In this case, the ENO enable output has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- Errors occur during execution of the instruction, for example, an overflow occurs.

Parameters

The following table shows the parameters of the "Exponentiate" instruction:

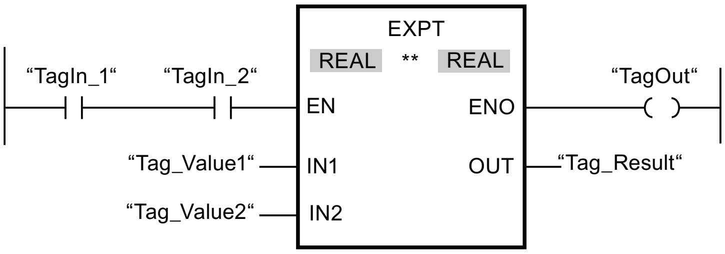
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Floating-point numbers	I, Q, M, D, L or constant	Base value
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Value with which the base value is exponentiated
OUT	Output	Floating-point numbers	I, Q, M, D, L	Result

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



If operands "TagIn_1" and "TagIn_2" have the signal state "1", the "Exponentiate" instruction is started. The value of operand "Tag_Value1" is raised to a power specified with the value of operand "Tag_Value2". The result is stored in the "Tag_Result" output. If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

Basics of the EN/ENO mechanism (Page 819)

Move operations

MOVE: Move value

Description

You use the "Move value" instruction to transfer the contents of the operand at the IN input to the operand at the OUT1 output. The transfer is always made in the direction of the ascending address.

The following table shows the possible transfers:

Source (IN)	Destination (OUT1)	
	With IEC check	Without IEC check
BYTE	BYTE, WORD, DWORD	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE ,TOD, CHAR
WORD	WORD, DWORD	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD, CHAR
DWORD	DWORD	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, REAL, TIME, DATE, TOD, CHAR
SINT	SINT	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD
USINT	USINT, UINT, UDINT	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD

Source (IN)	Destination (OUT1)	
	With IEC check	Without IEC check
INT	INT	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD
UINT	UINT, UDINT	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD
DINT	DINT	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD
UDINT	UDINT	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD
REAL	REAL	DWORD, REAL
LREAL	LREAL	LREAL
TIME	TIME	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME
DATE	DATE	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, DATE
TOD	TOD	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TOD
DTL	DTL	DTL
CHAR	CHAR	BYTE, WORD, DWORD, characters of a string1)
Characters of a string1)	Characters of a string	CHAR, characters of a string
ARRAY2)	ARRAY	ARRAY
STRUCT	STRUCT	STRUCT

1) You can also use the "Move value" instruction to transfer individual characters of a string (STRING) to operands of data type CHAR. The number of the character to be transferred is given in brackets next to the operand name. "MyString[2]", for example, transfers the second character of the "MyString" string. You can also transfer an operand with the CHAR data type to individual characters of a string. You can also replace a specific character of a string with the character of another string.

2) The transfer of whole arrays is only possible if the data type of the array components of the operand at the IN input matches that of the operand at the OUT1 output.

If the bit length of the data type at the IN input exceeds the bit length of the data type at the OUT1 output, the more significant bits of the source value are lost. If the bit length of the data type at the IN input is less than the bit length of the data type at the OUT1 output, then the more significant bits of the destination value will be overwritten with zeros.

In its initial state, the instruction box contains 1 output (OUT1). The number of outputs can be extended. The added outputs are numbered in ascending order on the box. When the instruction is executed, the content of the operand at the IN input is sent to all available outputs. The instruction box cannot be extended if structured data types (DTL, STRUCT, ARRAY) or characters of a string (STRING) are transferred.

The instruction is only executed if the signal state is "1" at the EN enable input. In this case, the ENO output also has the signal state "1".

If the signal state at the EN input is "0", the ENO enable output is reset to "0".

The "Move block" (MOVE_BLK) and "Move block uninterruptible" (UMOVE_BLK) instructions can also be used to copy operands of the ARRAY data type. Operands of the STRING data type can be copied using the S_MOVE instruction.

Parameters

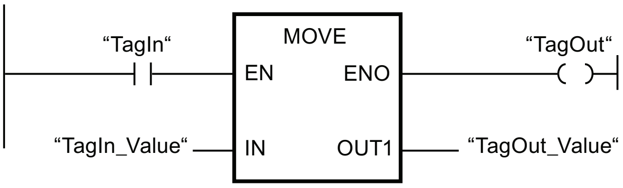
The following table shows the parameters of the "Move value" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers, floating-point numbers, timers, DATE, TIME, TOD, DTL, CHAR, STRUCT, ARRAY	I, Q, M, D, L or constant	Source value
OUT1	Output	Bit strings, integers, floating-point numbers, timers, DATE, TIME, TOD, DTL, CHAR, STRUCT, ARRAY	I, Q, M, D, L	Operands to which in the source value is transferred.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
OUT1	TagOut_Value	0011 1111 1010 1111

If operand "TagIn" has the signal state"1", the "Move value" instruction is executed. The instruction copies the contents of operand "TagIn_Value" to operand "TagOut_Value" and sets output "TagOut" to signal state "1".

FieldRead: Read field

Description

You can use the "Read field" instruction to read out a specific component from the field specified in the MEMBER parameter and transfer its content to the tag in the VALUE parameter. You specify the index of the field component to be read in the INDEX parameter. Specify the first component of the field from which reading is to occur in the MEMBER parameter.

The data type of the field component in the MEMBER parameter and the data type of the tags in the VALUE parameter must match the data type of the "Read field" instruction.

The execution of the "Read field" instruction is only started when the signal state at the EN enable input is "1". If no errors occur during execution, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The field component specified in the INDEX parameter is not defined in the field specified in the MEMBER parameter.
- Errors such as an overflow occur during execution.

Parameters

The following table shows the parameters of the "Read field" instruction:

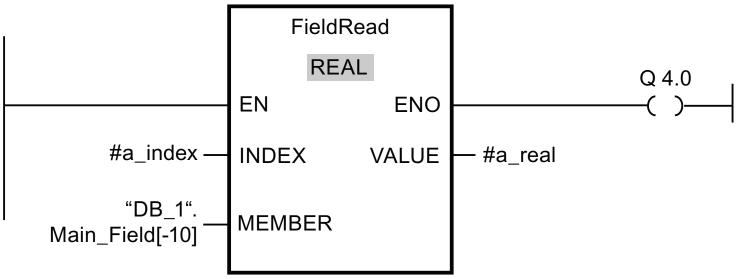
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
INDEX	Input	DINT	I, Q, M, D, L or constant	Index of field component whose content is read out
MEMBER	Input	BOOL, bit strings, integers, floating-point numbers, timers, DATE and CHAR as a component of an ARRAY tag	I, Q, M, D, L	First component of the field from which reading occurs
VALUE	Output	BOOL. bit strings, integers, floating-point numbers, timers, DATE and CHAR	I, Q, M, D, L	Operand to which the content of the field component is transferred

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Tag	Value
INDEX	a_index	4
MEMBER	"DB_1".Main_Field[-10]	First component of the "Main_Field[-10..10] of REAL" field in the "DB_1" data block
VALUE	a_real	Component with index 4 of the "Main_Field[-10..10] of REAL" field

The field component with index 4 is read from the "Main_Field[-10...10] of REAL" field and written to the "a_real" tag. The field component to be read is specified by the value at the INDEX parameter.

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

FieldWrite: Write field

Description

You can use the "Write field" instruction to transfer the content of the tag in the VALUE parameter to a specific component of the field in the MEMBER parameter. You specify the index of the field component that is being written to by the value in the INDEX parameter. At the MEMBER parameter, specify the first component of the field which is to be written to.

The data type of the field component specified in the MEMBER parameter and the data type of the tag in the VALUE parameter must match the data type of the "Write field" instruction.

The execution of the "Write field" instruction is only started when the signal state at the EN enable input is "1". If no errors occur during execution, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The field component specified in the INDEX parameter is not defined in the field specified in the MEMBER parameter.
- Errors such as an overflow occur during execution.

Parameters

The following table shows the parameters of the "Write field" instruction:

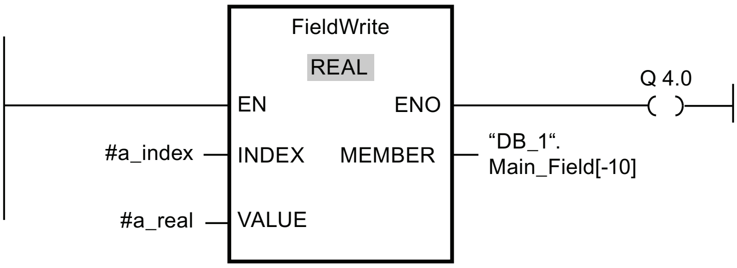
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
INDEX	Input	DINT	I, Q, M, D, L or constant	Index of the field component that is being written with the content of VALUE
VALUE	Input	BOOL. bit strings, integers, floating-point numbers, timers, DATE and CHAR	I, Q, M, D, L or constant	Operand whose content is copied
MEMBER	Output	BOOL, bit strings, integers, floating-point numbers, timers, DATE and CHAR as a component of an ARRAY tag	I, Q, M, D, L	First component of the field to which the content of VALUE is written

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
INDEX	a_index	4
VALUE	a_real	10,54
MEMBER	"DB_1".Main_Field[-10]	First component of the "Main_Field[-10..10] of REAL" field in the "DB_1" data block

The value "10,54" of the "a_real" tag is written to the field component with index 4 of the "Main_Field[-10..10] of REAL" field. The index of the field component to which the content of the "a_real" tag is transferred" is specified by the value in the INDEX parameter.

Basics of the EN/ENO mechanism (Page 819)

MOVE_BLK: Move block

Description

You can use the "Move block" instruction to move the contents of a memory area (source area) to another memory area (destination area). The number of elements to be copied to the destination area is specified with the COUNT parameter. The width of the elements to be copied is defined by the width of the element at the IN input. The copy operation takes place in the direction of ascending addresses.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- More data is copied than is made available at the IN input or OUT output.

If the last BOOL element of an ARRAY structure is not at a byte limit (for example, bit 16 of 2 bytes) and an overflow occurs, the ENO output remains at "1" until the byte limit of the ARRAY structure is exceeded. If the byte limit of the ARRAY structure is exceeded by the value at the COUNT input, the ENO output is reset to "0".

Parameters

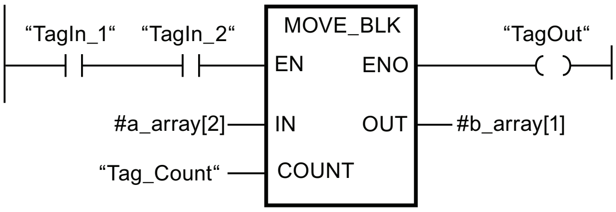
The following table shows the parameters of the "Move block" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Binary numbers, integers, floating-point numbers, timers, DATE and CHAR as a component of an ARRAY structure	D, L	The first element of the source area that is being copied from.
COUNT	Input	UINT	I, Q, M, D, L or constant	Number of elements to be copied from the source area to the destination area.
OUT	Output	Binary numbers, integers, floating-point numbers, timers, DATE and CHAR as a component of an ARRAY structure	D, L	The first element of the destination area to which the contents of the source area are being copied.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	a_array[2]	Operand "a_array" has ARRAY data type and consists of 5 elements of the INT data type.
COUNT	Tag_Count	3
OUT	b_array[1]	Operand "b_array" has ARRAY data type and consists of 6 elements of the INT data type.

If operands "TagIn_1" and "TagIn_2" have the signal state "1", the "Move block" instruction is executed. The instruction selects three INT elements from the "a_array" (a_array[2..4]) tag and copies their contents into the "b_array" (b_array[1..3]) output tag. If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

Inserting additional inputs and outputs in LAD elements (Page 927)

UMOVE_BLK: Move block uninterruptible

Description

You can use the "Move block uninterruptible" instruction to copy the contents of a memory area (source area) to another memory area (destination area) without interruption. The number of elements to be copied to the destination area is specified with the COUNT parameter. The width of the elements to be copied is defined by the width of the element at the IN input. The content of the source area is copied to the destination area in the direction of the ascending address.

Note

The copy operation cannot be interrupted by other operating system activities. This is why the alarm reaction times of the CPU increase during the execution of the "Move block uninterruptible" instruction.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- More data is copied than is made available at the IN input or OUT output.

If the last BOOL element of an ARRAY structure is not at a byte limit (for example, bit 16 of 2 bytes) and an overflow occurs, the ENO output remains at "1" until the byte limit of the ARRAY structure is exceeded. If the byte limit of the ARRAY structure is exceeded by the value at the COUNT input, the ENO output is reset to "0".

Parameters

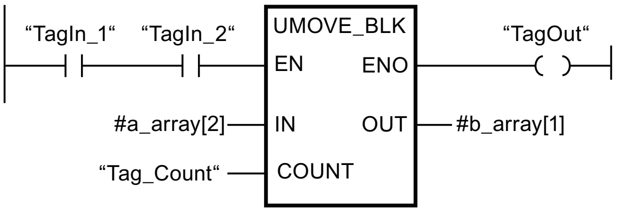
The following table shows the parameters of the "Move block uninterruptible" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Binary numbers, integers, floating-point numbers, timers, DATE and CHAR as a component of an ARRAY structure	D, L	The first element of the source area that is being copied from.
COUNT	Input	UINT	I, Q, M, D, L or constant	Number of elements to be copied from the source area to the destination area.
OUT	Output	Binary numbers, integers, floating-point numbers, timers, DATE and CHAR as a component of an ARRAY structure	D, L	The first element of the destination area to which the contents of the source area are being copied.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	a_array[2]	Operand "a_array" has ARRAY data type and consists of 5 elements of the INT data type.
COUNT	Tag_Count	3
OUT	b_array[1]	The b_array tag has ARRAY data type and consists of 6 elements of the INT data type.

If operands "TagIn_1" and "TagIn_2" have the signal state "1", the "Move block uninterruptible" instruction is executed. The instruction selects three INT elements from the "a_array" (a_array[2..4]) tag and copies their contents into the "b_array" (b_array[1..3]) output tag. The copy operation cannot be interrupted by other operating system activities. If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

Inserting additional inputs and outputs in LAD elements (Page 927)

FILL_BLK: Fill block

Description

You can use the "Fill block" instruction to fill a memory area (destination area) with the value of the IN input. The destination area is filled starting from the address specified at the OUT output. The number of repeated copy operations is specified with the COUNT parameter. When the instruction is executed, the value at the IN input is selected and copied to the destination area as often as specified by the value in the COUNT parameter.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- More data is copied than is made available at the IN input or OUT output.

If the last BOOL element of an ARRAY structure is not at a byte limit (for example, bit 16 of 2 bytes) and an overflow occurs, the ENO output remains at "1" until the byte limit of the ARRAY structure is exceeded. If the byte limit of the ARRAY structure is exceeded by the value at the COUNT input, the ENO output is reset to "0".

Parameters

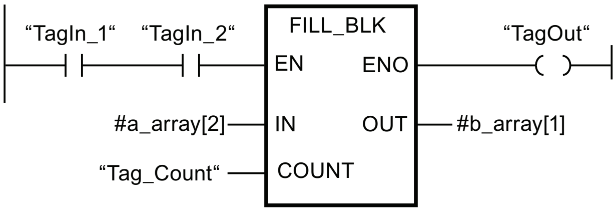
The following table shows the parameters of the "Fill block" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Binary numbers, integers, floating-point numbers, timers, DATE and CHAR as a component of an ARRAY structure	D, L or constant	Element used to fill the destination area.
COUNT	Input	UINT	I, Q, M, D, L or constant	Number of repeated copy operations
OUT	Output	Binary numbers, integers, floating-point numbers, timers, DATE and CHAR as a component of an ARRAY structure	D, L	Address in destination area from which filling starts.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	A_array[2]	Operand "a_array" has ARRAY data type and consists of 4 elements of the WORD data type (ARRAY[1..4] of WORD).
COUNT	Tag_Count	3
OUT	b_array[1]	Operand "b_array" has ARRAY data type and consists of 5 elements of the WORD data type (ARRAY[1..5] of WORD).

If operands "TagIn_1" and "TagIn_2" have the signal state "1", the "Fill block" instruction is executed. The instruction copies the second element (a_array[2]) of the "a_array" tag three times to the "b_array" output tag (b_array[1..3]). If the instruction is executed without errors, the ENO and "TagOut" outputs are set to signal state "1".

UFILL_BLK: Fill block uninterruptible

Description

You can use the "Fill block uninterruptible" instruction to fill a memory area (destination area) with the value of the IN input without interruption. The destination area is filled starting from the address specified at the OUT output. The number of repeated copy operations is specified with the COUNT parameter. When the instruction is executed, the value at the IN input is selected and copied to the destination area as often as specified by the value in the COUNT parameter.

Note

The copy operation cannot be interrupted by other operating system activities. This is why the alarm reaction times of the CPU increase during the execution of the "Fill block uninterruptible" instruction.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- More data is copied than is made available at the IN input or OUT output.

If the last BOOL element of an ARRAY structure is not at a byte limit (for example, bit 16 of 2 bytes) and an overflow occurs, the ENO output remains at "1" until the byte limit of the ARRAY structure is exceeded. If the byte limit of the ARRAY structure is exceeded by the value at the COUNT input, the ENO output is reset to "0".

Parameters

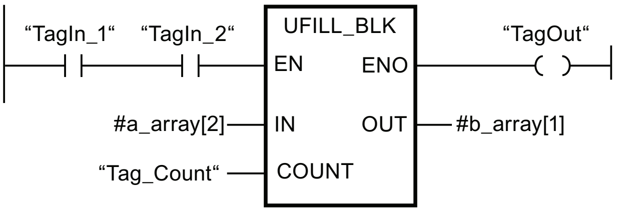
The following table shows the parameters of the "Fill block uninterruptible" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Binary numbers, integers, floating-point numbers, timers, DATE and CHAR as a component of an ARRAY structure	D, L or constant	Element used to fill the destination area.
COUNT	Input	UINT	I, Q, M, D, L or constant	Number of repeated copy operations
OUT	Output	Binary numbers, integers, floating-point numbers, timers, DATE and CHAR as a component of an ARRAY structure	D, L	Address in destination area from which filling starts.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	a_array[2]	Operand "a_array" has ARRAY data type and consists of 4 elements of the WORD data type (ARRAY[1..4] of WORD).
COUNT	Tag_Count	3
OUT	b_array[1]	Operand "b_array" has ARRAY data type and consists of 5 elements of the WORD data type (ARRAY[1..5] of WORD).

If operands "TagIn_1" and "TagIn_2" have the signal state "1", the "Fill block uninterruptible" instruction is executed. The instruction copies the second element (a_array[2]) of the "a_array" tag three times to "b_array" (b_array[1..3]) output tag. The copy operation cannot be interrupted by other operating system activities. If the instruction is executed without errors, the ENO and "TagOut" outputs are set to signal state "1".

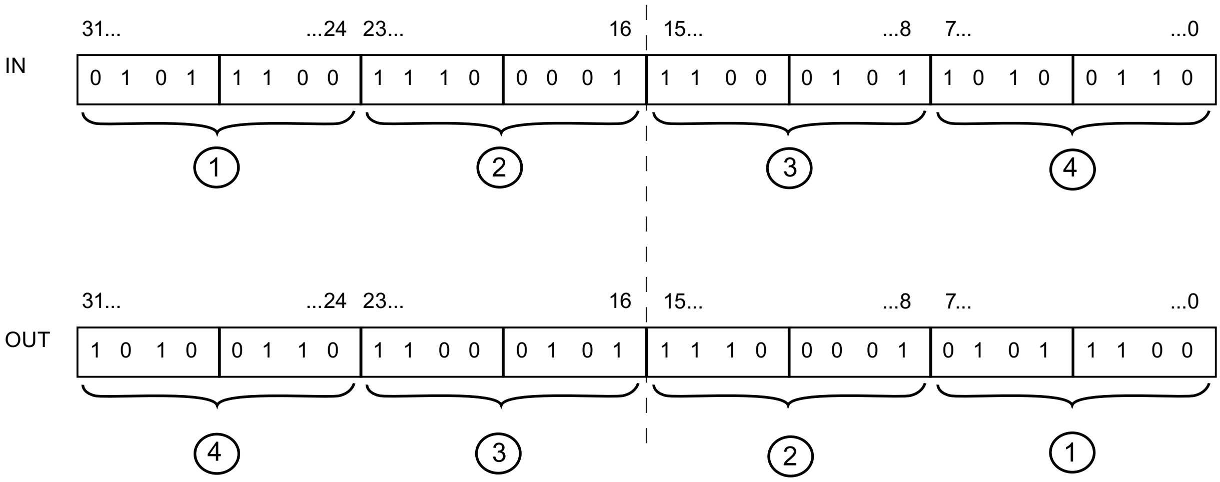
SWAP: Swap

Description

The "Swap" instruction changes the order of the bytes at the IN input and queries the result at the OUT output.

The following figure shows how the bytes of an operand of the DWORD data type are swapped using the "Swap" instruction:



The "Swap" instruction can only be executed when the signal state at the EN enable input is "1". In this case, the ENO enable output has the signal state "1".

The ENO enable output is reset when the EN enable input has the signal state "0" or errors occur during execution of the instruction.

Parameters

The following table shows the parameters of the "Swap" instruction:

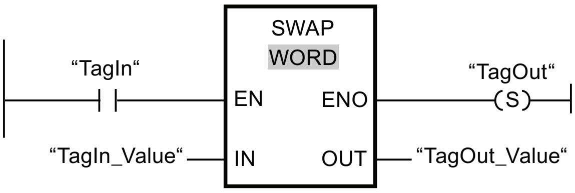
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	WORD, DWORD	I, Q, M, D, L or constant	Operand whose bytes are swapped.
OUT	Output	WORD, DWORD	I, Q, M, D, L	Result

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	TagIn_Value	0000 1111 0101 0101
OUT	TagOut_Value	0101 0101 1111 0000

If operand "TagIn" has the signal state "1", the "Swap" instruction is executed. The order of the bytes is changed and stored in operand "TagOut_Value". If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

Conversion operations

CONVERT: Convert value

Description

The "Convert value" instruction reads the content of the IN parameter and converts it according to the data types selected in the instruction box. The converted value is sent to the OUT output.

For information on the possible conversions, refer to the "Auto-Hotspot" section.

The execution of the "Convert value" instruction is only started when the signal state at the EN enable input is "1". If no errors occur during execution, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- Errors such as an overflow occur during execution.
- An operand of data type BYTE, WORD, or DWORD is specified at the IN input. This operand's most significant bit is set. A signed integer (SINT, INT, DINT) is specified at the OUT output. It has the same bit length as the operand at the IN input.

Parameters

The following table shows the parameters of the "Convert value" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers, floating-point numbers, CHAR, BCD16, BCD32	I, Q, M, D, L or constant	Value to be converted.
OUT	Output	Bit strings, integers, floating-point numbers, CHAR, BCD16, BCD32	I, Q, M, D, L	Result of the conversion

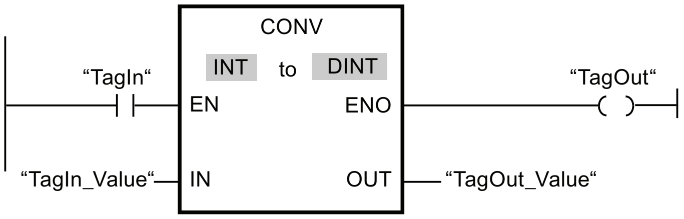
You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

Bit strings (BYTE, WORD, DWORD) cannot be selected in the instruction box. If you enter an operand of data type BYTE, WORD, or DWORD for a parameter of the instruction, the value of the operand is interpreted as an unsigned integer with the same bit length. In this case, data type BYTE is interpreted as USINT, WORD as UINT, and DWORD as UDINT.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



If operand "TagIn" has the signal state "1", the content of operand "TagIn_Value" is read and converted to an integer (32-bit). The result is stored in operand "TagOut_Value". The "TagOut" output is set to "1" if the instruction is executed without errors.

Explicit conversion of CHAR (Page 816)

Explicit conversion (Page 799)

ROUND: Round numerical value

Description

The "Round numerical value" instruction rounds the value at the IN input to the nearest integer. The instruction interprets the value at input IN as a floating-point number and converts this to an integer of data type DINT. If the input value is exactly between an even and odd number, the even number is selected. The result of the instruction is sent to the OUT output and can be queried there.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is processed without errors, the ENO enable output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- Errors such as an overflow occur during execution.

Parameters

The following table shows the parameters of the "Round numerical value" instruction:

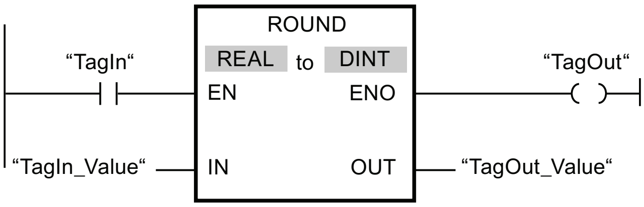
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Input value to be rounded.
OUT	Output	DINT	I, Q, M, D, L	Result of rounding

You can select the data type of the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value	
IN	TagIn_Value	0.50000000	-0.50000000
OUT	TagOut_Value	0	0

If operand "TagIn" has the signal state "1", the "Round numerical value" instruction is executed. The floating-point number at input "TagIn_Value" is rounded to the nearest even integer and sent to output "TagOut_Value". If the instruction is executed without errors, the "TagOut" output is set.

Overview of the valid data types (Page 741)

CEIL: Generate next higher integer from floating-point number

Description

The "Generate next higher integer from floating-point number" instruction rounds the value at the IN input to the next higher integer. The instruction interprets the value at the IN input as a floating-point number and converts this number to the next higher integer. The result of the instruction is sent to the OUT output and can be queried there. The output value can be greater than or equal to the input value.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is processed without errors, the ENO enable output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- Errors such as an overflow occur during execution.

Parameters

The following table shows the parameters of the "Generate next higher integer from floating-point number" instruction:

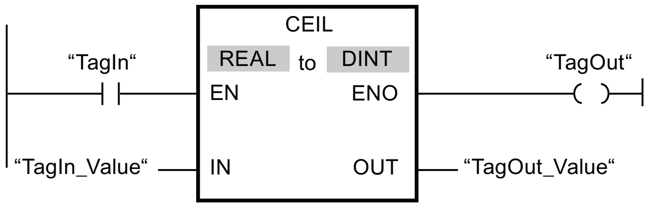
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Input value
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Result with next higher integer

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value	
IN	TagIn_Value	0.50000000	-0.50000000
OUT	TagOut_Value	1	0

If operand "TagIn" has the signal state "1", the "Generate next higher integer from floating-point number" instruction is executed. The floating-point number at the "TagIn_Value" input is rounded to the next higher integer and sent to the "TagOut_Value" output. If the instruction is executed without errors, the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

FLOOR: Generate next lower integer from floating-point number

Description

The "Generate next lower integer from floating-point number" instruction rounds the value at the IN input to the next lower integer. The instruction interprets the value at input IN as a floating-point number and converts this to the next lower integer. The result of the instruction is sent to the OUT output and can be queried there. The output value can be less than or equal to the input value.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is processed without errors, the ENO enable output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- Errors such as an overflow occur during execution.

Parameters

The following table shows the parameters of the "Generate next lower integer from floating-point number" instruction:

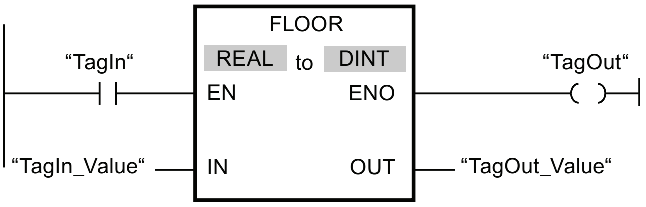
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Input value
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Result with next lower integer

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value	
IN	TagIn_Value	0.50000000	-0.50000000
OUT	TagOut_Value	0	-1

If operand "TagIn" has the signal state "1", then the "Generate next lower integer from floating-point number" instruction will be executed. The floating-point number at input "TagIn_Value" is rounded to the next lower integer and sent to output "TagOut_Value". If the instruction is executed without errors, the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

TRUNC: Truncate numerical value

Description

You can use the "Truncate numerical value" instruction to form an integer from the value at the IN input. The value at the IN input is interpreted as a floating-point number. The instruction selects only the integer part of the floating-point number and sends this to the OUT output without decimal places.

The instruction is only executed if the signal state is "1" at the EN enable input. If the instruction is executed without errors, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- Errors such as an overflow occur during execution.

Parameters

The following table shows the parameters of the "Truncate numerical value" instruction:

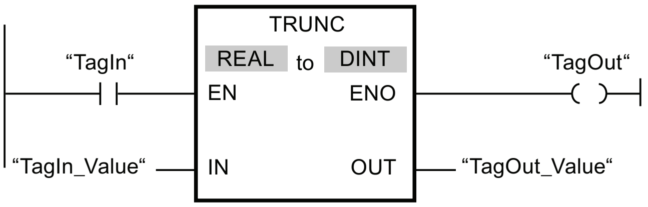
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Input value
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Integer part of the input value

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value	
IN	TagIn_Value	0.50000000	- 0.50000000
OUT	TagOut_Value	0	0

If operand "TagIn" has the signal state "1", the "Truncate numerical value" instruction is executed. The integer part of the floating-point number at the "TagIn_Value" input is converted to an integer and sent to the "TagOut_Value" output. If the instruction is executed without errors, the "TagOut" output is set.

See also

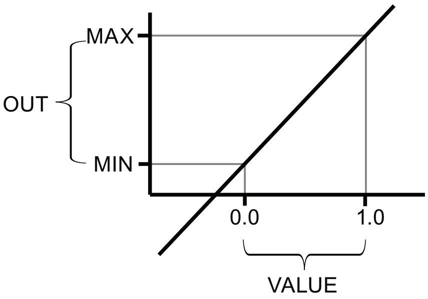
Overview of the valid data types (Page 741)

SCALE_X: Scale

Description

The "Scale" instruction scales the value at input VALUE by mapping it to a specified value range. When the "Scale" instruction is executed, the floating-point value at the VALUE input is scaled to the value range that was defined by the MIN and MAX parameters. The result of the scaling is an integer, which is stored in the OUT output.

The following figure shows an example of how values can be scaled:



The "Scale" instruction can only be executed when the signal state at the EN enable input is "1". In this case, the ENO enable output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The value at the MIN input is greater than or equal to the value at the MAX input.
- The value of a specified floating-point number is outside the range of the normalized numbers according to IEEE-754.
- An overflow occurs.
- The value at the VALUE input is NaN (Not a Number = result of an invalid arithmetic operation).

Parameters

The following table shows the parameters of the "Scale" instruction:

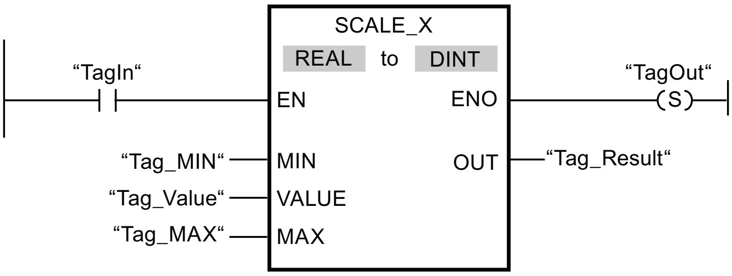
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
MIN	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Low limit of the value range
VALUE	Input	Floating-point numbers	I, Q, M, D, L or constant	Value to be scaled.
MAX	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	High limit of the value range
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Result of scaling

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
MIN	Tag_MIN	10
VALUE	Tag_Value	0.5
MAX	Tag_MAX	30
OUT	Tag_Result	20

If operand "TagIn" has the signal state "1", the "Scale" instruction is executed. The value at the "Tag_Value" input is scaled to the range of values defined by the values at the "Tag_MIN" and "Tag_MAX" inputs. The result is stored in the "Tag_Result" output. If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

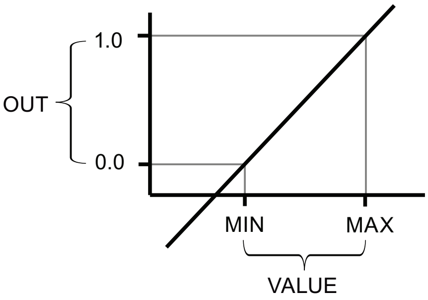
NORM_X: Normalize (Page 1350)

NORM_X: Normalize

Description

The "Normalize" instruction normalizes the value of the tag at input VALUE by mapping it to a linear scale. You can use the MIN and MAX parameters to define the limits of a value range that is applied to the scale. The result at the OUT output is calculated and stored as a floating-point number depending on the location of the value to be normalized within this value range. If the value to be normalized is equal to the value at the MIN input, the OUT output has the value "0.0". If the value to be normalized is equal to the value at the MAX input, the OUT output has the value "1.0".

The following figure shows an example of how values can be normalized:



The "Normalize" instruction can only be executed when the signal state at the EN enable input is "1". In this case, the ENO enable output has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The value at the MIN input is greater than or equal to the value at the MAX input.
- The value of a specified floating-point number is outside the range of the normalized numbers according to IEEE-754.
- The value at the VALUE input is NaN (result of an invalid arithmetic operation).

Parameters

The following table shows the parameters of the "Normalize" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
MIN	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Low limit of the value range

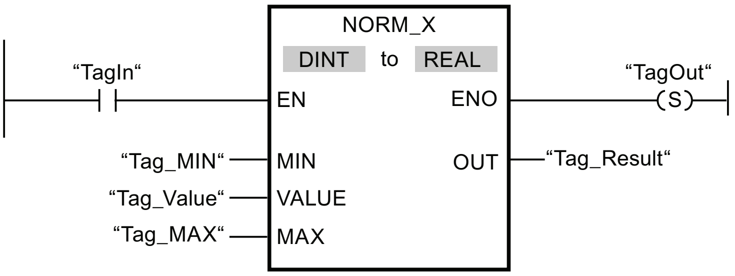
Parameters	Declaration	Data type	Memory area	Description
VALUE	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Value to be normalized.
MAX	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	High limit of the value range
OUT	Output	Floating-point numbers	I, Q, M, D, L	Result of the normalization

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
MIN	Tag_MIN	10
VALUE	Tag_Value	20
MAX	Tag_MAX	30
OUT	Tag_Result	0.5

If operand "TagIn" has the signal state "1", the "Normalize" instruction is executed. The value at the "Tag_Value" input is mapped to the range of values that were defined by the values at the "Tag_MIN" and "Tag_MAX" inputs. The tag value at the "Tag_Value" input is normalized to the defined value range. The result is stored as a floating-point number in the "Tag_Result" output. If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

SCALE_X: Scale (Page 1348)

Program control operations

---(JMP): Jump if RLO = 1

Description

You can use the "Jump if RLO = 1" instruction to interrupt the linear execution of the program and resume it in another network. The destination network must be identified by a jump label (LABEL). The name of this jump label is specified in the placeholder above the instruction.

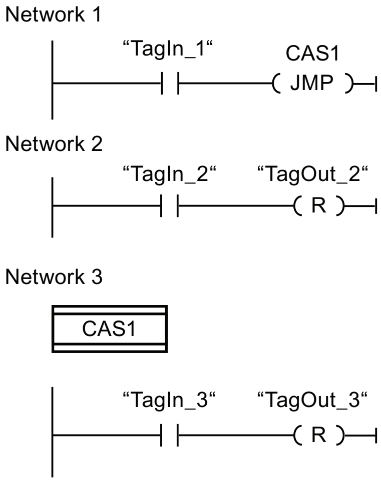
The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block.

If the result of logic operation (RLO) at the input of the instruction is "1", the jump to the network identified by the specified jump label is executed. The jump direction can be towards higher or lower network numbers.

If the condition at the input of the instruction is not fulfilled (RLO = 0), execution of the program continues in the next network.

Example

The following example shows how the instruction works:



If operand "TagIn_1" has the signal state "1", the "Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. If the "TagIn_3" input has the signal state "1", the "TagOut_3" output is set.

---(JMPN): Jump if RLO = 0

Description

You can use the instruction "Jump if RLO = 0" to interrupt the linear execution of the program and resume it in another network, when the result of logic operation at the input of the instruction is "0". The destination network must be identified by a jump label (LABEL). The name of this jump label is specified in the placeholder above the instruction.

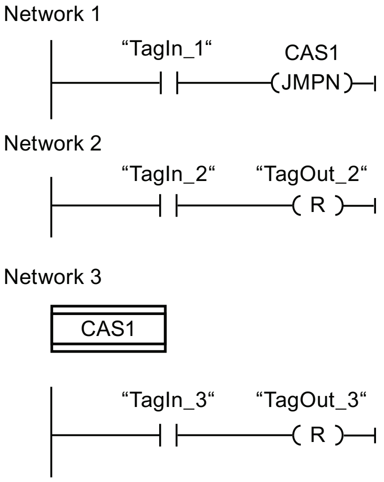
The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block.

If the result of logic operation (RLO) at the input of the instruction is "0", the jump to the network identified by the specified jump label is executed. The jump direction can be towards higher or lower network numbers.

If the result of the logic operation at the input of the instruction is "1", execution of the program continues in the next network.

Example

The following example shows how the instruction works:



If the operand "TagIn_1" has the signal state "0", the instruction "Jump if RLO = 0" is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. If the "TagIn_3" input has the signal state "1", the "TagOut_3" output is set.

See also

Overview of the valid data types (Page 741)

LABEL: Jump label

Description

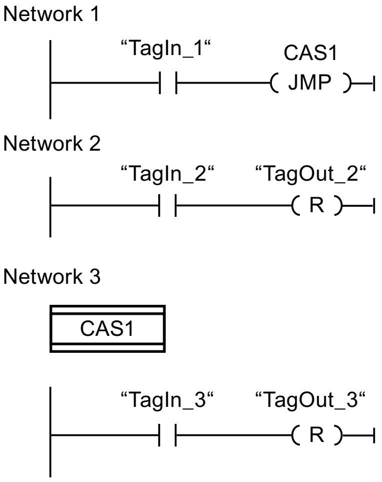
You can use a jump label to identify a destination network, in which the program execution should resume when a jump is executed.

The jump label and the instruction in which the jump label is specified must be located in the same block. The name of a jump label can only be assigned once in a block.

Only one jump label can be placed in a network. Each jump label can jump to several locations.

Example

The following example shows how the instruction works:



If operand "TagIn_1" has the signal state "1", the "Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. If the "TagIn_3" input has the signal state "1", the "TagOut_3" output is set.

JMP_LIST: Define jump list

Description

The "Define jump list" instruction defines several conditional jumps and resumes the program execution in a specific network depending on the value of the K parameter.

You define the jumps with jump labels (LABEL), which you specify at the outputs of the instruction box. The number of outputs can be expanded in the instruction box. The numbering of the outputs begins with the value "0" and continues in ascending order with each new output. Only jump labels can be specified at the outputs of the instruction. Instructions or operands cannot be specified.

The value of the K parameter specifies the number of the output and thus the jump label where the program execution is to be resumed. If the value in the K parameter is greater than the number of available outputs, the program execution is resumed in the next network of the block.

The "Define jump list" instruction is only executed if the signal state is "1" at the EN enable input.

Parameters

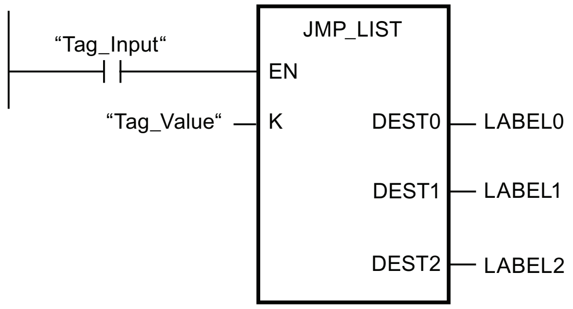
The following table shows the parameters of the "Define jump list" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, L, D	Enable input
K	Input	UINT	I, Q, M, L, D or constant	Specifies the number of the output and thus the jump that is to be made. (K=0 to 99)
DEST0	-	-	-	First jump label
DEST1	-	-	-	Second jump label
Dest(n)	-	-	-	Optional jump labels (n = 2 to 99)

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand/Jump label	Value
K	"Tag_Value"	1
Dest 0	LABEL0	Jump to the network that is identified with the jump label "LABEL0".
Dest 1	LABEL1	Jump to the network that is identified with the jump label "LABEL1".
Dest 2	LABEL2	Jump to the network that is identified with the jump label "LABEL2".

If operand "Tag_Input" has the signal state "1", the "Define jump list" instruction is executed. The program execution is resumed according to the value of operand "Tag_Value" in the network that is identified with the jump label "LABEL1".

Overview of the valid data types (Page 741)

Inserting additional inputs and outputs in LAD elements (Page 927)

Removing inputs and outputs (Page 928)

SWITCH: Jump distributor

Description

You can use the "Jump distributor" instruction to define multiple program jumps to be executed depending on the result of one or more comparison instructions.

You specify the value to be compared in the K parameter. This value is compared with the values that are provided by the various inputs. You can select the comparison method for each individual input. The availability of the various comparison instructions depends on the data type of the instruction.

The following table shows the comparison instructions that are available depending on the selected data type:

Data type	Instruction	Syntax
Bit strings	Equal	==
	Not equal	<>
Integers, floating-point numbers, TIME, DATE, TOD	Equal	==
	Not equal	<>
	Greater or equal	>=
	Less or equal	<=
	Greater than	>
	Less than	<

You can select the data type of the instruction from the "<???>" drop-down list of the instruction box. If you select a comparison instruction and the data type of the instruction is not yet defined, the "<???>" drop-down list only offers the data types that are permitted for the selected comparison instruction.

Execution of the instruction begins with the first comparison and runs until a comparison condition is met. If a comparison condition is met, the subsequent comparison conditions are not considered. If none of the specified comparison conditions are met, the jump at the ELSE output is executed. If no program jump is defined at the ELSE output, execution of the program continues in the next network.

The number of outputs can be expanded in the instruction box. The numbering of the outputs begins with the value "0" and continues in ascending order with each new output. Specify jump labels (LABEL) at the outputs of the instruction. Instructions or operands cannot be specified at the outputs of the instruction.

An input is automatically inserted for each additional output. The jump programmed at an output is executed if the comparison condition of the corresponding input is fulfilled.

Parameters

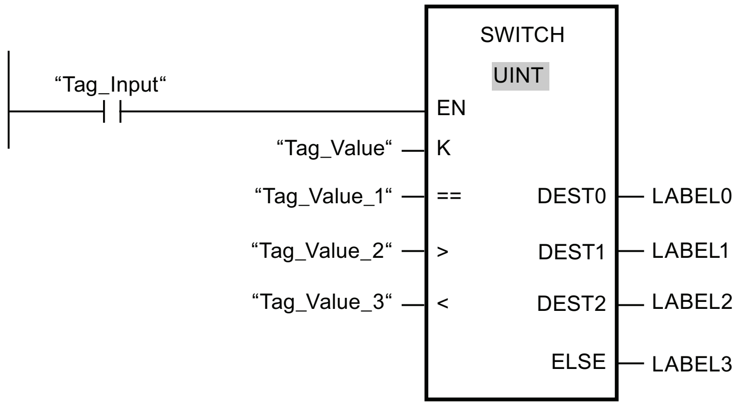
The following table shows the parameters of the "Jump distributor" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
K	Input	UINT	I, Q, M, D, L or constant	Specifies the value to be compared.
<Comparison values>	Input	Bit strings, integers, floating-point numbers, TIME, DATE, TOD	I, Q, M, D, L or constant	Input value with which the value of the K parameter is compared.
DEST0	-	-	-	First jump label
DEST1	-	-	-	Second jump label
DEST(n)	-	-	-	Optional jump labels (n = 2 to 99)
ELSE	-	-	-	Program jump that is executed when none of the comparison conditions are fulfilled.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand/Jump label	Value
K	Tag_Value	23
==	Tag_Value_1	20
>	Tag_Value_2	21
<	Tag_Value_3	19
Dest 0	LABEL0	Jump to jump label "LABEL0", if the value of the K parameter equals 20.
Dest 1	LABEL1	Jump to jump label "LABEL1" if the value of the K parameter is greater than 21.
Dest 2	LABEL2	Jump to jump label "LABEL2", if the value of the K parameter is less than 19.
ELSE	LABEL 3	Jump to jump label "LABEL3", if the none of the comparison conditions are fulfilled.

If the operand "Tag_Input" changes to signal state "1", the instruction "Jump distributor" is executed. The execution of the program is continued in the network that is identified with the jump label "LABEL1".

Inserting additional inputs and outputs in LAD elements (Page 927)

Removing inputs and outputs (Page 928)

--(RET): Return

Description

You can use the "Return" instruction to stop the execution of a block. The results is three types through which the block processing can be completed.

- Without call of the "Return" instruction

  The block is exited after execution of the last network. The ENO of the function call is set to the signal state "1".
- Call of the "Return" instruction with preceding logic operation (see example)

  If the left connector has the signal state "1", the block will be exited. The ENO of the function call corresponds to the operand.
- Call of the "Return" instruction without previous logic operation

  The block is exited. The ENO of the function call corresponds to the operand.

Note

Only one jumping coil may be used in a network ("Return", "Jump if RLO=1", "Jump if RLO=0").

If the result of logic operation (RLO) at the input of the "Return" instruction is "1", program execution is terminated in the currently called block and resumed after the call function in the calling block (for example, in the calling OB). The status (ENO) of the call function is determined by the parameter of the instruction. This can assume the following values:

- RLO
- TRUE/FALSE
- <Operand>

To set the parameter values, double-click the instruction and select the corresponding value in the drop-down list.

The following table shows the status of the call function if the "Return" instruction is programmed in a network within the called block:

RLO	Parameter value	ENO of the call function
1	RLO	1
	TRUE	1
	FALSE	0
	<Operand>	<Operand>
0	RLO	The program execution continues in the next network of the called block.
	TRUE	
	FALSE	
	<Operand>	

If an OB is completed, another block will be selected and started or executed by the priority class system:

- If the program cycle OB was completed, it will be restarted.
- If an OB is completed that has interrupted another block (e.g. an Alarm OB), then the interrupted block (e.g. program cycle OB) will be executed.

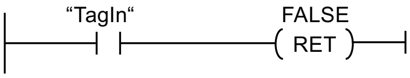
Parameters

The following table shows the parameters of the "Return" instruction:

Parameters	Declaration	Data type	Memory area	Description
RLO	-	-		The status of the call function is set to the signal state of the RLO.
TRUE	-	-		If RLO=1, the status of the call function is set to "1".
FALSE	-	-		If RLO=1, the status of the call function is set to "0".
<Operand>	Input	BOOL	I, Q, M, D, L	If RLO=1, the status of the call function is set to the signal state of the specified operand.

Example

The following example shows how the instruction works:



If operand "TagIn" has the signal state"1", the "Return" instruction is executed. Program execution is terminated in the called block and continues in the calling block. The ENO output of the call function is reset to signal state "0".

Runtime control

RE_TRIGR: Restart cycle monitoring time

Description

You can use the "Restart cycle monitoring time" instruction to restart the cycle monitoring of the CPU. The cycle time monitoring then starts over again for the duration you have set in the CPU configuration. By restarting the cycle monitoring time, you can prevent errors being triggered or the CPU changing to STOP.

The "Restart cycle monitoring time" instruction can be used in blocks of priority class 1 (the cyclic OB) and in the blocks called within it.

If the instruction is called in a block with a higher priority, such as a hardware interrupt, diagnostic interrupt, or cyclic interrupt, the instruction is not executed and the ENO enable output is set to signal state "0".

Parameters

The "Restart cycle monitoring time" instruction has no parameters.

STP: Exit program

Description

You use the "Exit program" instruction to set the CPU to STOP mode and therefore to terminate the execution of the program. The effects of changing from RUN to STOP depend on the CPU configuration.

When the RLO at the input of the instruction is "1", the CPU changes to STOP mode and program execution is terminated. The signal state at the output of the instruction is not evaluated.

When the RLO is "0" at the input of the instruction, then the instruction will not be executed.

Parameters

The "Exit program" instruction has no parameters.

GetError: Get error locally

Description

The "Get error locally" instruction is used to query the occurrence of errors within a block. If the system signals errors during block execution, detailed information about the first error that occurred is saved in the operand at the ERROR output.

Only operands of the "ErrorStruct" system data type can be specified at the ERROR output. The "ErrorStruct" system data type specifies the exact structure in which the information about the error is stored. Using additional instructions, you can evaluate this structure and program an appropriate response. When the first error has been eliminated, the instruction outputs information about the next error that occurred.

Parameters

The following table shows the parameters of the "Get error locally" instruction:

Parameters	Declaration	Data type	Memory area	Description
ERROR	Output	ErrorStruct	D, L	Error information

Data type "ErrorStuct"

The following table shows the structure of the "ErrorStruct" data type:

Structure components		Data type	Description
ERROR_ID		WORD	Error ID
FLAGS		BYTE	Shows if an error occurred during a block call. 16#01: Error during a block call. 16#00: No error during a block call.
REACTION		BYTE	Default reaction: 0: Ignore (write error), 1: Continue with substitute value "0" (read error), 2: Skip instruction (system error)
CODE_ADDRESS		CREF	Information about the address and type of block
	BLOCK_TYPE	BYTE	Type of block where the error occurred: 1: OB 2: FC 3: FB
	CB_NUMBER	UINT	Number of the code block
	OFFSET	UDINT	Reference to the internal memory
MODE		BYTE	Access mode: Depending on the type of access, the following information can be output: Mode | (A) | (B) | (C) | (D) | (E)

Structure components		Data type	Description					
			0					
			1					Offset
			2			Area		
			3	Location	Scope		Number	
			4			Area		Offset
			5			Area	DB no.	Offset
			6	PtrNo./Acc		Area	DB no.	Offset
			7	PtrNo./Acc	Slot No. / Scope	Area	DB no.	Offset
OPERAND_NUMBER		UINT	Operand number of the machine command					
POINTER_NUMBER_ LOCATION		UINT	(A) Internal pointer					
SLOT_NUMBER_SCOPE		UINT	(B) Storage area in internal memory					
DATA_ADDRESS		NREF	Information about the address of an operand					
	AREA	BYTE	(C) Memory area: L: 16#40 – 4E, 86, 87, 8E, 8F, C0 – CE E: 16#81 A: 16#82 M: 16#83 DB: 16#84, 85, 8A, 8B					
	DB_NUMBER	UINT	(D) Number of the data block					
	OFFSET	UDINT	(E) Relative address of the operand					

Structure component "ERROR_ID"

The following table shows the values that can be output on the structure component "ERROR_ID":

ID (hexadecimal)	ID (decimal)	Description
0	0	No error
2503	9475	Invalid pointer
2505	9477	Calling the instruction "Stop" (SFC46) in the user program
2520	9504	Invalid STRING
2522	9506	Read error: Operand outside the valid range
2523	9507	Write error: Operand outside the valid range
2524	9508	Read error: Invalid operand
2525	9509	Write error: Invalid operand
2528	9512	Read error: Data alignment

ID (hexadecimal)	ID (decimal)	Description
2529	9513	Write error: Data alignment
252C	9516	Invalid pointer
2530	9520	Write error: Data block
2533	9523	Invalid pointer used
2534	9524	Block number error FC
2535	9525	Block number error FB
2538	9528	Access error: DB does not exist
2539	9529	Access error: Wrong DB used
253A	9530	Global data block does not exist
253C	9532	Faulty information or the function does not exist
253D	9533	System function does not exist
253E	9534	Faulty information or the function block does not exist
253F	9535	System block does not exist
2550	9552	Access error: DB does not exist
2551	9553	Access error: Wrong DB used
2575	9589	Error in the program nesting depth
2576	9590	Error in the local data distribution
2942	10562	Read error: Input
2943	10563	Write error: Output

The ENO enable output of the "Get error locally" instruction is only set if the EN enable input has the signal state "1" and error information is present. If one of these conditions is not fulfilled, the remaining program execution is not affected by the "Get error locally" instruction.

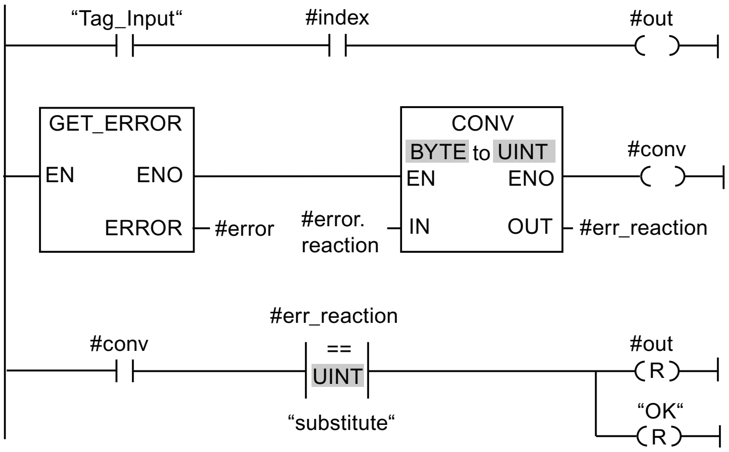
The "Get error locally" instruction can also be used to forward an alarm about the error status to the calling block. To do this, the instruction must be positioned in the last network of the called block.

Note

The "Get error locally" instruction enables local error handling within a block. If "Get error locally" is inserted in the program code of a block, any predefined system responses are ignored when an error occurs.

Example

The following example shows how the instruction works:



When an error occurs, the "Get error locally" instruction returns the error information to the locally created "#error" structure at the ERROR output. The error information is converted and evaluated using the "Equal" comparison instruction. Information about the type of error is the first comparison value assigned to the instruction. The value "1" is specified in operand "substitute" as the second comparison value. If the error is a read error, the condition of the comparison instruction is fulfilled. The "#out" and "OK" outputs are reset in this case.

GetErrorID: Get error ID locally

Description

The "Get error ID locally" instruction is used to query the occurrence of errors within a block. If the system signals errors during block execution, the error ID of the first error that occurred is saved in the tag at output ID. Only operands of the WORD data type can be specified at the ID output. When the first error has been eliminated, the instruction outputs the error ID of the next error that occurred.

The output of the "Get error ID locally" instruction is only set if the input of the instruction has the signal state "1" and error information is present. If one of these conditions is not fulfilled, the remaining program execution is not affected by the "Get error ID locally" instruction.

The "Get error ID locally" instruction can also be used to forward an alarm about the error status to the calling block. To do this, the instruction must be positioned in the last network of the called block.

Note

The "Get error ID locally" instruction enables local error handling within a block. If the "Get error ID locally" instruction is inserted in the program code of a block, any predefined system responses are ignored when an error occurs.

Parameters

The following table shows the parameters of the "Get error ID locally" instruction:

Parameters	Declaration	Data type	Memory area	Description
ID	Output	WORD	I, Q, M, D, L	Error ID

Parameters ID

The following table shows the values that can be output in the ID parameter:

ID (hexadecimal)	ID (decimal)	Description
0	0	No error
2503	9475	Invalid pointer
2505	9477	Calling the instruction "Stop" (SFC46) in the user program
2520	9504	Invalid STRING
2522	9506	Read error: Operand outside the valid range
2523	9507	Write error: Operand outside the valid range
2524	9508	Read error: Invalid operand
2525	9509	Write error: Invalid operand
2528	9512	Read error: Data alignment
2529	9513	Write error: Data alignment
252C	9516	Invalid pointer
2530	9520	Write error: Data block
2533	9523	Invalid pointer used
2534	9524	Block number error FC
2535	9525	Block number error FB
2538	9528	Access error: DB does not exist
2539	9529	Access error: Wrong DB used
253A	9530	Global data block does not exist
253C	9532	Faulty information or the function does not exist
253D	9533	System function does not exist
253E	9534	Faulty information or the function block does not exist
253F	9535	System block does not exist
2550	9552	Access error: DB does not exist
2551	9553	Access error: Wrong DB used
2575	9589	Error in the program nesting depth
2576	9590	Error in the local data distribution
2942	10562	Read error: Input
2943	10563	Write error: Output

Word logic operations

AND: AND logic operation

Description

You can use the "AND logic operation" instruction to combine the value at the IN1 input and the value at the IN2 input bit-by-bit by AND logic and query the result at the OUT output.

When the instruction is executed, bit 0 of the value at the IN1 input and bit 0 of the value at the IN2 input are logically ANDed. The result is stored in bit 0 of the OUT output. The same logic operation is executed for all other bits of the specified values.

The number of inputs can be expanded in the instruction box. The added inputs are numbered in ascending order in the box. When the instruction is executed, the values of all available input parameters are combined with AND logic (ANDed). The result is stored in the OUT output.

The result bit has the signal state "1" only when both of the bits in the logic operation also have signal state "1". If one of the two bits of the logic operation has the signal state "0", the corresponding result bit is reset.

The instruction is only executed if the signal state is "1" at the EN enable input. In this case, the ENO output also has the signal state "1".

If the signal state at the EN enable input is "0", the ENO enable output also has the signal state "0".

Parameters

The following table shows the parameters of the "AND logic operation" instruction:

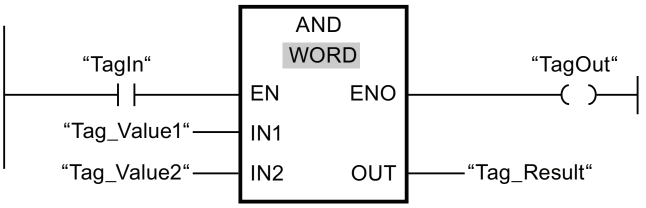
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Bit strings	I, Q, M, D, L or constant	First value for logic operation
IN2	Input	Bit strings	I, Q, M, D, L or constant	Second value for logic operation
INn	Input	Bit strings	I, Q, M, D, L or constant	Other inputs whose values are logically combined.
OUT	Output	Bit strings	I, Q, M, D, L	Result of the instruction

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN1	Tag_Value1	01010101 01010101
IN2	Tag_Value2	00000000 00001111
OUT	Tag_Result	00000000 00000101

If operand "TagIn" has the signal state "1", the "AND logic operation" instruction is executed. The value of operand "Tag_Value1" and the value of operand "Tag_Value2" are ANDed. The result is mapped bit-for-bit and output in operand "Tag_Result". The ENO output and the "TagOut" output are set to signal state "1".

OR: OR logic operation

Description

You can use the "OR logic operation" instruction to combine the value at the IN1 input and the value at the IN2 input bit-by-bit by OR logic and query the result at the OUT output.

When the instruction is executed, bit 0 of the value at the IN1 input and bit 0 of the value at the IN2 input are logically ORed. The result is stored in bit 0 of the OUT output. The same logic operation is executed for all bits of the specified tags.

The number of inputs can be expanded in the instruction box. The added inputs are numbered in ascending order in the box. When the instruction is executed, the values of all available input parameters are combined with OR logic (ORed). The result is stored in the OUT output.

The result bit has the signal state "1" when at least one of the two bits in the logic operation has the signal state "1". If both of the bits of the logic operation have signal state "0", the corresponding result bit is reset.

The instruction is only executed if the signal state is "1" at the EN enable input. In this case, the ENO output also has the signal state "1".

If the signal state at the EN enable input is "0", the ENO enable output also has the signal state "0".

Parameters

The following table shows the parameters of the "OR logic operation" instruction:

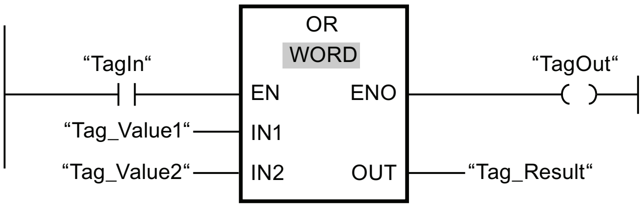
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Bit strings	I, Q, M, D, L or constant	First value for logic operation
IN2	Input	Bit strings	I, Q, M, D, L or constant	Second value for logic operation
INn	Input	Bit strings	I, Q, M, D, L or constant	Other inputs whose values are logically combined.
OUT	Output	Bit strings	I, Q, M, D, L	Result of the instruction

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN1	Tag_Value1	01010101 01010101
IN2	Tag_Value2	00000000 00001111
OUT	Tag_Result	01010101 01011111

If operand "TagIn" has the signal state "1", the "OR logic operation" instruction is executed. The value of operand "Tag_Value1" and the value of operation "Tag_Value2" are ORed. The result is mapped bit-for-bit and output in operand "Tag_Result". The ENO output and the "TagOut" output are set to signal state "1".

XOR: EXCLUSIVE OR logic operation

Description

You can use the "EXCLUSIVE OR logic operation" to combine the value at the IN1 input and the value at the IN2 input bit-by-bit by EXCLUSIVE OR logic and query the result at the OUT output.

When the instruction is executed, bit 0 of the value at the IN1 input and bit 0 of the value at the IN2 input are logically EXCLUSIVELY ORed. The result is stored in bit 0 of the OUT output. The same logic operation is executed for all other bits of the specified value.

The number of inputs can be expanded in the instruction box. The added inputs are numbered in ascending order in the box. When the instruction is executed, the values of all available input parameters are combined with EXCLUSIVE OR logic (EXCLUSIVELY ORed). The result is stored in the OUT output.

The result bit has the signal state "1" when one of the two bits in the logic operation has the signal state "1". If both of the bits of the logic operation have signal state "1" or "0", the corresponding result bit is reset.

The instruction is only executed if the signal state is "1" at the EN enable input. In this case, the ENO output also has the signal state "1".

If the signal state at the EN enable input is "0", the ENO enable output also has the signal state "0".

Parameters

The following table shows the parameters of the "EXCLUSIVE OR logic operation" instruction:

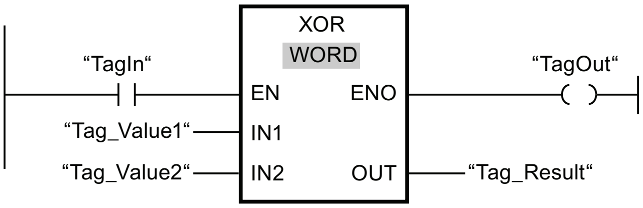
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Bit strings	I, Q, M, D, L or constant	First value for logic operation
IN2	Input	Bit strings	I, Q, M, D, L or constant	Second value for logic operation
INn	Input	Bit strings	I, Q, M, D, L or constant	Other inputs whose values are logically combined.
OUT	Output	Bit strings	I, Q, M, D, L	Result of the instruction

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN1	Tag_Value1	01010101 01010101
IN2	Tag_Value2	00000000 00001111
OUT	Tag_Result	01010101 01011010

If operand "TagIn" has the signal state "1", the "EXCLUSIVE OR logic operation" instruction is executed. The value of operand "Tag_Value1" and the value of operand "Tag_Value2" are EXCLUSIVELY ORed. The result is mapped bit-for-bit and output in operand "Tag_Result". The ENO output and the "TagOut" output are set to signal state "1".

INV: Create ones complement

Description

You can use the "Create ones complement" instruction to invert the signal state of the bits at the IN input. When the instruction is processed, the value at the IN input and a hexadecimal template (W#16#FFFF for 16-bit numbers or DW#16#FFFF FFFF for 32-bit numbers) are logically EXCLUSIVELY ORed. As a result, the signal state of the individual bits is inverted and sent to the OUT output.

The instruction is only executed if the signal state is "1" at the EN enable input. In this case, the ENO output also has the signal state "1".

If the signal state at the EN enable input is "0", the ENO enable output also has the signal state "0".

Parameters

The following table shows the parameters of the "Create ones complement" instruction:

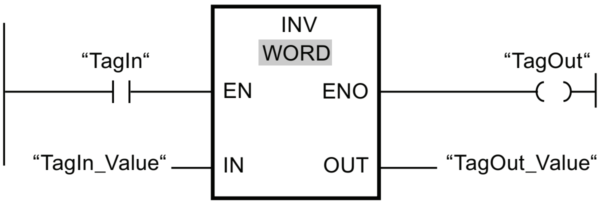
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers	I, Q, M, D, L or constant	Input value
OUT	Output	Bit strings, integers	I, Q, M, D, L	Ones complement of the value at input IN

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value	
IN	TagIn_Value	W#16#000F	W#16#7E
OUT	TagOut_Value	W#16#FFF0	W#16#81

If operand "TagIn" has the signal state "1", then the "Create ones complement" instruction will be executed. The instruction inverts the signal state of the individual bits at the TagIn_Value" input and writes the result to the "TagOut_Value" output. The ENO output and the "TagOut" output are set to signal state "1".

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

DECO: Decode

Description

You can use the "Decode" instruction to set a bit in the output value specified by the input value.

The "Decode" instruction reads the value at the IN input and sets the bit in the output value whose bit position corresponds to the read value. The other bits in the output value will be overwritten with zeroes. When the value at the IN input is greater than 31, a modulo 32 instruction is executed.

The "Decode" instruction is only started when the signal state at the EN enable input is "1". If no errors occur during execution, the ENO output also has the signal state "1".

If the signal state at the EN enable input is "0", the ENO enable output also has the signal state "0".

Parameters

The following table shows the parameters of the "Decode" instruction:

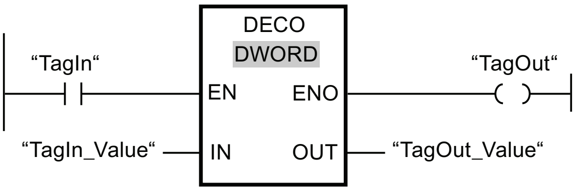
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	UINT	I, Q, M, D, L or constant	Input value
OUT	Output	Bit strings	I, Q, M, D, L	Output value

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

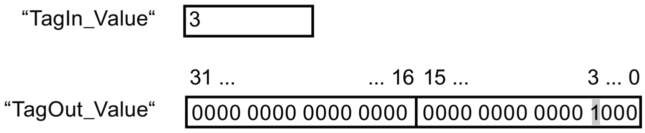
For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following figure shows how the instruction works using specific operand values:



If operand "TagIn" has the signal state "1", the "Decode" instruction is executed. The instruction reads bit number "3" from the value at the "TagIn_Value" input and sets the third bit in the value at the "TagOut_Value" output.

If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

ENCO: Encode

Description

You can use the "Encode" instruction to read the bit number of the least significant bit in the input value and to send it to the OUT output.

The "Encode" instruction selects the least significant bit of the value at the IN input and writes its bit number to the tag in the OUT output.

The "Encode" instruction is only started when the signal state at the EN enable input is "1". If no errors occur during execution, the ENO output also has the signal state "1".

If the signal state at the EN enable input is "0", the ENO enable output also has the signal state "0".

Parameters

The following table shows the parameters of the "Encode" instruction:

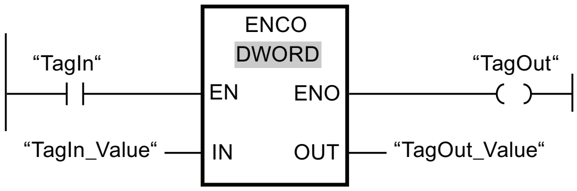
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings	I, Q, M, D, L or constant	Input value
OUT	Output	INT	I, Q, M, D, L	Output value

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

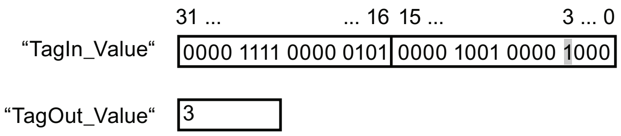
For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following figure shows how the instruction works using specific operand values:



If operand "TagIn" has the signal state "1", the "Encode" instruction is executed. The instruction selects the least significant bit at the "TagIn_Value" input and writes bit position "3" to the tag in the "TagOut_Value" output.

If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

Basics of the EN/ENO mechanism (Page 819)

SEL: Select

Description

Depending on a switch (G input), the "Select" instruction selects one of the IN0 or IN1 inputs and copies its content to the OUT output. When the G input has the signal state "0", the value at the IN0 input is moved. When the G input has the signal state "1", the value at the IN1 input is copied to the OUT output.

Execution of the instruction assumes the signal state "1" at the EN enable input and that the tags are of the same data type at all parameters. If the instruction is executed without errors, the ENO enable output also has the signal state "1".

The ENO enable output is reset when the EN enable input has the signal state "0" or errors occur during execution of the instruction.

Parameters

The following table shows the parameters of the "Select" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
G	Input	BOOL	I, Q, M, D, L	Switch
IN0	Input	Bit strings, integers, floating-point numbers, TIME, TOD, DATE, characters	I, Q, M, D, L or constant	First input value

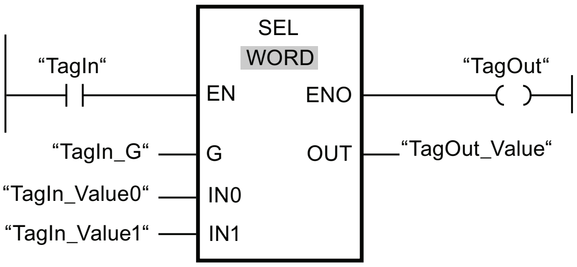
Parameters	Declaration	Data type	Memory area	Description
IN1	Input	Bit strings, integers, floating-point numbers, TIME, TOD, DATE, characters	I, Q, M, D, L or constant	Second input value
OUT	Output	Bit strings, integers, floating-point numbers, TIME, TOD, DATE, characters	I, Q, M, D, L	Result

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value	
G	TagIn_G	0	1
IN0	TagIn_Value0	W#16#0000	W#16#4C
IN1	TagIn_Value1	W#16#FFFF	W#16#5E
OUT	TagOut_Value	W#16#0000	W#16#5E

If operand "TagIn" has the signal state "1", the "Select" instruction is executed. Based on the signal state at the "TagIn_G" input, the value at the "TagIn_Value0" or "TagIn_Value1" input is selected and copied to the "TagOut_Value" output. If the instruction is executed without errors, enable output ENO has the signal state "1" and the "TagOut" output is set.

Basics of the EN/ENO mechanism (Page 819)

MUX: Multiplex

Description

You can use the "Multiplex" instruction to copy the content of a selected input to the OUT output. The number of selectable inputs of the instruction box can be expanded. The inputs are automatically numbered in the box. Numbering starts at IN0 and continues consecutively with each new input. You use the K parameter to define the input whose content is to be copied to the OUT output. If the value of the K parameter is greater than the number of available inputs, the content of the ELSE parameter is copied to the OUT output and the ENO enable output is assigned the signal state "0".

The "Multiplex" instruction can only be executed, when the tags in all inputs and in the OUT output have the same data type. The K parameter is an exception, since only integers can be specified for it.

The instruction is only executed if the signal state is "1" at the EN enable input. If no errors occur during execution, the ENO output also has the signal state "1".

The ENO enable output is reset if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value of the K parameter is greater than the number of available inputs.
- Errors occurred during execution of the instruction.

Parameters

The following table shows the parameters of the "Multiplex" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
K	Input	UINT	I, Q, M, D, L or constant	Specifies the input whose content is to be copied.
IN0	Input	Bit strings, integers, floating-point numbers, TIME, TOD, DATE, CHAR	I, Q, M, D, L or constant	First input value
IN1	Input	Bit strings, integers, floating-point numbers, TIME, TOD, DATE, CHAR	I, Q, M, D, L or constant	Second input value
INn	Input	Bit strings, integers, floating-point numbers, TIME, TOD, DATE, CHAR	I, Q, M, D, L or constant	Optional input values

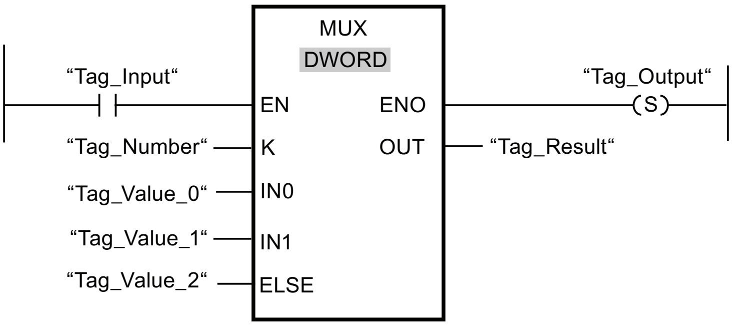
Parameters	Declaration	Data type	Memory area	Description
ELSE	Input	Bit strings, integers, floating-point numbers, TIME, TOD, DATE, CHAR	I, Q, M, D, L or constant	Specifies the value to be copied with K > n.
OUT	Output	Bit strings, integers, floating-point numbers, TIME, TOD, DATE, CHAR	I, Q, M, D, L	Output to which the value is to be copied.

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
K	Tag_Number	1
IN0	Tag_Value_0	DW#16#00000000
IN1	Tag_Value_1	DW#16#3E4A7D
ELSE	Tag_Value_2	DW#16#FFFF0000
OUT	Tag_Result	DW#16#3E4A7D

If operand "Tag_Input" has the signal state "1", the "Multiplex" instruction is executed. Depending in the value of operand Tag_Number, the value at the "Tag_Value_1" input is copied and assigned to the operand at the "Tag_Result" output. If the instruction is executed without errors, the "ENO" and Tag_Output outputs are set.

Basics of the EN/ENO mechanism (Page 819)

DEMUX: Demultiplex

Description

You can use the "Demultiplex" instruction to copy the content of the IN input to a selected output. The number of selectable outputs can be expanded in the instruction box. The outputs are automatically numbered in the box. Numbering starts at OUT0 and continues consecutively with each new input. You use the K parameter to define the output to which the content of the IN input is to be copied. The other outputs are not changed. If the value of the K parameter is greater than the number of available outputs, then the content of the IN input will be copied to the ELSE parameter and the signal state "0" is assigned to the ENO enable output.

The "Demultiplex" instruction can only be executed if the tags in the IN input and in all outputs have the same data type. The K parameter is an exception, since only integers can be specified for it.

The instruction is only executed if the signal state is "1" at the EN enable input. If no errors occur during execution, the ENO output also has the signal state "1".

The ENO enable output is reset if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value of the K parameter is greater than the number of available outputs.
- Errors occurred during execution of the instruction.

Parameters

The following table shows the parameters of the "Demultiplex" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
K	Input	UINT	I, Q, M, D, L or constant	Specifies the output to which the input value (IN) is copied.
IN	Input	Bit strings, integers, floating-point numbers, CHAR, TIME	I, Q, M, D, L or constant	Input value
OUT0	Output	Bit strings, integers, floating-point numbers, CHAR, TIME	I, Q, M, D, L	First output

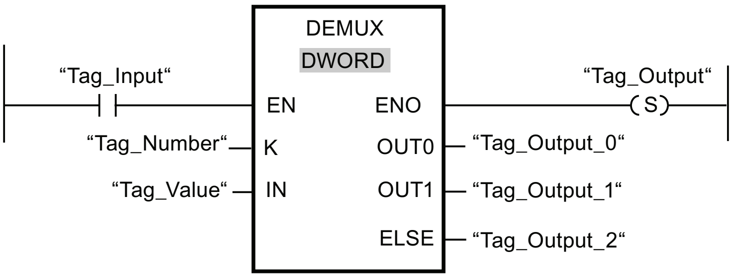
Parameters	Declaration	Data type	Memory area	Description
OUT1	Output	Bit strings, integers, floating-point numbers, CHAR, TIME	I, Q, M, D, L	Second output
OUTn	Output	Bit strings, integers, floating-point numbers, CHAR, TIME	I, Q, M, D, L	Optional outputs
ELSE	Output	Bit strings, integers, floating-point numbers, CHAR, TIME	I, Q, M, D, L	Output to which the input value (IN) is copied when K > n.

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on available data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Table 9- 22 Input values of the "Demultiplex" instruction before network execution

Parameters	Operand	Values	
K	Tag_Number	1	4
IN	Tag_Value	DW#16#FFFFFFFF	DW#16#3E4A7D

Table 9- 23 Output values of the "Demultiplex" instruction after network execution

Parameters	Operand	Values	
OUT0	Tag_Output_0	Unchanged	Unchanged
OUT1	Tag_Output_1	DW#16#FFFFFFFF	Unchanged
ELSE	Tag_Output_2	Unchanged	DW#16#3E4A7D

If the "Tag_Input" input has the signal state "1", the "Demultiplex" instruction is executed. Depending on the value of operand "Tag_Number", the value at the IN input is copied to the corresponding output.

Shift and rotate

SHR: Shift right

Description

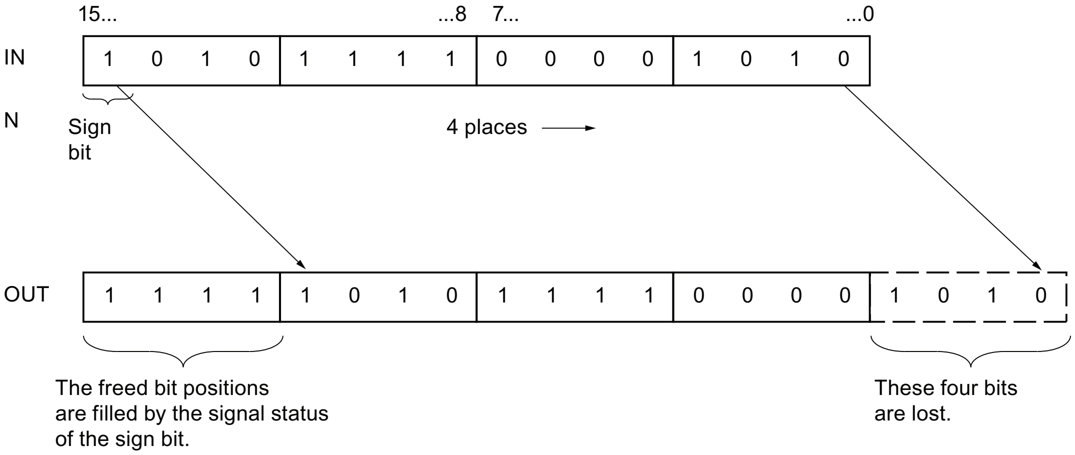
You can use the "Shift right" instruction to shift the content of the operand at the IN input bit-by-bit to the right and query the result at the OUT output. You use the N parameter to specify the number of bit positions by which the specified value is to be shifted.

When the value at the N parameter is "0", the value at the IN input is copied to the operand at the OUT output.

When the value at the N parameter is greater than the number of available bit positions, the operand value at the IN input is shifted by the available number of bit positions to the right.

In the case of unsigned values, the freed bit positions in the left area of the operand are filled with zeroes when shifting occurs. If the specified value has a sign, the free bit positions are filled with the signal state of the sign bit.

The following figure show how the content of an operand of integer data type is shifted four bit positions to the right:



The "Shift right" instruction is only executed if the signal state is "1" at the EN enable input. In this case, the ENO enable output also has the signal state "1".

If the signal state at the EN enable input is "0", the ENO enable output also has the signal state "0".

Parameters

The following table shows the parameters of the "Shift right" instruction:

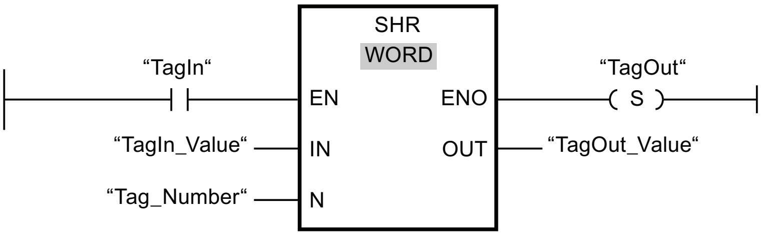
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers	I, Q, M, D, L or constant	Value to be shifted.
N	Input	UINT	I, Q, M, D, L or constant	Number of bit positions by which the value is shifted.
OUT	Output	Bit strings, integers	I, Q, M, D, L	Result of the instruction

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
N	Tag_Number	3
OUT	TagOut_Value	0000 0111 1111 0101

If operand "TagIn" has the signal state "1", the "Shift right" instruction is executed. The content of operand "TagIn_Value" is shifted three bit positions to the right. The result is sent to the "TagOut_Value" output. If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

See also

Overview of the valid data types (Page 741)

SHL: Shift left

Description

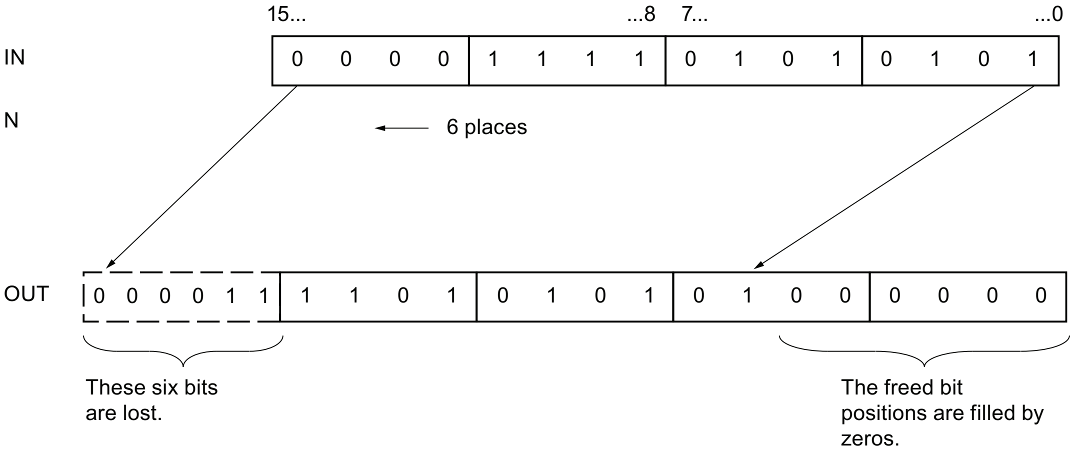
You can use the "Shift left " instruction to shift the content of the operand at the IN input bit-by-bit to the left and query the result at the OUT output. You use the N parameter to specify the number of bit positions by which the specified value is to be shifted.

When the value at the N parameter is "0", the value at the IN input is copied to the operand at the OUT output.

When the value at the N parameter is greater than the number of available bit positions, the operand value at the IN input is shifted by the available number of bit positions to the left.

The bit positions in the right part of the operand freed by shifting are filled with zeros.

The following figure shows how the content of an operand of WORD data type is shifted six bit positions to the left:



The "Shift left" instruction is only executed if the signal state is "1" at the EN enable input. In this case, the ENO enable output also has the signal state "1".

If the signal state at the EN enable input is "0", the ENO enable output also has the signal state "0".

Parameters

The following table shows the parameters of the "Shift left" instruction:

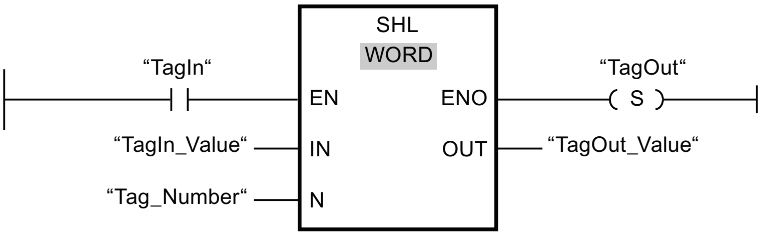
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers	I, Q, M, D, L or constant	Value to be shifted.
N	Input	UINT	I, Q, M, D, L or constant	Number of bit positions by which the value is shifted.
OUT	Output	Bit strings, integers	I, Q, M, D, L	Result of the instruction

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
N	Tag_Number	4
OUT	TagOut_Value	1111 1010 1111 0000

If operand "TagIn" has the signal state "1", the "Shift left" instruction is executed. The content of operand "TagIn_Value" is shifted four bit positions to the left. The result is sent to the "TagOut_Value" output. If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

ROR: Rotate right

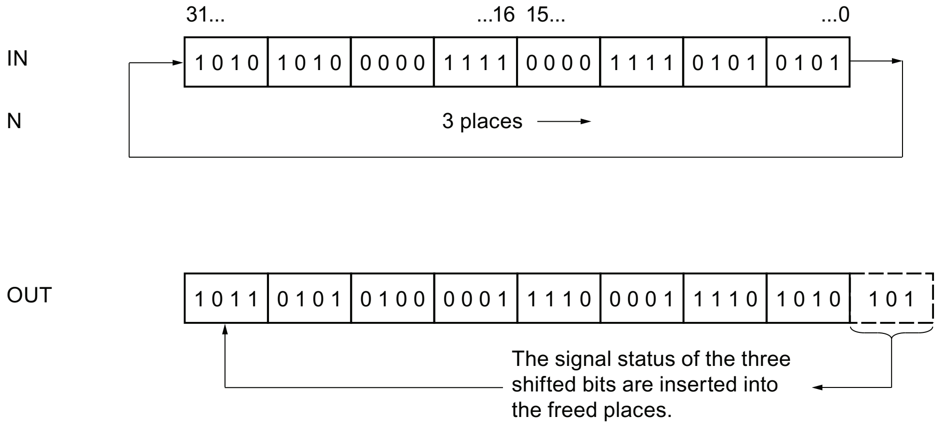
Description

The "Rotate right" instruction rotates the content of the operand at the IN input bit-by-bit to the right and queries the result at the OUT output. You use the N parameter to specify the number of bit positions by which the specified value is to be rotated. The bit positions freed by rotating are filled with the bit positions that are pushed out.

When the value at the N parameter is "0", the value at the IN input is copied to the operand at the OUT output.

When the value at the N parameter is greater than the number of available bit positions, the operand value at the IN input is nevertheless rotated by the specified number of bit positions.

The following figure shows how the content of an operand of DWORD data type is rotated three positions to the right:



The "Rotate right" instruction is only executed if the signal state is "1" at the EN enable input. In this case, the ENO enable output also has the signal state "1".

If the signal state at the EN enable input is "0", the ENO enable output also has the signal state "0".

Parameters

The following table shows the parameters of the "Rotate right" instruction:

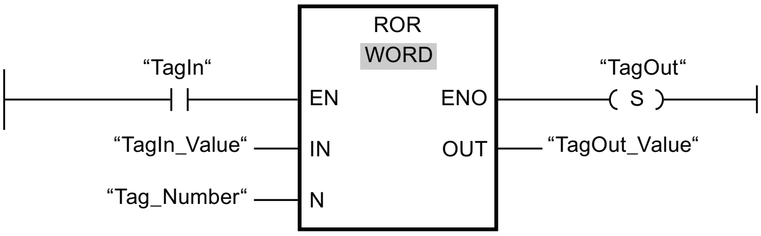
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings	I, Q, M, D, L or constant	Value to be rotated.
N	Input	UINT	I, Q, M, D, L or constant	Number of bit positions by which the value is rotated.
OUT	Output	Bit strings	I, Q, M, D, L	Result of the instruction

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	TagIn_Value	0000 1111 1001 0101
N	Tag_Number	5
OUT	TagOut_Value	1010 1000 0111 1100

If operand "TagIn" has the signal state "1", the "Rotate right" instruction is executed. The content of operand "TagIn_Value" is rotated five bit positions to the right. The result is sent to the "TagOut_Value" output. If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

ROL: Rotate left

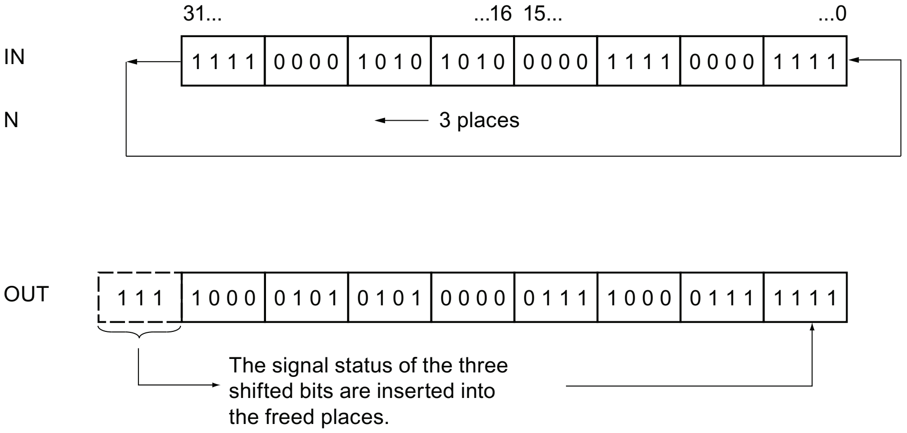
Description

The "Rotate left" instruction rotates the content of the operand at the IN input bit-by-bit to the left and queries the result at the OUT output. You use the N parameter to specify the number of bit positions by which the specified value is to be rotated. The bit positions freed by rotating are filled with the bit positions that are pushed out.

When the value at the N parameter is "0", the value at the IN input is copied to the operand at the OUT output.

When the value at the N parameter is greater than the number of available bit positions, the operand value at the IN input is nevertheless rotated by the specified number of bit positions.

The following figure shows how the content of an operand of DWORD data type is rotated three positions to the left:



The "Rotate left" instruction is only executed if the signal state is "1" at the EN enable input. In this case, the ENO enable output also has the signal state "1".

If the signal state at the EN enable input is "0", the ENO enable output also has the signal state "0".

Parameters

The following table shows the parameters of the "Rotate left" instruction:

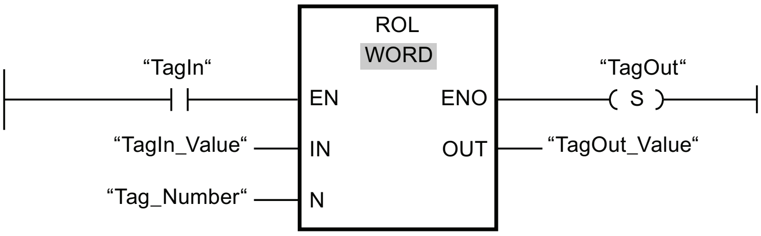
Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings	I, Q, M, D, L or constant	Value to be rotated.
N	Input	UINT	I, Q, M, D, L or constant	Number of bit positions by which the value is rotated.
OUT	Output	Bit strings	I, Q, M, D, L	Result of the instruction

You can select the data type for the instruction from the "<???>" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	TagIn_Value	1010 1000 1111 0110
N	Tag_Number	5
OUT	TagOut_Value	0001 1110 1101 0101

If the "TagIn" input has the signal state "1", the "Rotate left" instruction is executed. The content of operand "TagIn_Value" is rotated five bit positions to the left. The result is sent to the "TagOut_Value" output. If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

9.8.2.2 FBD

Bit logic operations

&: AND logic operation

Description

You can use the instruction "AND logic operation" to query the signal states of two or more specified operands and evaluate them according to the AND truth table.

If the signal state of all the operands is "1", then the condition is fulfilled and the instruction returns the result "1". If the signal state of one of the operands is "0", then the condition is not fulfilled and the instruction generates the result "0".

If the instruction "AND logic operation" is the first instruction in a logic string, it saves the result of its signal state query in the RLO bit.

Each "AND logic operation" instruction that is not the first operation in the logic sequence, logically combines the result of its signal state query with the value saved in the RLO bit. This logical combination is performed according to the AND truth table.

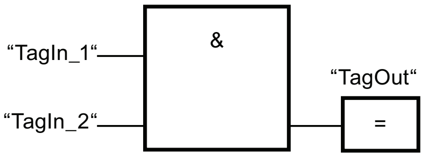
Parameter

The following table shows the parameters of the instruction "AND logic operation":

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, D, L	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



Output "TagOut" is set, when the signal state of the operands "TagIn_1" and "TagIn_2" is "1".

Results of the logic operation

The following table shows the results that arise from the AND logic operation of two operands:

Signal state of the first operand	Signal state of the second operand	Result of the logic operation
1	1	1
0	1	0
1	0	0
0	0	0

See also

&: AND logic operation (Page 1393)

>=1: OR logic operation

Description

You can use the instruction "OR logic operation" to query the signal states of two or more specified operands and evaluate them according to the OR truth table.

If the signal state of one of the operands is "1", then the condition is fulfilled and the instruction returns the result "1". If the signal state of all the operands is "0", then the condition is not fulfilled and the instruction generates the result "0".

If the "OR logic operation" instruction is the first instruction in a logic string, it saves the result of its signal state query in the RLO bit.

Each "OR logic operation" instruction that is not the first operation in the logic sequence, logically combines the result of its signal state query with the value saved in the RLO bit. This logical combination is performed according to the OR truth table.

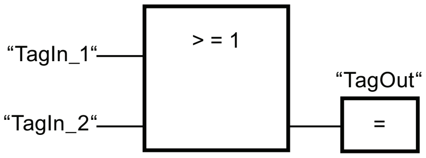
Parameter

The following table shows the parameters of the instruction "OR logic operation":

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, D, L	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



Output "TagOut" is set, when the signal state of the operands "TagIn_1" or "TagIn_2" is "1".

Results of the logic operation

The following table shows the results that arise from the OR logic operation of two operands:

Signal state of the first operand	Signal state of the second operand	Result of the logic operation
1	0	1
0	1	1
1	1	1
0	0	0

See also

>=1: OR logic operation (Page 1394)

X: EXCLUSIVE OR logic operation

Description

You can use the "EXCLUSIVE OR logic operation" instruction to query the result of a signal state query according to the EXCLUSIVE OR truth table.

With an "EXCLUSIVE OR logic operation" instruction, the signal state is "1" when the signal state of one of the two specified operands is "1". When more than two operands are queried, the common RLO is "1" if an odd number of the queried operands returns the result "1".

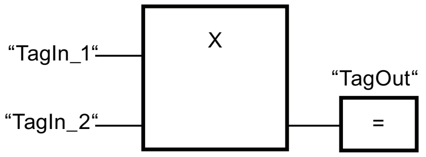
Parameter

The following table shows the parameters of the instruction "EXCLUSIVE OR logic operation":

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, D, L	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the signal state of the operands "TagIn_1" and "TagIn_2" is "1". When both operands return the signal state "1" or "0", the output "TagOut" is reset.

X: EXCLUSIVE OR logic operation (Page 1396)

Insert input

Description

The "Insert input" instruction is used to add an input to the box of one of the following instructions:

- "AND logic operation"
- "OR logic operation"
- "EXCLUSIVE OR logic operation"

You can query the signal state of several operands by the extension of an instruction box.

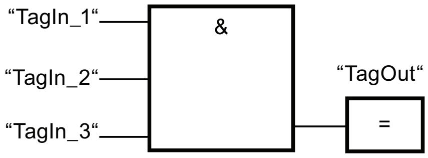
Parameter

The following table shows the parameters of the instruction "Insert input":

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, D, L	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



The box of the "AND logic operation" instruction was extended by an additional input at which the signal state of the operand "TagIn_3" is queried. Output "TagOut" is set, when the signal state of the operands "TagIn_1", "TagIn_2" and "TagIn_3" returns the signal state "1".

See also

&: AND logic operation (Page 1393)

>=1: OR logic operation (Page 1394)

X: EXCLUSIVE OR logic operation (Page 1396)

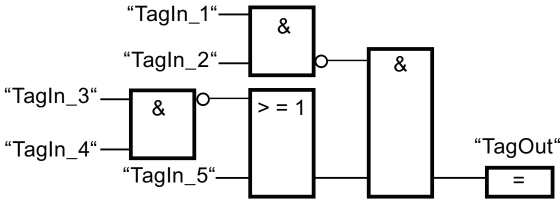
Invert RLO

Description

You use the "Invert RLO" instruction to invert the signal state of the result of logic operation (RLO).

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- The input "TagIn_1" and/or "TagIn_2" has signal state "0".
- The input "TagIn_3" and/or "TagIn_4" has signal state "0" or the input "TagIn_5" has signal state "1".

=: Assignment

Description

You can use the "Assignment" instruction to set the bit of a specified operand. If the result of logic operation (RLO) at the box input has the signal state "1", the specified operand is set to signal state "1". If the signal state at the box input is "0", the bit of the specified operand is reset to "0".

The instruction does not influence the RLO. The RLO at the box input is assigned directly to the operand above the assignment box.

The "Assignment" instruction can be placed at any position in the logic string.

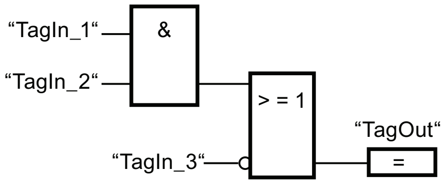
Parameter

The following table shows the parameters of the "Assignment" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand to which the RLO is assigned.

Example

The following example shows how the instruction works:



The operand "TagOut" is set at the output of the "Assignment" instruction when one of the following conditions is fulfilled:

- The inputs "TagIn_1" and "TagIn_2" have the signal state "1".
- The signal state at the input "TagIn_3" is "0".

See also

Overview of the valid data types (Page 741)

Example of detecting the fill level of a storage area (Page 1214)

Example of controlling room temperature (Page 1217)

/=: Negate assignment

Description

The "Negate assignment" instruction inverts the result of logic operation (RLO) and assigns this to the operand above the box. If the RLO at the input of the box is "1", the binary operand is reset. If the RLO at the input of the box is "0", the binary operand is set to signal state "1".

The instruction does not influence the RLO. The RLO at the box input is transferred directly to the box output.

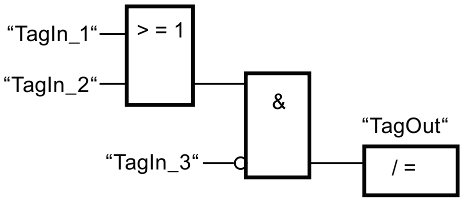
Parameters

The following table shows the parameters of the "Negate assignment" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand to which the negated RLO is assigned.

Example

The following example shows the mode of operation of the "Negate assignment" instruction:



The operand "TagOut" is reset when the following conditions are fulfilled:

- The operand "TagIn_1" or "TagIn_2" has the signal state "1".
- The operand "TagIn_3" has the signal state "0".

See also

Overview of the valid data types (Page 741)

R: Reset output

Description

You can use the "Reset output" instruction to reset the signal state of a specified operand to "0".

The instruction is only executed if the result of logic operation (RLO) at the box input is "1". If the box input has the signal state "1", the specified operand is reset to "0". If there is an RLO of "0" at the box input, the signal state of the specified operand remains unchanged.

Executing the instruction does not influence the RLO. The RLO at the box input is transferred directly to the box output.

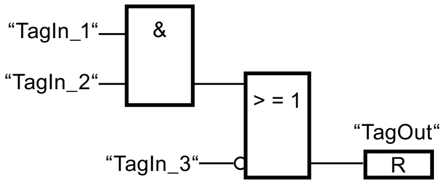
Parameters

The following table shows the parameters of the "Reset output" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand that is reset if RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is reset when one of the following conditions is fulfilled:

- The operands "TagIn_1" and "TagIn_2" have signal state "1".
- The operand "TagIn_3" has the signal state "0".

See also

Example of controlling a conveyor belt (Page 1211)

Example of detecting the direction of a conveyor belt (Page 1212)

S: Set output

Description

You can use the "Set output" instruction to reset the signal state of a specified operand to "1".

The instruction is only executed if the result of logic operation (RLO) at the box input is "1". If the box input has the signal state "1", the specified operand is set to "1". If there is an RLO of "0" at the box input, the signal state of the specified operand remains unchanged.

Executing the instruction does not influence the RLO. The RLO at the box input is transferred directly to the box output.

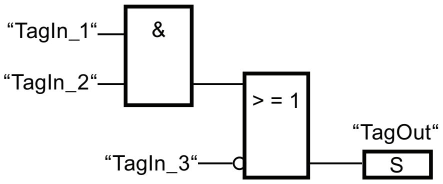
Parameters

The following table shows the parameters of the "Set output" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand that is set when RLO = "1".

Example

The following example shows how the instruction works:



The operand "TagOut" is reset when one of the following conditions is fulfilled:

- The operands "TagIn_1" and "TagIn_2" have signal state "1".
- The operand "TagIn_3" has the signal state "0".

See also

Overview of the valid data types (Page 741)

SET_BF: Set bit field

Description

You use the "Set bit field" instruction to set several bits starting from a certain address.

You use the N input to define the number of bits to be set. The address of the first bit to be set is defined by (<Operand>). If the value of the N input is greater than the number of bits in a selected byte, the bits of the next byte are set. The bits remain set until they are explicitly reset, for example, by another instruction.

The instruction executes only if the result of logic operation (RLO) at the EN input is "1". If the RLO at the EN input is "0", the instruction does not execute.

The "Set bit field" instruction can also be placed without preceding logic operation at the start or end of the logic string.

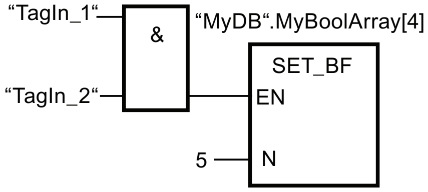
Parameter:

The following table shows the parameters of the "Set bit field" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
N	Input	UINT	Constant	Number of bits to be set
<Operand>	Output	BOOL	I, Q, M With a DB or an IDB, an element of an array [..] of BOOL	Pointer to the first bit to be set.

Example

The following example shows the mode of operation of the "Set bit field" instruction:



If the operands "TagIn_1" and "TagIn_2" have the signal state "1", 5 bits are set starting at the address of the operand "MyDB".MyBoolArray[4].

See also

Overview of the valid data types (Page 741)

RESET_BF: Reset bit field

Description

You use the "Reset bit field" instruction to re set several bits starting from a certain address.

You use the value of the N input to define the number of bits to be reset. The address of the first bit to be reset is defined by (<Operand>). If the value of the N input is greater than the number of bits in a selected byte, the bits of the next byte are reset. The bits remain set until they are explicitly reset, for example, by another instruction.

The instruction executes only if the result of logic operation (RLO) at the EN enable input is "1". If the RLO at the EN enable input is "0", the instruction does not execute.

The "Reset bit field" instruction can also be placed without preceding logic operation at the start or end of the logic string.

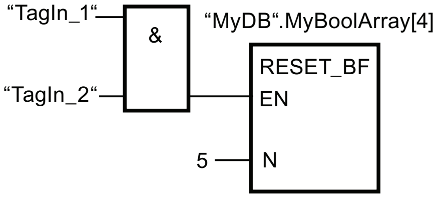
Parameters

The following table shows the parameters of the "Reset bit field" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
N	Input	UINT	Constant	Number of bits to be reset
<Operand>	Output	BOOL	I, Q, M With a DB or an IDB, an element of an array [..] of BOOL	Pointer to the first bit to be reset.

Example

The following example shows the mode of operation of the "Reset bit field" instruction:



If the operands "TagIn_1" and "TagIn_2" have the signal state "1", 5 bits are reset starting at the address of the operand "MyDB".MyBoolArray[4].

See also

Overview of the valid data types (Page 741)

SR: Set/reset flip-flop

Description

The "Set/reset flip-flop" instruction is used to set or reset the bit of a specified operand based on the signal state of the inputs S and R1. If the signal state is "1" at input S and "0" at input R1, the specified operand is set to "1". If the signal state is "0" at input S and "1" at input R1, the specified operand will be reset to "0".

Input R1 takes priority over input S. When the signal state is "1" on both inputs S and R1, the signal state of the specified operand is reset to "0".

The instruction is not executed if the signal state at the two inputs S and R1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

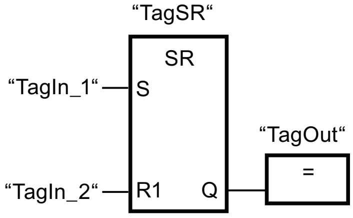
Parameters

The following table shows the parameters of the "Set/reset flip-flop" instruction:

Parameters	Declaration	Data type	Memory area	Description
S	Input	BOOL	I, Q, M, D, L	Enable setting
R1	Input	BOOL	I, Q, M, D, L	Enable resetting
<Operand>	Output	BOOL	I, Q, M, D, L	Operand that is set or reset
Q	Output	BOOL	I, Q, M, D, L	Signal state of the operand

Example

The following example shows how the "Set/reset flip-flop" instruction works:



The operands "TagSR" and "TagOut" are set when the following conditions are fulfilled:

- The operand "TagIn_1" has the signal state "1".
- The operand "TagIn_2" has the signal state "0".

The operands "TagSR" and "TagOut" are reset when one of the following conditions is fulfilled:

- The operand "TagIn_1" has signal state "0" and the operand "TagIn_2" has signal state "1".
- The operands "TagIn_1" and "TagIn_2" have signal state "1".

RS: Reset/set flip-flop

Description

The "Set/reset flip-flop" instruction is used to reset or set the bit of a specified operand based on the signal state of the inputs R and S1. If the signal state is "1" at input R and "0" at input S1, the specified operand will be reset to "0". If the signal state is "0" at input R and "1" at input S1, the specified operand is set to "1".

Input S1 takes priority over input R. When the signal state is "1" at both inputs R and S1, the signal state of the specified operand is set to "1".

The instruction is not executed if the signal state at the two inputs R and S1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

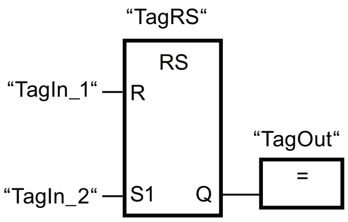
Parameters

The following table shows the parameters of the "Reset/set flip-flop" instruction:

Parameters	Declaration	Data type	Memory area	Description
R	Input	BOOL	I, Q, M, D, L	Enable resetting
S1	Input	BOOL	I, Q, M, D, L	Enable setting
<Operand>	Output	BOOL	I, Q, M, D, L	Operand that is reset or set.
Q	Output	BOOL	I, Q, M, D, L	Signal state of the operand

Example

The following example shows how the "Reset/set flip-flop" instruction works:



The operands "TagRS" and "TagOut" are reset when the following conditions are fulfilled:

- The operand "TagIn_1" has the signal state "1".
- The operand "TagIn_2" has the signal state "0".

The operands "TagRS" and "TagOut" are set when the following conditions are fulfilled:

- The operand "TagIn_1" has signal state "0" and the operand "TagIn_2" has signal state "1".
- The operands "TagIn_1" and "TagIn_2" have signal state "1".

P: Scan operand for positive signal edge

Description

The "Scan operand for positive signal edge" instruction is used to determine whether there is a "0" to "1" change in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of the operand with the signal state of the previous query saved in an edge memory bit (<Operand2>). If the instruction detects a change in the result of logic operation from "0" to "1", there is a positive, rising edge.

If a falling edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Specify the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit has to be located in a DB (static area for FB) or in the bit memory area.

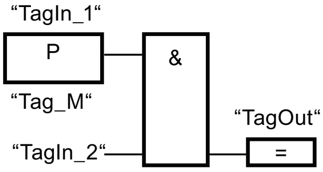
Parameters

The following table shows the parameters of the "Scan operand for positive signal edge" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Input	BOOL	I, Q, M, D, L	Signal to be scanned
<Operand2>	InOut	BOOL	I, Q, M, D, L	Edge memory bit in which the signal state of the previous scan is saved

Example

The following example shows how the "Scan operand for positive signal edge" instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- There is a rising edge at input "TagIn_1".
- The signal state of the operand "TagIn_2" is "1".

N: Scan operand for negative signal edge

Description

The "Scan operand for negative signal edge" instruction is used to determine whether there is a "1" to "0" change in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of the operand with the signal state of the previous query saved in an edge memory bit (<Operand2>). If the instruction detects a change in the result of logic operation from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Specify the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit has to be located in a DB (static area for FB) or in the bit memory area.

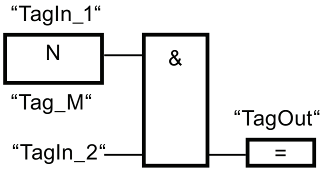
Parameters

The following table shows the parameters of the "Scan operand for negative signal edge" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Input	BOOL	I, Q, M, D, L	Signal to be scanned
<Operand2>	InOut	BOOL	I, Q, M, D, L	Edge memory bit in which the signal state of the previous scan is saved

Example

The following example shows how the "Scan operand for negative signal edge" instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- There is a falling edge at input "TagIn_1".
- The signal state of the operand "TagIn_2" is "1".

P=: Set operand on positive signal edge

Description

The "Set operand on positive signal edge" instruction is used to set a specified operand (<Operand2>) when there is a "0" to "1" change in the result of logic operation (RLO). The instruction compares the current result of logic operation with the result of logic operation from the previous query, which is saved in the edge memory bit (<Operand1>). If the instruction detects a change in the RLO from "0" to "1", there is a positive, rising edge.

When a positive edge is detected, <Operand2> is set to signal state "1" for one program cycle. In all other cases, the operand has the signal state "0".

You specify the operand (<Operand2>) to be set in the operand placeholder above the instruction. You specify the edge memory bit (<Operand1>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit has to be located in a DB (static area for FB) or in the bit memory area.

The instruction does not influence the RLO. The RLO at the input of the box is transferred directly to the output of the box.

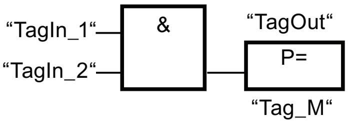
Parameters

The following table shows the parameters of the "Set operand on positive signal edge" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand1>	InOut	BOOL	I, Q, M, D, L	Edge memory bit
<Operand2>	Output	BOOL	I, Q, M, D, L	Operand which is set when there is a positive signal edge.

Example

The following example shows the parameters of the "Set operand on positive signal edge" instruction:



The "TagOut" output is set for one program cycle, when the signal state at the input of the instruction box switches from "0" to "1" (positive signal edge). In all other cases, the "TagOut" output has signal state "0".

N=: Set operand on negative signal edge

Description

The "Set operand on negative signal edge" instruction is used to set a specified operand (<Operand1>) when there is a "1" to "0" change in the result of logic operation (RLO). The instruction compares the current RLO with the RLO from the previous query, which is saved in the edge memory bit (<Operand2>). If the instruction detects a change in the RLO from "1" to "0", there is a negative, falling edge.

When a negative edge is detected, <Operand1> is set to signal state "1" for one program cycle. In all other cases, the operand has the signal state "0".

You specify the operand (<Operand1>) to be set in the operand placeholder above the instruction. Specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit has to be located in a DB (static area for FB) or in the bit memory area.

The instruction does not influence the RLO. The RLO at the input of the box is transferred directly to the output of the box.

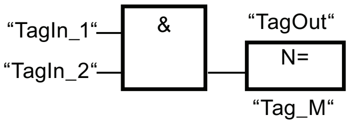
Parameters

The following table shows the parameters of the "Set operand on negative signal edge" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Output	BOOL	I, Q, M, D, L	Operand which is set when there is a negative signal edge.
<Operand2>	InOut	BOOL	I, Q, M, D, L	Edge memory bit

Example

The following example shows the mode of operation of the "Set operand on negative signal edge" instruction:



The operand "TagOut" is set for one program cycle if the signal state at the input of the instruction box changes from "1" to "0" (negative signal edge). In all other cases, the operand "TagOut" has the signal state "0".

P_TRIG: Scan RLO for positive signal edge

Description

The "Scan RLO for positive signal edge" instruction is used to query a "0" to "1" change in the signal state of the result of logic operation (RLO). The instruction compares the current signal state of the RLO with the signal state of the previous query, which is saved in an edge memory bit (<Operand>). If the instruction detects a change in the RLO from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit has to be located in a DB (static area for FB) or in the bit memory area.

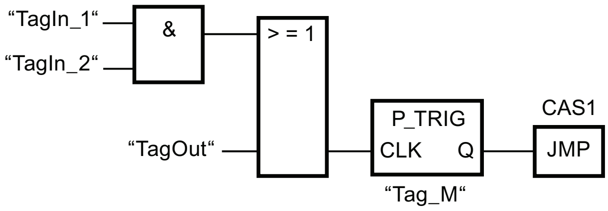
Parameters

The following table shows the parameters of the "Scan RLO for positive signal edge" instruction:

Parameters	Declaration	Data type	Memory area	Description
CLK	Input	BOOL	I, Q, M, D, L	Current RLO.
<Operand>	InOut	BOOL	I, Q, M, D, L	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	I, Q, M, D, L	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO of the preceding bit logic operation is saved in the edge memory bit "Tag_M". If a "0" to "1" change is detected in the signal state of the RLO, the program jumps to jump label CAS1.

Overview of the valid data types (Page 741)

N_TRIG: Scan RLO for negative signal edge

Description

The "Scan RLO for negative signal edge" instruction is used to query a "1" to "0" change in the signal state of the result of logic operation (RLO). The instruction compares the current signal state of the RLO with the signal state of the previous query saved in the edge memory bit (<Operand>). If the instruction detects a change in the RLO from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit has to be located in a DB (static area for FB) or in the bit memory area.

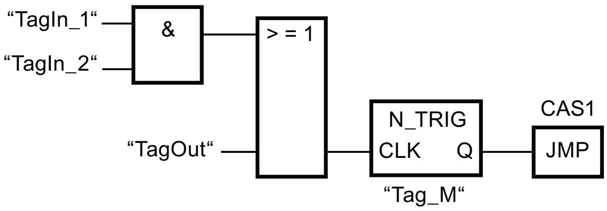
Parameters

The following table shows the parameters of the "Scan RLO for negative signal edge" instruction:

Parameters	Declaration	Data type	Memory area	Description
CLK	Input	BOOL	I, Q, M, D, L	Current RLO
<Operand>	InOut	BOOL	I, Q, M, D, L	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	I, Q, M, D, L	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO of the preceding bit logic operation is saved in the edge memory bit "Tag_M". If a "1" to "0" change is detected in the signal state of the RLO, the program jumps to jump label CAS1.

Timer operations

TP: Generate pulse

Description

The "Generate pulse" instruction is used to set the Q output for the configured time duration PT. The instruction is started when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive edge). The configured time duration PT begins when the instruction starts. Output Q is set for the time duration PT, regardless of the subsequent course of the input signal (postive edge). Even if a new rising signal edge is detected, the signal state at the output Q is not affected as long as the PT time duration is running.

The current time value can be queried at the ET output. The time value starts at T#0s and ends when the value of the time duration PT is reached. If the configuerd time duration PT is reached and the signal state at input IN is "0", the ET output is reset.

Each call of the "Generate pulse" instruction must be assigned to an IEC timer in which the instruction data is stored. An IEC timer is a structure of the data type IEC_TIMER or TP that you can declare as follows:

- Declaration of a data block of system data type IEC_TIMER (for example, "MyIEC_TIMER")
- Declaration as a local tag of the type TP in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic refer to "See also".

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. The query of the data is only identical from the call of the instruciton to the next call of the instruction.

The execution of the "Generate pulse" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

Parameters

The following table shows the parameters of the "Generate pulse" instruction:

Parameters	Declaration	Data type	Memory area	Description
IN	Input	BOOL	I, Q, M, D, L	Start input
PT	Input	TIME	I, Q, M, D, L or constant	Duration of the pulse. The value of the PT parameter must be positive.

Parameters	Declaration	Data type	Memory area	Description
Q	Output	BOOL	I, Q, M, D, L	Pulse output
ET	Output	TIME	I, Q, M, D, L	Current time value

For additional information on valid data types, refer to "See also".

TON: Generate on-delay

Description

The "Generate on delay" instruction is used to delay the setting of the Q output for the configured time duration PT. The instruction is started when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive edge). The programmed time duration PT begins when the instruction starts. When the time duration PT expires, the output Q has the signal state "1". Output Q remains set as long as the start input is still "1". When the signal state at the start input changes from "1" to "0", the Q output is reset. The timer function is started again when a new rising edge is detected at the start input.

The current time value can be queried at the ET output. The time value starts at T#0s and ends when the value of the time duration PT is reached. The ET output is reset as soon as the signal state at the IN input changes to "0".

Each call of the "Generate on-delay" instruction must be assigned to an IEC timer in which the instruction data is stored. An IEC timer is a structure of the data type IEC_TIMER or TON that you can declare as follows:

- Declaration of a data block of system data type IEC_TIMER (for example, "MyIEC_TIMER")
- Declaration as a local tag of the type TON in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic refer to "See also".

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. The query of the data is only identical from the call of the instruciton to the next call of the instruction.

The execution of the "Generate on-delay" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

Parameters

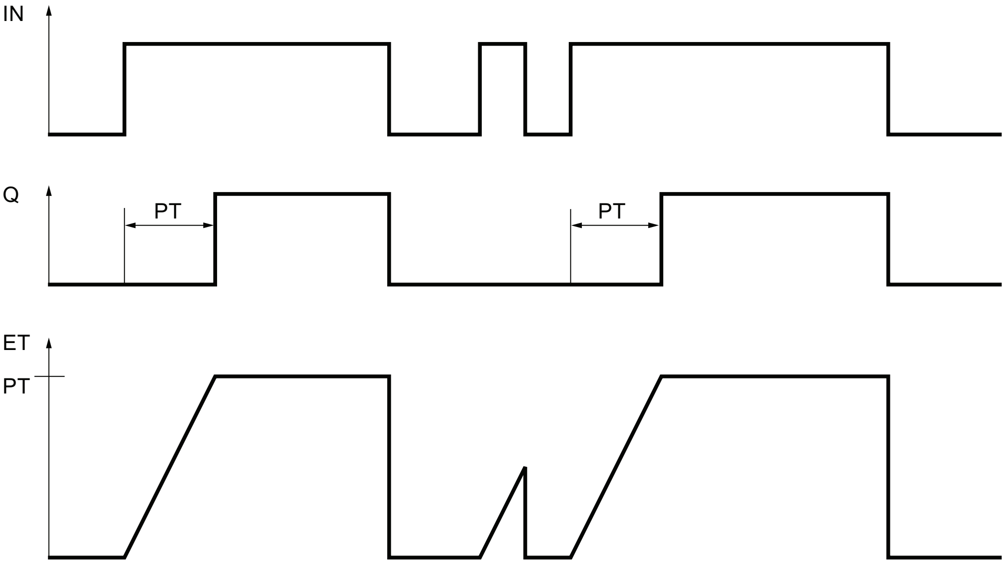
The following table shows the parameters of the "Generate on-delay" instruction:

Parameters	Declaration	Data type	Memory area	Description
IN	Input	BOOL	I, Q, M, D, L	Start input
PT	Input	TIME	I, Q, M, D, L or constant	Duration of the on delay. The value of the PT parameter must be positive.
Q	Output	BOOL	I, Q, M, D, L	Output that is set when the time PT expires.
ET	Output	TIME	I, Q, M, D, L	Current time value

For additional information on valid data types, refer to "See also".

Pulse diagram

The following figure shows the pulse diagram of the "Generate on-delay" instruction:



See also

Overview of the valid data types (Page 741)

TOF: Generate off-delay

Description

The "Generate off-delay" instruction is used to delay the resetting of the Q output for the configured time duration PT. The Q output is set when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive signal edge). When the signal state at input IN changes back to "0" (positive signal edge), the configured time duration PT starts. Output Q remains set as long the time duration PT is running. When the time PT expires, the Q output is reset. If the signal state at the IN input changes to "1" before the time duration PT expires, the time is reset. The signal state at the output Q will continue to be "1".

The current time value can be queried at the ET output. The time value starts at T#0s and ends when the value of the time duration PT is reached. When the time PT expires, the ET output remains set to the current value until the IN input changes back to "1". If input IN switches to "1" before the time duration PT expires, the ET output is reset to the value T#0s.

Each call of the "Generate off-delay" instruction must be assigned to an IEC timer in which the instruction data is stored. An IEC timer is a structure of the data type IEC_TIMER or TOF that you can declare as follows:

- Declaration of a data block of system data type IEC_TIMER (for example, "MyIEC_TIMER")
- Declaration as a local tag of the type TOF in the "Input", "InOut" or "Static" section of a block (for example, #MyIEC_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic refer to "See also".

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. The query of the data is only identical from the call of the instruciton to the next call of the instruction.

The execution of the "Generate off-delay" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

Parameters

The following table shows the parameters of the "Generate off-delay" instruction:

Parameters	Declaration	Data type	Memory area	Description
IN	Input	BOOL	I, Q, M, D, L	Start input
PT	Input	TIME	I, Q, M, D, L or constant	Duration of the off delay. The value of the PT parameter must be positive.
Q	Output	BOOL	I, Q, M, D, L	Output that is reset when the timer PT expires.
ET	Output	TIME	I, Q, M, D, L	Current time value

For additional information on valid data types, refer to "See also".

Pulse diagram

The following figure shows the pulse diagram of the "Generate off-delay" instruction:
